Notes on Transliteration

Transliteration is always a problem when dealing with a non-Roman alphabet across such a vast span of time and space, and it is as impossible to please everybody as it is to be consistent within the rules one has set. But, on the principle that good transliteration like good writing is by definition inconspicuous, the aim throughout has been to present the reader with the form of any word which is likely to be the most familiar and least jarring. In general, ancient names have been presented in their “Latin” form (e.g., Thucydides), but medieval and modern names in their “Greek” form (e.g., Alexios I Komnenos). Since a point in time had to be chosen for the switch from “Latin” to “Greek” forms, that (entirely arbitrary) moment is taken to be the death of Justinian I (14 November, 565) who was probably the last Byzantine emperor to speak Latin. Greek is always transliterated into the Roman alphabet. Here again the more usual “ancient” system (e.g., *basileus*) is employed. Places that have a standard ancient (or English) form (such as Thessalonica or Athens) retain that form throughout. Nevertheless, inconsistencies and infelicities are inevitable and we can only crave the reader’s indulgence where they occur.

GRAHAM SPEAKE

The Greek Alphabet

<i>Capital</i>	<i>Lower Case</i>	<i>Name</i>		<i>Transliteration (pre-1453/post-1453)</i>
A	α	Alpha	=	<i>a</i>
B	β	Beta	=	<i>b/v</i>
Γ	γ	Gamma	=	<i>g</i>
Δ	δ	Delta	=	<i>d</i>
E	ε	Epsilon	=	<i>e</i> (as e in “net”)
Z	ζ	Zeta	=	<i>z</i>
H	η	Eta	=	<i>e</i> (as ee in “meet”)
Θ	θ	Theta	=	<i>th</i>
I	ι	Iota	=	<i>i</i>
K	κ	Kappa	=	<i>k</i>
Λ	λ	Lambda	=	<i>l</i>
M	μ	Mu	=	<i>m</i>
N	ν	Nu	=	<i>n</i>
Ξ	ξ	Xi	=	<i>x</i>
O	ο	Omicron	=	<i>o</i> (as o in “spot”)
Π	π	Pi	=	<i>p</i>
P	ρ	Rho	=	<i>rh, r</i>
Σ	σ ς	Sigma	=	<i>s</i> (ς when final letter)
T	τ	Tao	=	<i>t</i>
Υ	υ	Upsilon	=	<i>u/f</i> after <i>a</i> and <i>e</i>
Φ	φ	Phi	=	<i>ph</i>
X	χ	Chi	=	<i>ch</i> (hard, as in “chord”)
Ψ	ψ	Psi	=	<i>ps</i>
Ω	ω	Omega	=	<i>o</i> (as o in “lone”)

Preface

The credit for designing and seeing through the press the original edition of this Encyclopaedia belongs to Graham Speake. His aim was to produce a work of reference on all matters connected with Greece from the earliest times up to the present day. The wealth and variety of topics to be treated was daunting, but he succeeded in achieving comprehensive coverage without making the finished product seem too long or cumbersome.

This new version results from the realisation that there is also a place for a shorter work covering the same wide range of themes but concentrating on the ancient or classical world. This newly defined scope entails the need to determine what the lower chronological limit should be. Classical Greece used to be thought of as a culture chiefly remarkable for its achievements between the time of Homer and the death of Alexander. But for some considerable time now it has been recognised that what happened in the following centuries is by no means unworthy of our attention. Though scholars have differed in their views of when antiquity came to an end, for our purpose it seems appropriate to see the decisive change in the fourth century AD, when the appeal of paganism waned and the now largely Christian population of the Greco-Roman world became conscious that it belonged to a different culture. It is of course difficult when preparing a substantially revised or abbreviated version of a reference book to draw a rigid boundary. In the present case the most obvious problem was to decide about entries for prominent figures in the early Christian church, especially the apologists who engaged in controversy with the pagans. There is a similar difficulty regarding occasional notable representatives of paganism, such as the emperor Julian the Apostate or the rhetorician Libanius, who lived after the general acceptance of the new religion. I have thought it right from time to time not to eliminate references to later events if by retaining them one can help to give a proper sense of historical perspective.

While a large number of articles from the original edition are reprinted without change, others have been abbreviated as appropriate. There are a few modifications of detail. These include changes in some geographical names; for instance Corfu becomes Corcyra. On the other hand by no means all modern names disappear, because a reader who is uncertain about ancient place names will find it helpful to be able to turn to entries such as those on Libya and the

Ukraine for a survey of the ancient settlements of the Greeks in those areas.

NIGEL WILSON

As in every quality reference work, an encyclopedia must provide readers with many ways to find the information they seek and the opportunity to discover information they did not know existed. To do this the *Encyclopedia of Ancient of Greece* invites readers to explore its contents through various points of entry. All contents are arranged alphabetically to allow users to look up and find the desired articles with ease. Contents are also listed thematically to encourage users to explore articles that treat similar topics, ranging from articles on events and periods, cities and regions, and individuals to articles discussing social history, cultural history, political and military history, religious history, and economic history, to articles covering science, medicine, and philosophy. A list of individuals is arranged in chronological order to situate their contributions within the history of ancient Greece. Most important, the encyclopedia is equipped with a comprehensive analytical index that guides readers through the entire contents, directing them to the many places where issues of interest are discussed, and pointing them to new areas pertaining to their search. At the end of each article, readers will find lists of an author's writings and a bibliography of further readings that supplies a starting point for researching a topic in greater depth.

Abortion

Like other ethnic groups in the ancient Mediterranean area, the Greeks afforded the community's protection of law after a child was accepted by the father in a naming ceremony called the *amphidromia*. At any time prior to that event the foetus or child could be killed with impunity and usually without adverse moral judgement.

Abortion was practised through both chemical and surgical procedures. The latter was considered more dangerous and, consequently, most of the anecdotal and medical data refer to drugs, usually taken orally. Only after Christianity was established did this cultural pattern change and even then not dramatically. In pre-Christian Hellenic and Hellenistic societies abortion was regarded as a normal exercise of a woman. The exception was the moral and sometimes legal obligation to bear a child in wedlock when the father wanted the progeny. In Christian Greek- and Latin-speaking communities a woman was free to terminate what we regard as an early pregnancy, but not after she declared herself pregnant or when the foetal development made pregnancy obvious.

Contraception, abortion, and infanticide (provided it was before the ceremonial acceptance into the family) were means to limit family sizes as well as to dispose of unwanted, illegitimate, or deformed children. Exposed babies could be given or sold to slave traders. Hesiod (*fl.* c.700 BC) warns families not to have more than one son. Socrates said that midwives – his own mother was one – knew the drugs to “cause miscarriages if they think them desirable” (Plato, *Theaetetus*, 149d). Aristotle spoke of unspecified drugs to prevent children “before sense and life have begun in the embryo” (*Politics*, 7. 14. 10/1335b). In much the same way Plato voiced the same sentiments for public policy in the ideal state to limit unneeded children. A later report that the lawgivers of Athens and Sparta, Solon and Lycurgus, prohibited abortions is not regarded as authentic. Instead it was merely a reflection of sentiments in the 2nd century AD when Galen made the claim.

The medical writings beginning with those attributed to Hippocrates have prescriptions for causing an abortion. Sometimes they were not explicitly stated for an abortion but for stimulation of the onset of menstruation, although the function was to terminate, in our vocabulary, an early pregnancy. Such plants as the rue, pennyroyal, myrrh, juniper, and birthwort (*Aristolochae*) were among those

commonly employed. Birthwort was considered suitable for late-term abortions or, similarly, to initiate labour for delayed childbirth.

The modern question of “when does life begin” was not formulated in ancient Greek society with the meaning we give to it. Plutarch said that Plato regarded the foetus as a living being, but nevertheless Plato recommended abortions for women over 40. Aristotle’s biological observations on foetal development, mostly observed with birds’ eggs, influenced later Christian theological thinking. Knowing that an accident or Caesarian birth can result in a live birth, Aristotle asked when the foetus developed independent life. Although he did not consistently answer the question in the same way, one of his answers heavily influenced later philosophical and religious attitudes towards abortion. When the foetus had all of its form, Aristotle said that it had *psyche*, meaning “life”. The Stoics developed the notion of “soul” for which they employed the word *psyche*. The Christians, when reading Aristotle, thought that his question was not when independent life was expected but ensoulment. The only explicit reference to abortion in the Bible or Torah occurs in Exodus 21:23 in answer to a question about the fault of a person assaulting a pregnant woman with a miscarriage resulting. The answer was “life is for life”. The Hebrew word for life, *nefesh*, was translated by the Septuagint as *psyche*, thus the implication in late, Classical Greek to give a “soul for a soul” as punishment for the act. Most of the Church Fathers adapted Aristotle’s views and believed that ensoulment came at that point in a pregnancy when there was foetal movement. They envisioned the soul to have come from God, not the parents, and the divine act came when the foetus was formed. Prior to ensoulment a woman was free to terminate her fertility by returning to her menstrual cycle.

Not all pre-Christian or pagan Greeks subscribed to faultless abortion. For example, a Greek inscription above a sanctuary in Lydia (north Africa) prohibits entry to those who commit contraception, abortion, or infanticide. In its early version the Hippocratic Oath forbade a physician from prescribing an abortive pessary. The 2nd-century AD gynaecology writer Soranus explained that pessaries were more dangerous than oral-route drugs, and thus to be avoided. By late Hellenistic and Roman periods, however, some versions of the oath excised the word for pessary, thereby alleging that a physician was prohibited from the administration of any kind of abortion. Probably no version of the oath was actually taken by physicians in ancient or Byzantine times, but physicians were no doubt aware of the ethical values espoused.

The Stoics asserted that life began with the taking in of the first breath of cold air, but some Stoics argued that the foetus had the potential for life. No writings of Greek Stoics speak directly on

abortion, but later Stoics asserted that intercourse should only be for procreation. Writing in the late 3rd century, Porphyry discussed the question of when the soul enters the new being and answered that it may be as early as when the sperm enters the womb. Porphyry's answer (among others he proposed) was not accepted in Greek culture until the latter part of the 19th century.

In the Hellenistic and Byzantine periods some modifications were made to the ancient formula regarding abortion after foetal formation. The Gnostics regarded intercourse of any kind under any circumstances as wrong. The hateful *pharmakia* ("drugs") in biblical and early Christian works (e.g. Galatians 5:20 and *Didache*, 5. 1) are oblique references to abortifacients.

Academy of Athens

Philosophical school founded by Plato

The Academy was a public gymnasium in Athens, sacred to the hero Academus. It was located northwest of Athens, near the Dipylon gate. Plato founded his school there about 388/87 BC when he returned to Athens from his travels in Sicily. He acquired a house with a garden where Mithridates later set up a statue of him and where Speusippus, Plato's nephew and successor, erected statues of the Muses. We do not know much about the organization and legal status of the Academy. Although Plato was not the first to found a school of secondary education in Athens, his school had certain distinctive characteristics. Membership of the Academy was not the exclusive privilege of the few; nor did it presuppose adherence to certain doctrines. Plato did not charge his students – who included women – a fee. Mainly responsible for the teaching was the scholarch, but other senior members could lecture too. Subjects taught, apart from philosophy, included mathematics, astronomy, and natural science. An insight into the activity of the Academy is offered by a fragment of the comic

writer Epicrates (4th century).

Unlike the founders of other schools (Socratics, sophists), Plato made provision for the continuation of the school after his death (347 BC), by appointing Speusippus as his successor. His school was maintained until the 1st century BC, enjoying an unbroken line of elected successors. Already the ancients distinguished two main phases in the history of the Academy: (1) the Old Academy from Speusippus to Crantor, and (2) the New Academy from Arcesilaus to Philo of Larissa. Later, doxographers make further divisions, often distinguishing four or five phases. The first phase is that of doctrinal Platonism, whereas with Arcesilaus (316–240 BC) the Academy enters a period of scepticism which gradually became less radical. Unfortunately not a single extant work survives from Plato's successors. Thus our knowledge of the development of Platonic philosophy is often shadowy. Figures who were regarded as crucial for later developments such as Polemo (scholarch 314 –276 BC) remain entirely obscure to us. Yet our knowledge of the succession is firm thanks to a variety of ancient sources, notably a papyrus from Herculaneum (*Index Academicus*).

Speusippus had a strong interest in logic and mathematics. He elaborated Plato's theory of division and developed a theory of definition. Speusippus argued for the separate existence of numbers as immutable and eternal objects of knowledge preferable to Plato's ideas. He admitted two opposite principles: the One and the multiplicity. Yet these principles are not universal for the several kinds of substances, but each of them has its own principles. In Aristotle's view this lack of ultimate principles deprives the world of internal order and fails to account for a final cause. As regards ethics, Speusippus maintained that both pleasure and pain should be avoided as they are disturbances. Xenocrates (scholarch 339–314 BC), as we can infer from his list of writings, had a strong interest in moral philosophy, while he was also interested in giving a systematic account of the nature of gods and demons and their relation to heavenly bodies. With Polemo the interest in moral questions predominates. Crates and Crantor apparently continued Polemo's line. Crantor became renowned for his treatise "On Grief " and for composing the first commentary on a Platonic dialogue, namely the *Timaeus*.

The term "New Academy" bears a critical overtone. It was first coined by Antiochus of Ascalon (1st century BC) in order to criticize the sceptical Academy as diverging from a dogmatic Plato. Arcesilaus introduced scepticism into the Academy appealing to Socrates' aporetic method. The aim now was to challenge dogmatic doctrines dialectically. Neither Arcesilaus nor his most important successor

Carneades (c.214 –129 BC) wrote anything; their positions were expounded by their successors, Lacydes and Clitomachus respectively. Arcesilaus questioned Stoic claims that firm knowledge is attainable through sense impressions, arguing that no sense impression is such that it cannot be false. Arcesilaus' alternative to holding mere beliefs was to postulate suspension of judgement as the safest way to avoid error. Carneades systematically questioned dogmatic arguments, insisting on the impossibility of distinguishing cognitive from non-cognitive impressions. He maintained that suspension of judgement still allows for action; we can follow plausible impressions, but we do not have to assent to them.

Philo of Larissa was to be the last scholarch of the Academy. He succeeded Clitomachus around 110 BC, but with the occupation of Athens by Sulla in 89/88 BC he fled to Rome where he continued to teach for about a decade until his death. Philo started as a faithful follower of Carneadian scepticism, but later he reinterpreted it as allowing for formation of philosophical judgements. He maintained that things are actually knowable but we lack a criterion of truth such as the Stoic one, and he argued that this position was being held in the Academy all along, thus presenting the early Academic scepticism of Arcesilaus and his followers as being a reaction to Stoic dogmatism. Antiochus, Philo's disciple, found Philo's new position infuriating. He withdrew from the Academy, reproaching the "New" (i.e. sceptical) Academy as an aberration of Plato's philosophy. He himself propounded the revival of the "Old" Academy, claiming adherence to the ancients. Interestingly Antiochus included among the ancients Aristotle and the early Peripatetics, and argued for an essential agreement between the Academy and the early Peripatos. He also thought that the Stoics were in many respects in accord with the ancients exactly because they borrowed so much from them, only modifying their terminology. Yet Antiochus failed to restore the Old Academy. His philosophical outlook was heavily Stoic; his epistemology was essentially Stoic and his ethics more Peripatetic than Stoic. Antiochus never became scholarch of the Academy; he taught in his own school in the Ptolemaion gymnasium in Athens, while the Academy was abandoned after Sulla's sack of Athens. Antiochus' own school did not last long either.

There is no evidence of any philosophical activity in the Academy in the subsequent centuries. The term "Academic" now meant "sceptic", contrasted to "Platonic" which first applied to Thrasyllus (1st century AD), the editor of Plato's works in tetralogies. Plutarch, however, tried to restore the original meaning of the term "Academic" and defended the aporetic character of Plato's thought. A formal institution of Platonism no longer existed and there were no successors of Plato.

Individual Platonists taught their students in their own schools, located either in a gymnasium or in their own house. This was the case with Ammonius and his disciple Plutarch (1st century AD) and also with Taurus (2nd century). In AD 176 the Roman emperor Marcus Aurelius set up chairs for teachers of philosophy in Athens, and Atticus was probably the first incumbent of the Platonist chair. Plotinus (3rd century AD) taught in Rome in an establishment provided by a rich patron, while later Neoplatonists taught in Alexandria, Syria, and Athens. The Athenian school of Neoplatonism established successions. Proclus (5th century) claimed descent from Plato; and Damascius (6th century) argued for an unbroken “Golden Chain” of successors from the time to Plato to himself. But this was a historical illusion propagated by the Athenian Neoplatonists to lend authority to their own school, which was not located in the gymnasium of the Academy. The closure of the Academy by Emperor Justinian in 529 did not stop all philosophical activity. Simplicius and Olympiodorus wrote most of their works after that date.

Acarnania

Region in western Greece

The Ambracian gulf and the Ionian sea formed Acarnania's northern and western borders, while its border with Aetolia, to the east and south, was less stable. Mount Thyamus and the Achelous river, however, are usually considered the limits of the ancient Acarnanian state. Its most populous region was the plain of the Achelous, commanded by the town of Stratus. The increased excavation activity in Acarnania contributes to a more precise definition of its historical outline. However, issues concerning the provenance of its earliest inhabitants, the role they played in Greek history, and the development of its political institutions are still insufficiently understood due to the small number of comprehensive studies dealing with the region.

Little is known about Acarnania before its colonization by the Corinthians in the 7th century BC; in epic poetry there are references to the region, though without mentioning its name, as the kingdom of the cruel king Echetos. Information on the prehistoric inhabitants of Acarnania, the Taphians, Teleboans, Leleges, and Kouretes, is also vague. It seems that the region was not heavily populated in the Bronze Age; all the sites of this period are located in the region of Astacus, while there is a remarkable absence of Bronze Age sites along the coast.

The Acarnanians of the early historical period moved into the region at the time of, or a little after, the Dorian migration and spoke a northwest Greek dialect, characteristics of which have been traced to Illyria and Epirus. Before the arrival of Corinthian colonists, there was a settlement at Oeniadae. According to a myth narrated by Thucydides, an oracle directed Alcmaeon, Amphiarus' son, to establish it after his act of matricide. Thus Alcmaeon became the first ruler of this area and his son Acarnan gave his name to the people. The Corinthians colonized primarily the northwest of the territory (Leucas, Anactorium, Sollium) despite native opposition. Consequently, Corinthian artistic influence has been observed in Acarnania during the Archaic period.

Although Acarnania as a whole did not play an active role in the events of the Greek world, at least until the 4th century BC, it was involved in many wars because of its strategic position along the western sailing route to Italy. It was only the Corinthian colonies, Leucas, Anactorium, and Ambracia, which participated in the Persian Wars, sending contingents to Salamis and Plataea. In the middle of the 5th century BC contacts between Acarnania and Athens were developed, as the latter began to expand its sphere of influence in the west of Greece. With the aid of Athens the Acarnanians managed to subdue the Corinthian colonies on their coast. Being in alliance with Athens, they became involved in the Peloponnesian War and sent forces to Sicily in aid of Demosthenes.

By the mid-5th century BC the notion of *ethnos* (nation) existed among the Acarnanians as is demonstrated by the common defence of towns in cases of external attack. The individual poleis were organized into a federal state, the Acarnanian *koinon*, but they retained their autonomy. Each of them contributed troops for the defence of Acarnania, while an official body was located at Stratus from the 4th century BC. The earliest coins of the federal state were issued around 350 BC. The economy of the region was still agriculturally based in the 5th century BC; the production of grapes, olives, wheat, and barley and the keeping of livestock served local consumption, while there are no indications of interstate trade on a regular basis. The strong commercial presence of Corinth is reflected in the adoption of Corinthian coinage from the end of the 6th to the 3rd century BC.

In the Corinthian war (395 BC) Acarnania sided with Athens and its allies against the Lacedaemonians. In 390 BC the Spartan king Agesilaus II attacked Acarnania, which consequently allied with Sparta. Under the threat posed by Philip II of Macedon, the Acarnanians joined the second Athenian Confederacy and fought against him at Chaeronea (338 BC). Macedonia, however, soon replaced Athens as the Acarnanians' ally and protector, especially against Aetolia.

An Acarnanian-Macedonian alliance was encouraged by Cassander in 324 BC, in order to prevent Antigonos' activity in Aetolia which threatened the Macedonian ruler. In 314 BC the Acarnanian communities near the Aetolian border agreed to concentrate in the larger cities. In 294 BC Alexander IV ceded some rights over Acarnania to Pyrrhus in return for military assistance. During the years of Pyrrhus' rule Acarnania was prosperous because of the flow of trade from Greece to south Italy and Sicily and the temporary peace with Aetolia. This peace did not last long and frontier disputes with the Aetolians resulted in the dissolution of the Acarnanian *koinon* and the partition of Acarnania between them and the Epirotes around 252–

250 BC.

In 231 BC, after the end of the war between Aetolia and Macedonia (239–234 BC), the Acarnanians managed to regain control of their territory and a year later to reestablish their league. They acquired from Epirus the island of Leucas which became their capital. The main target of the new federation's policy was the liberation of the Acarnanian communities under Aetolian control. Antigonos Doson and Philip V supported the league. In 219 BC Philip campaigned along the Aetolian–Acarnanian border and recovered Phoetiae and Oeniadae. At the end of the summer in 217 BC peace was agreed between Philip and the Aetolians at Naupactus.

The Acarnanians sided with Philip against Rome (200 BC) and as a result Leucas was separated from the *koinon* and Thyrraeion became the new capital. The Acarnanian confederacy survived until 31–29 BC, but the coastal cities suffered from pirate raids and the whole region from the Roman civil wars. Following the battle of Actium (31 BC) the country was ravaged by Octavian, and its inhabitants settled in Nicopolis (founded 30 BC.)

Achaea

Region in the Peloponnese

Achaea is located in the northwest of the Peloponnese, between Elis and Sicyon, in the restricted land space between the Corinthian Gulf and the mountains. The region is relatively well watered and wooded, especially in its southern portion. Its three highest peaks, Panahaiko, Erimanthos, and Aroaneia, all located in the south, are dotted with numerous attractive villages. Coastal towns in the north are separated by small bays.

Evidence for early settlement in the region includes material remains from the Neolithic, Middle Helladic, and Late Helladic eras. Vestiges of Mycenaean occupation are found in both textual accounts and archaeological data. According to Homer (*Iliad*, 2. 574) Aigion, east of Patras, was part of Agamemnon's territory. And, indeed, archaeological discoveries at Aigion include a fairly extensive Late Helladic necropolis. Pausanias reported a variety of stories connecting the region with ancient Mycenaean, Dorian, and Ionian traditions. According to his description of the upheaval following the decline of the Mycenaean centres, the local "Ionians" moved from Achaea to Attica while "Dorians" from Argos and Sparta moved into the area. Originally named "Aigialea", the region received its Classical name Achaea after the arrival of the Dorian settlers. Herodotus (1. 145) gives us the names of the twelve main parts, *merea*, or cities in Achaea: Aegae, Aigion, Aegira, Bura, Dyme, Helike, Olenus, Patras, Pellene, Phareae, Rhye, and Tritaeae. These cities (or regions) formed a religious and military alliance known as the First Achaean League, which lasted until the late 4th century BC. Of these cities, several gained particular importance: first Helike, then Aigion, was the meeting place of the Achaean League; and Patras (named after Patreas, chief of the Achaeans) very early on became and remained a vital economic centre.

Achaea did not play a leading political role for most of Archaic and Classical antiquity, but it did play an important part in colonial settlement in south Italy, where Achaeans founded several cities including Sybaris and Croton. Achaea also maintained political ties with other Peloponnesian states and was occasionally considered by these neighbours as a means to increase their own power. Hence, in an effort to strengthen their influence in the Peloponnese, the Spartans transferred the bones of Teisamenos (a pre-Dorian hero and son of

Orestes) to Sparta. Though the Delphic oracle had reportedly ordered the transfer, the move did not ultimately strengthen the ties between the two states.

Achaean involvement in some of the greatest events in Classical Greek history seems to have been limited. Achaeans did not participate in the Persian Wars (at least neither the Spartan nor the Athenian ally lists mention the Achaeans). And while the region became strategically important during the Peloponnesian War, it only occasionally played an active role in it, as in the Athenian and Achaean battle against the Corinthians in the harbour of Patras in 429

BC.

During the 4th and 3rd centuries Greece was politically unsettled and so Achaea's importance grew, since Achaean cities had largely maintained their democratic institutions (only Pellene had ever been ruled by a dictator or tyrant) and maintained strong league alliances. Except for the earthquake that destroyed Helike in 373 BC, the Achaeans experienced relative stability after the Peloponnesian War. Treaties with the Achaean League, therefore, became an important part of the foreign policy of several states. Epaminondas of Thebes (in 366 BC), for instance, led troops into the Peloponnese and entered Achaea hoping to make an alliance and thereby check Arcadia's political strength. He easily won an alliance there, but it did not last because the Thebans unwisely decided to overturn the local governments. Resistance and revolt resulted, causing the Thebans to lose Achaea, and drawing Sparta and Achaea into a short-lived, but close, association. As Macedonian influence grew, the Achaean League responded with policies opposed to Philip II, but with little longterm effect. Philip and his superior troops changed Greek politics for ever. Macedonians would remain dominant in Greece and Achaea until the coming of the Romans. Indeed, even after the death of Philip's son, Alexander the Great, the Antigonids (the dynasty founded by Antigonus I) took control of the region and in 303 BC parts of Achaea were held by Demetrius Poliorcetes (son of Antigonus I).

Twenty years after the Macedonians dissolved the First Achaean League, the Second Achaean League was created (280 BC). The new league was much more inclusive than its earlier version, and by the mid-3rd century it was led by Aratus of Sicyon. Aratus continued the anti-Macedonian tradition – keeping Achaea out of the Roman–Macedonian wars. This course initially benefited league members in their relations with the increasingly powerful Romans. Thus, as a result of these policies, the Romans brought most of the Peloponnese under the control of Achaea. Nevertheless, close Roman–Achaean ties were soon disturbed due to Roman interference in league affairs and their insistence that Sparta be released from the league. The Spartans

had grown opposed to Achaean League power and, when forced to join the confederation, resented league treatment of them. (The Achaeans had torn down the walls of Sparta and disrupted traditional educational practices.) Sparta appealed to the Roman Senate for aid in their conflict with the league. Attempts at arbitration, influenced by a series of misunderstandings, favoured Sparta, resulting in the Achaean war (146 BC), the temporary dissolution of the league, the destruction of Corinth and Patras, and a permanent Roman presence in the region. By 31 BC Octavian made Achaea just another part of the Roman province of Achaea.

There is abundant evidence for vital religious traditions in Achaea throughout its history. Numerous temples, shrines, and sanctuaries dot the landscape. Achaean coins bear the likeness of Poseidon and Athena. In Pellene Pausanias saw a statue to Athena reportedly created by Phidias. He also mentioned an “infallible” oracle for the sick, located at a spring near Patras. The church of St Andrew was later built at the same site, and the waters there were considered to have miraculous powers well into the 19th century. Inhabitants of the region embraced Christianity somewhat earlier than the rest of Greece, in part, perhaps, because St Andrew preached in Patras and was martyred there. Early Christian conversion was accompanied by the urge to build churches, chapels, and monasteries. Not surprisingly, therefore, many early Christian sites can be found in Achaea. One of the region’s oldest intact Christian buildings is the monastery of Makellaria, where an inscription claims that the structure was built by Belisarius (d. 565), general of Justinian I.

Achilles Tatius

Novelist of the 2nd century AD

Achilles Tatius wrote the novel *Cleitophon and Leucippe*, probably in the 2nd century AD. The *Suda* credits him also with works on etymology, on remarkable people, and on astronomy; but the third of these works, entitled *On the Sphere*, may belong to a different Achilles. Photios, Eustathios, and the *Suda* refer to him as an Alexandrian. The report in the *Suda* that he became a Christian bishop is doubtful, and nothing certain is known of his life.

The eight books of his novel set forth the romantic adventures of a young Greek couple, a youth from Tyre and a maiden from Byzantium. The historical setting appears to be the Hellenistic age, but no precise dates are indicated. The narrator of the tale is the hero himself. The tone fluctuates considerably, as passion and drama alternate with wit and farce. The first portion of the novel describes how Cleitophon woos Leucippe while she and her mother are residing as guests in his father's house. To escape the suspicions of Leucippe's mother, the lovers run away and set sail for Alexandria. When a storm destroys the ship, Cleitophon and Leucippe land together on the coast of Egypt and are captured by an army of bandits, who plan to sacrifice Leucippe; but the hero and heroine are soon rescued. They travel to Alexandria and then Pharos, where Leucippe is abducted by a zealous admirer and a gang of brigands, who dupe their pursuers into believing that Leucippe is dead. Several months later Cleitophon reluctantly agrees to marry Melite, a young widow who has fallen deeply in love with him. They journey to her home in Ephesus to be wed, and there Cleitophon discovers that Leucippe is still alive and working as a slave on Melite's estate. Melite's husband Thersander, previously presumed dead, now returns to Ephesus. Incited by the wicked servant Sosthenes, he imprisons Cleitophon on a charge of adultery and develops a passionate lust for Leucippe, but his schemes are eventually foiled. Leucippe and Cleitophon return home to be married.

Like the other ancient Greek novels, Achilles Tatius' work is written in Atticist prose, that is, with vocabulary and syntax imitating those of Athenian prose authors of the 5th and 4th centuries BC. Substantial portions are highly artificial in style, reflecting the literary tastes of the Second Sophistic: for example, strings of two- and three-word phrases often interrupt the regular flow of the prose; adjacent sentences may reflect one another syntactically and rhythmically.

Achilles employs several dramatic and rhetorical elements common

to the Greek novels. In addition to engaging in frequent, often witty dialogue, the characters delight in making speeches. Cleitophon and his friend Clinias debate at length the relative merits of love for boys and love for women (2. 35–38); Melite pleads passionately and eloquently when attempting to seduce Cleitophon (5. 25–26). The artificial language is concentrated in such passages, the argumentation elaborate and sometimes facetious. Achilles also exercises his rhetorical skills in copiously detailed descriptions of events and physical objects: a ship wrecked by a storm (3. 1–4), a hippopotamus (4. 2) and an elephant (4. 4), the city of Alexandria (5. 1). Particularly striking are the several descriptions of works of art, or *ekphraseis* (cf. Philostratus' *Imagines*), the most celebrated of which features a painting of Europa and the bull; situated at the opening of the novel, the lavish visual description of the maiden's abduction announces love and travel as major themes of the ensuing narrative. Other notable rhetorical elements include Achilles' theoretical discourses on the physical mechanisms and psychological effects of emotions and sensations: how kisses give pleasure (2. 8), how rage and anger may vie for control over the soul (6. 19).

Unique among the ancient Greek novels is Achilles' use of a first-person narrator, a technique that offers the reader an intimate and emotionally charged account of events and enhances the characterization of the hero. Like the first-person narrators of the pseudo-Lucianic *Ass* and Apuleius' *Metamorphoses*, Achilles' narrator sometimes appears naive, sentimental, or comic. He occasionally presents himself as an object for mild mockery, as when he is duped into thinking Leucippe dead and pitifully laments her loss (3. 16, 5. 7, and 7. 5), and when he dresses in Melite's clothing to escape Thersander (6. 1–5).

Like his fellow novelists, Achilles attaches considerable importance to the heroine's chastity. Leucippe is instructed by Artemis in a dream to preserve her virginity (4. 1), and in the final book a magical test at the temple of Artemis at Ephesus gives public proof of it (8. 6, 8. 13–14). Achilles' other characters, however, are not subject to the same scrutiny.

Achilles makes liberal use of the mythological and literary tradition. The narrator and other characters, for example, introduce myths as subjects of *ekphraseis* and as exempla in argumentation. Melite playfully likens Cleitophon dressed in women's clothing to Achilles in disguise at the palace of Lycomedes. The characters also quote and allude to a range of authors from the Archaic, Classical, and Hellenistic periods, including Homer, Hesiod, Aristophanes, Plato, Herodotus, Demosthenes, and Theocritus. While portraying the characters as educated and urbane, such references also suggest that

Achilles wrote for a sophisticated reading public.

Several papyrus fragments of the novel attest to its popularity from the 2nd to the 4th centuries AD. Achilles was again read and admired in Byzantine times. Photios and Michael Psellos comment on his faults and his merits. Achilles was a major influence on the 12th-century novelists, particularly on Eustathios Makrembolites, whose *Hysmine and Hysminias* borrows many features of Achilles' plot, including the flight of hero and heroine from home, the shipwreck, and the chastity test. Makrembolites also adopts Achilles' first-person narrative and shows a similar fondness for visual description and the analysis of emotions.

Acragas

City in Sicily

Acragas (Agrigentum in Latin, Girgenti in Italian, then renamed Agrigento after its Latin name by Mussolini; today a provincial capital with about 55,000 inhabitants) was founded four km inland from the southwest coast of Sicily about 582/81 BC by the city of Gela and its Greek mother city Rhodes; the site, steeply rising on three sides, provided a natural fortress. Called “the most beautiful of cities” by Pindar (*Pythian* 12. 1), Acragas' importance already in the 6th century BC is confirmed by the legends about the tyrant Phalaris (560 BC), who

built a fortification and widened the city's sphere of influence. At the beginning of the 5th century BC another tyrant, Theron, seized power and made Acragas the second most important city of Sicily; together with his son-in-law Gelon of Syracuse, he defeated the Carthaginians at the Himera river in 480 BC. The rich booty (including 25,000 prisoners of war) provided the means for an enormous building programme, the impressive remains of which can still be seen in the so-called "Valley of temples".

This term for what is a unique archaeological site is somewhat misleading, as most of the temples are standing on the hilltops along the town wall, so as to be seen clearly from the sea. Similarly, most of the modern names of the temples are not backed up by ancient evidence. The easternmost "Temple of Juno Lacinia" (a peripteros of 6×14 columns) was built in the middle of the 5th century BC; it measures 38.10×16.91 m, which is relatively small in comparison with other Sicilian temples. It was restored several times in the Roman era, but fell into decay afterwards and was rebuilt in 1785, from then on inspiring numerous paintings and engravings (e.g. by Caspar David Friedrich). The "Temple of Concordia" (named after a Roman inscription found nearby but unconnected with the building) was built about 430 BC. It is one of the best-preserved Greek temples anywhere, because in the 6th century AD it was transformed into a Christian church; most of the Christian refurbishments were removed during the restoration of 1785. Like most of the Classical temples in Sicily it is rather small (39.42×16.92 m) and has a peristyle of 6×13 columns. A third temple, dedicated to Heracles (this is confirmed by Cicero's description), lies further west along the town wall. Measuring 67×25 m, it is the largest and earliest Doric peripteral temple at Acragas, constructed at the beginning of the 5th century BC during Theron's reign, on the site of a previous temple, as excavations have shown. Its architecture shows the transition from Archaic to Classical times: the cella has a pronaos, inner sanctuary, and open opisthodomos, and for the first time the closed adytum that was in use in the region before is lacking. According to Cicero the temple contained a bronze cult statue by the Athenian sculptor Myron (5th century BC) and a painting of Heracles killing the snakes by the famous painter Zeuxis of Heraclea (end of the 5th century). North and west from this temple was the site of the ancient city with its agora (only slight traces remain) and the main gate; beyond the city wall are large necropoleis, and at some distance the ruins of a temple of Asclepius (middle of the 5th century BC).

To the west of the city gates lie the impressive ruins of the Temple of Olympian Zeus, a unique example in Greek architectural history. This Olympieion of gigantic size (56.30×113.50 m) was put up by

the Carthaginians taken prisoner in 480 BC (though never finished). Unlike other temples, it had no freestanding peristyle, but closed walls, on the outward side of which there were 7×14 half-columns (about 20 m high), and between them colossal Atlas figures apparently weighed down by the upper part of the temple – an eloquent symbol of the defeat suffered by the Carthaginians. Inside was an immense hall of pillars consisting of three aisles, the middle of which was open to the sky; these peculiar architectural features were taken over from the Phoenician-Carthaginian world and in this way symbolically “imprisoned” within Greek architecture.

To the west of the Olympieion lies the sanctuary of the Chthonian gods, originally of the 6th century, but greatly enlarged during the 5th; it contained several small buildings and numerous altars, the purposes of which are not yet entirely clear. Another two Doric temples were built next to it in the 5th century. Standing in the northwest corner is the so-called “Temple of the Dioscuri”, today one of the landmarks of Acragas. It was heavily restored in the 19th century according to people’s imagination of how it should look and by mixing remains of the 5th-century BC structure with those of its first restoration in Hellenistic times. Next to it is “Temple L”, slightly larger (17.20×38.80 m) and today almost completely destroyed. On the western side of this precinct a large artificial lake (probably constructed under Theron) once formed the water reservoir of the city, but is now a steeply descending valley; beyond are the ruins of the Temple of Hephaestus, the last one built by the city (probably at the end of the 5th century) and unfinished.

After the fall of the tyrants in the early 460s BC, Acragas had a kind of democratic government, in which the city’s most prominent son, the philosopher Empedocles, seems to have played a role. A massive Carthaginian offensive at the instigation of Segesta (from 409 BC onwards) brought an end to Acragas’ might and prosperity; in 406/05 BC the cities of Selinus, Himera, and Acragas fell before this onslaught. In Acragas the revengeful Carthaginians totally destroyed the Temple of Olympian Zeus; furthermore, the city had to demolish its walls and to pay heavy reparations; it never again fully recovered from this blow. In the 4th century BC Timoleon led a new colony to the almost deserted place and Acragas enjoyed a brief revival under the tyranny of Phintias (286–280 BC). In the Punic wars, however, the city again suffered heavily: it was taken successively by the Romans (261) and the Carthaginians (255), and when it fell in 210 BC as the last Carthaginian outpost in Sicily, the whole population was enslaved by the Romans (who soon, however, brought in Sicani as colonists). In the 1st century BC the city regained some importance because of its agricultural production, and accordingly it suffered under Verres’

plundering of Sicily (73–71 BC). In Byzantine times it dwindled to a small village, which after the Arab conquest of 827 grew again and – now being called Kerkent/Gergent – because the centre of the Arab population in Sicily. Today's Agrigento covers only the acropolis of the much larger Greek city.

Acropolis of Athens

The Acropolis is the heart of the ancient city of Athens. It was the focus of habitation from the earliest days of known settlement; its limestone rock, relatively sheer-sided, provided a place of refuge, and it has abundant springs of water round its lower slopes, particularly on the north side. In course of time it became the Late Bronze Age citadel, strengthened with massive fortification walls similar to those at Mycenae and Tiryns, with a palace-type structure within. Sections of the wall survive and are still visible: there is an important stretch at the west end of the rock, while more is concealed behind later walls. The principal entrance was at the west end. It was obliterated at the end of the 6th century BC, and there has been much discussion of the form it took, but it must have had an outer courtyard, edged to the south by a projecting bastion based on the natural rock, and a dog-leg passage through a gateway at the northeast. Of the palace no real traces survive, but it was presumably situated towards the summit of the rock, at its approximate centre. A curiosity is a well, sunk down the side of the rock on the north, within the line of the walls, which gave access to a good water supply even when the Acropolis was under siege. The eventual fate of the citadel at the end of the Late Bronze Age is uncertain. Obviously, it was prepared for attack: the Athenian tradition (which deserves respect) is that the attack on the city was repulsed, and that its history was unbroken.

Certainly the citadel continued to be the focus through the early years of the first millennium BC. Whether it continued as a place of residence for kings is uncertain, but changing circumstances meant that it became rather the chief place of a cult, dedicated to Athena, the protectress of the city (Polias). Her altar was at the summit of the rock, and probably by the end of the 8th century BC a simple temple was situated near to it. The fortification walls remained, and the rock was still defensible, the entrance being as yet unchanged from its Mycenaean form. A curious survival is found at the well. This had partly collapsed and was filled in after only a short period of use, but the opening and the first few steps down remained, and were used for an annual ritual in which young girls chosen as priestesses descended as far as they could with mysterious bundles that they deposited at the bottom, perhaps an unconscious reenactment of collecting water when the well had functioned.

Development of the site was centred on the provision of improved structures for the cult of Athena. The temple in front of the altar (generally referred to as the "Old Temple") was steadily improved. A substantial foundation wall for its north side was constructed in the 7th century BC, and is still visible. Eventually, perhaps at the end of the 7th or in the 6th century BC (the date is disputed), the temple became peripteral. It had a complex cella, double ended, the main room facing east to the altar, the west divided into two chambers side by side and with an antechamber. The whole building was surrounded by an outer Doric colonnade, behind which at each end inner rows of four columns stood in front of the porches (prostyle porches). The temple was decorated with sculpture, great pediment groups of heraldic felines, which were removed during later repairs and buried on the Acropolis, where they were found in the 19th century. They are now in the Acropolis Museum. The final rebuilding came towards the end of the 6th century BC, at the end of the period in which Pisistratus, and afterwards his son Hippias, ruled Athens as autocrats (tyrants in the Greek sense), and supposedly had a palace on the Acropolis. In its final form the temple was given a new external limestone colonnade, with metope panels of Parian marble, and new Parian marble pediment groups in the latest style, a battle of gods and giants, which included a striding Athena killing a giant, much of which survives in the museum. This temple contained the venerable and original cult statue, which was a simple image carved from olive wood. For it, the maiden priestesses of Athena wove, once every four years, a new dress or *peplos*, which was brought to the statue in a sacred procession. By the 6th century BC this procession of the Panathenaic Festival, held once a year, with a particularly important one for the bringing of the *peplos* every fourth year, was the main event in Athens' religious

calendar, and resulted in a gathering of the majority of the citizens.

Less clear are the other structures on the Acropolis at this time. There is evidence for another large temple to the south of the Old Temple, which by the end of the 6th century BC seems also to have had marble metopes; and fragments of the super-structure of several small buildings, often highly decorated, for which no foundations survive. What is certain, though, is that the religious usages, the shrines, and the sacred spots on the Acropolis rock established during the early centuries of the first millennium BC formed the basis of its continuing function throughout the Classical period.

Improvements began to be made at the end of the 6th and early in the 5th century BC. The Acropolis was last defended, in a minor skirmish, by the Spartan king Cleomenes I in an abortive intervention following the downfall of the tyrants; but it was then essentially demilitarized, the city being defended, presumably, by an outer circuit of walls. The old Mycenaean gateway was therefore torn down, though the fore-court, presumably an important point in the passage of the procession on to the rock, was retained. A new marble gateway with a colonnaded façade was eventually constructed. More importantly, after the victory of Marathon in 490 BC, the southern temple was pulled down and work started on a new, large, and magnificent Doric temple, in marble quarried on Mount Pentelicus, for which the first requirement was deep foundations, 20 courses of limestone, along its south side so that it could be extended in that direction. This work must have caused severe damage to the Mycenaean walls, which were here in a state of collapse.

The work stopped abruptly in the late 480s BC, when the threat of a new Persian invasion probably meant that all available funds were diverted to the building of warships. Athens was abandoned to the invader. The wooden cult statue, together with the women and children, was evacuated, and the walls of the Acropolis hastily patched up and a forlorn defence mounted, not perhaps in opposition to the policy of evacuation and naval defence but because the Athenians felt an obligation to defend the goddess's property. The Acropolis fell and was sacked. The innumerable statues set up as offerings to Athena (many on behalf of the priestesses when their period of office ended) were vandalized, and the partly built new temple, in its scaffolding, and hardly risen above platform level, was burned. The centre of resistance was probably at the gateway building, which would have been fiercely defended. This was severely damaged. The Old Temple was also burned.

When the Persians were driven out, the Athenians returned to tidy up the Acropolis, but not, as yet, to rebuild. The broken statues were gathered up, and, as the property of Athena, buried on the rock itself.

The damaged outer colonnade of the Old Temple was dismantled, and part of its entablature built into new walls surrounding the Acropolis, near where the temple stood, on the north side, presumably as a war memorial. It is still visible there. The gateway building was repaired, using secondhand material. Some sort of simple shrine was built at the side of the Old Temple to house the wooden statue, returned from evacuation. The west cella of the Old Temple was patched, to serve perhaps as a repository for sacred objects rather than as a temple. And nothing else: either the resources of Athens were devoted rather to the prosecution of the continuing war against Persia, or the Athenians felt bound by an oath sworn by their army before the battle of Plataea, not to rebuild the vandalized buildings but to leave them in a ruined state as a memorial to the barbarians' sacrilege.

The revival finally got underway in 451 BC. Athens's prestige as a leader of the Greek world demanded splendid buildings on the Acropolis. Control of what was now in effect an empire provided funds, and the war against the Persians had reached some form of satisfactory conclusion. The rebuilding is essentially associated with Athens's greatest politician, Pericles, though he did not live to see it completed. Work began with the south temple, known as the Parthenon, the temple to Athena the virgin goddess (though her cult title was still *Protectress of the City*). Material left undamaged from the unfinished predecessor was used, including the massive south foundation, but the temple was slightly larger and certainly more magnificent, with eight rather than six columns forming its façade. It was built of Pentelic marble; the architects are named as Callicrates and Ictinus. The lavish sculptural decoration was designed by Phidias, though a whole gang of craftsmen would have been employed to execute the work. All the metopes are carved, and a tremendous continuous frieze ran across the inner porches and over the side walls of the cella. The pediments depicted the contest of Athena and Poseidon for the patronage of Athens, and the birth of Athena. The cult statue was a masterpiece in gold and ivory. The whole was completed in 436 BC.

The second building to be replaced was the gateway, the Propylaea, elaborated to include not only the gateway itself, with Doric porches, but also adjacent rooms, one, at least, to the northwest side being used for ritual feasting and decorated with paintings. Work started in 436 BC, to the design of Mnesicles, but, with war against Sparta looming, the plan was truncated, the inner rooms being abandoned. The structure was brought to a hurried completion just before the war broke out, in 431 BC. The abandoned rooms were never built, though indications of their position can still be seen.

Other building was resumed in the years of peace that began in 421

BC. A small temple of Victory (Nike) in the Ionic order was constructed on the bastion of the entrance. Shortly after, the replacement for the Old Temple was started on a new site to the north: the remains of the Old Temple were eventually removed, leaving only the foundations, which are still visible. The new building (popularly called the Erechtheum, after the legendary king Erechtheus, but more officially "The Temple in which is the Old Image") is built to a most unconventional plan. It has a rectangular cella, on two levels, higher at the east, lower at the west, with an internal arrangement recalling the Old Temple. The eastern room housed the cult statue, and had a façade of six Ionic columns. There is another Ionic porch at the west end of the north side, Ionic columns on the west end (but with bases at the higher, eastern floor level), and on the south, a small projecting porch whose roof and entablature rest on the heads of six incongruous draped female statues, recalling the earlier statues of the priestesses, which were now buried nearby. This building is more than a temple, rather a decorative embellishment to a number of sacred spots and shrines. It gives access, through a subsidiary door in the north porch, to the shrine of Pandrosos and the sacred olive tree, the gift of Athena herself when she contested the patronage with Poseidon. In the north porch is Poseidon's effort, a pool of salt water, which appeared when he struck the Acropolis with his trident. Building the Erechtheum dragged on. Completion was delayed by a fire, and it was finished only in 406 BC, just before the Athenians were finally defeated by the Spartans.

After that, Athens no longer had the money for lavish buildings. Statues and other offerings were dedicated in abundance over the years, one of the earliest and certainly the largest being the colossal bronze statue of Athena the Champion by Phidias, which stood between the Propylaea and the temples. In the years after the death of Alexander the Great in 323 BC the successor king Demetrius Poliorcetes took up residence on the Acropolis as befitted a king (the stories of his orgies with prostitutes there may well be a calumny). In the 1st century BC the Erechtheum was again damaged by fire, but was carefully repaired, the new workmanship being of the same high standard as the original. The same craftsmen were employed, to judge from the details of the work, to build a small circular shrine dedicated to Rome and Augustus, placed in front of the Parthenon. After that little changed, though the Parthenon was severely damaged by fire in the 4th century AD and needed repair. The Acropolis had become a classic monument to Athens's days of glory; its fame, and the reputation of its buildings, was universal, even when other places were built more lavishly, and on a larger scale.

Adoption

The major preoccupation of modern legislation on adoption is the welfare of the adopted child. In ancient Greek cities adoption was used mainly as a succession strategy for childless people. It also entailed duties of a religious character for the adopted person. Adoption has always had a public dimension, expressed either with a declaration in the marketplace or in a civic ceremony or, as in Hellenistic Egypt and Byzantium, with the written instrument or, as happens today, with a court decree.

The laws of Gortyn regulate in detail the process of adoption (called *anpansis*). Only male adults had the right to adopt. The adoption took place in public, in the agora. The declaration was followed by a ceremony in the political association (*hetaireia*) of the adopter and a sacrifice. The existence of natural children was not an impediment to adopting other children. Legal implications related mainly to inheritance. In particular, if the adopter died without natural heirs, then the adopted inherited his property as well as the obligation to perform religious rites. If the adopter had natural sons (or daughters), then the adopted received a portion equal to that of the natural heiresses. If the adopted died without natural children, the property he inherited was transferred to the next of kin (*epiballontes*) of the adopter. The adoption was cancelled in public and the adopter had to pay 10 staters to the judge, who in his turn gave this amount to the adopted.

In Athens adoption (*(eis)poiesis*) was geared towards the establishment of an heir to the adopter's property and the continuation of his *oikos* (family). Adoptions could be performed in one of three ways: during the lifetime of the adopter (*inter vivos*), by will (testamentary), and posthumously. Only men could adopt, and it was more likely that adult men rather than boys would be adopted. The adopted was able to inherit the property of the adopter like a natural son, without any previous legal formalities. Testamentary adoption was introduced by Solon at the beginning of the 6th century BC. It allowed a man without sons to adopt by testament an adult male,

who would inherit from him. If there was a natural daughter, the adopted son would either marry her himself or provide her with a dowry equal to half of the paternal property. Elderly people were safeguarded from being manipulated by a law annulling an adoption if the adopter was very old or suffered from a mental or physical illness or was under the influence of drugs or was threatened. Finally and most curiously, a posthumous adoption could be performed by the family in the context of a mutually acceptable settlement.

As for other Greek cities we know that in Sparta an adoption took place in front of the kings while in Thebes there was a connection between adoption and grants of land. Adoptions are attested in a large number of inscriptions, especially from Rhodes.

Adultery

Hellenic culture has exhibited an almost obsessive concern with female chastity since the time of Homer; Helen's elopement with Paris led to the Trojan War, while Aegisthus' seduction of Clytemnestra destroyed her husband and endangered his house. One key to this concern is the legitimacy of children; a man can never be absolutely sure of his own paternity and that of his children, and even Telemachus, son of the super-chaste Penelope, admits that it is a wise child who knows his own father (*Odyssey*, 1. 215–16). Equally important is the impact of female unchastity on social relationships between men. These relationships are informed by concepts of honour, shame, and public reputation, ideas crucial to an understanding of the sexual mores not only of Greek antiquity but also of modern Hellenic society.

With regard to adultery (*moicheia*) in ancient Greece, it was the

married or marriageable status of the woman involved that was the crucial point, not the status of the man. *Moicheia* comprised sex between any man, for whom marital status was irrelevant and marital fidelity unnecessary, and a female under a male citizen's protection (that is, the wife, daughter, sister, or mother of a citizen); for a man, married or unmarried, sex with a slave or a prostitute, male or female, did not constitute adultery.

Concerns about adultery in antiquity were informed by particular political and inheritance systems. In Classical Athens, where the male line was a critical factor in the transmission of property and citizen status, the avoidance of adulterine bastardy was accorded a corresponding importance; where patrilineal inheritance pertains, all property depends upon the chastity of women.

Extreme penalties were attached to adultery in Athens. A Draconian law of 621 BC allowed the summary execution of an adulterer caught in flagrante, while Plutarch attributes to Solon a law that allowed a father to sell into slavery an unmarried daughter caught with her seducer (*Solon*, 23. 2.), an unparalleled treatment of a free person in Attic law and an indication that the ruined girl no longer had any civic status to violate. These uncompromising penalties had fallen into disuse by the Classical period, but still adultery was criminalized as an act of hubris (disrespect, outrage) against both the individual (that is, the citizen in charge of the ruined woman) and the community. Adultery was regarded as an anti-democratic offence, an act of political as well as sexual subversion, and, accordingly, the social and legal consequences could be severe. Adultery could be used as a justification for homicide if the adulterer (*moichos*) was caught in the act, but the penalty attaching to the charge of adultery (*graphe moicheias*) was more usually a fine or public humiliation. However, there is no firm extant example of the use of the *graphe moicheias* and a prosecution for hubris (*graphe hubreos*) may have been preferred. There was no legal procedure available against the woman taken in adultery, but her punishment was severe also; she was compulsorily divorced and prohibited from participating in public sacrifice ([Demosthenes], 59. 87; Aeschines, 1. 183–84). However, the shame attaching to the cuckold and the compulsion to return both wife and dowry may have induced some husbands to keep the matter quiet and out of the public arena (Euripides, *Hippolytus*, 462–63; Aeschines, 1. 107), and there is evidence to suggest that others manipulated the situation to extort money from adulterers ([Demosthenes], 59. 64–70).

Despite the potential consequences, adultery provided an opportunity for erotic and romantic attachments in a society where arranged marriages were the norm. Many may have thought it a risk worth taking, and several texts imply such behaviour may not have

been uncommon (for example, Aristotle claims that it is easy to commit adultery with the wife of a friend or neighbour: *Ethica Nichomachea*, 1137a5). Nevertheless, adultery was regarded as such a severe dereliction of social and civic duty that it could be described as a crime worse than rape (Lysias, 1. 32–33), perhaps because seduction involves the desire and complicity of the woman, and her deception may extend to passing off a lover's children as a husband's. Thus the adulterer and his offspring could take over the household and its legitimate line of descent.

For democratic Athens the civic consequences of adultery were incorporated in the political notion of hubris, but the personal and social dishonour that attaches to the man who cannot guard the women of his household or avenge their disgrace is a transhistorical concept for Hellenic culture which has persisted into 20th-century Greek society. A man's honour (*time*, a term used in both ancient and modern Greek), that is to say, the social recognition of his worth, is defined largely through the chastity of his women. If the chastity of a man's mother is compromised, his own legitimacy is at stake; if his wife is suspected of adultery, the implication is that his children may be bastards, while the idea that a man is not man enough to control his women is a slur on his masculinity (*andrismos*, a modern Greek term). Conversely, the adulterer, while condemned as socially disruptive and a threat to family stability, may enhance his reputation for virility through his behaviour. The cuckold, however, is a shamed, emasculated, and stigma-tized figure. Women are expected to safeguard their own and their families' reputations by cultivating the appearance of sexual modesty (*dropi*, again a modern Greek term). In the 5th century BC Pericles proclaimed that a woman's greatest glory was not to be talked about (Thucydides, 2.45), and the public demonstration of female chastity is crucial still – women must not only be chaste, they must be seen to be chaste. Social reputation and gossip are particularly significant in face-to-face societies, not only in those of the ancient world such as Athens but in any close-knit Hellenic community in or outside Greece, and perhaps especially important in village life.

These common social attitudes towards adultery are supported by the Church's attempts to regulate sexual behaviour. Adultery has been marked out for especial censure throughout the Christian tradition, which condemns fornication, a notion that embraces any extramarital sex, either premarital or adulterous, and which threatens the Christian ideal of the "pure" marriage. Indeed, later canon law prescribed death for the adulterer, the strong proscription being based on Matthew 5: 32, which proclaimed that "whoever looks at a woman to lust after her commits adultery with her already in his heart", a pertinent

illustration of the Christian principle that sexual fidelity is expected of husbands as well as wives, a marked contrast to the ancient world. However, it is the adultery of wives, not husbands, that provides the only valid grounds for divorce in the Orthodox Church, at least technically, referring to the authority of Matthew 19: 9, which states that if a man remarries, having divorced his wife for any cause other than adultery, he himself commits adultery. For Christian Greeks in particular the marital status of men as well as women is relevant to the definition of adultery, but from antiquity to the present, in both social and religious terms, the unchastity of wives has been the greater concern.

Aegae

City in Macedonia

The Macedonian city of Aegae (more properly Aegeae) is situated in the northern foothills of the mountain range of Olympus, by the modern village of Vergina, overlooking the river Haliacmon and what is now a rich extent of flat cultivated plain but in antiquity was more likely, at best, marshland. The ancient road to northern Greece, followed by an Athenian army in 432 BC, ran from the coastal towns of Pydna and Methone westwards past Aegae before turning north at the next locality, Beroea. This area formed the Macedonian heartland, and from it successive Macedonian kings extended their rule west and north, until by the 5th century BC the whole region round and beyond the Axios (which flows down from the central Balkans) was part of the Macedonian state.

The city itself is still largely unexcavated. Traces of its fortifications and a city gate, enclosing an acropolis-type hill, can be made out, but archaeological work has concentrated on the areas below this, where important discoveries have been made. The existence of important remains was first noticed by the French archaeologists L. Heuzey and H. Daumet in the 1860s, though they did not identify the site as the ancient Aegae. Following an ambiguous passage in the Roman historian Justinus (7. 1. 7) it was believed that Aegae was situated at Edessa, where there were also ancient remains; but in an important paper given at the First International Symposium on Ancient Macedonia in 1967 N.G.L. Hammond pointed out that this was a misinterpretation, and that Aegae was located elsewhere: because of its archaeological remains, and other literary evidence, particularly Theophrastus, *De Ventis*, 27, he suggested Vergina. Subsequent discoveries there have more than confirmed this.

Outside the town, on the flat ground, is an extensive cemetery of pit graves covered with low tumuli dating from the early Iron Age (the turn of the 2nd and 1st millennia BC) into the Classical period. The contents of the earlier tombs show connections with regions further to the north, and they are therefore to be identified as the graves of the original Macedonian settlers. There is no good archaeological evidence for the adjacent settlement at this time, and it hardly merits being called a city. Its importance is demonstrated rather by the large

number of graves. Aegae is thus the traditional Macedonian centre, and remained so, particularly in terms of its religious function, even when a new city was created at Pella. It should have been a place of residence for the Macedonian kings, but although the 5th-century king Perdiccas was encountered there by the Athenian army in 432 BC, there is no trace of an actual royal residence until the end of the 4th century BC when a substantial palace was built, measuring overall 104.5 by 88.5 m. This consists of a central courtyard 44.5 m square with a peristyle of 16 Doric columns on each side. To the east and north are open verandahs (a most unusual feature for Greek residences, which are invariably closed and inward looking) commanding extensive views over the Haliacmon. Most of its rooms are equipped as formal dining rooms, appropriately graded to accommodate the different ranks of the Macedonian court; the palace seems to have been designed primarily for ceremonial or religious functions rather than as a conventional administrative building.

Below the palace is the theatre, which had wooden seats arranged on the earth slopes, apart from the first row which was limestone. It was here that the great Philip II was murdered in 336 BC, watching a procession in celebration of the marriage of his daughter Cleopatra. Nearby is a small temple, dedicated to the goddess Eucleia by Philip's mother Eurydice. But the most convincing evidence that Vergina is the ancient Aegae is the Great Tumulus, excavated by Manolis Andronikos. Aegae was known from literature (Plutarch, *Pyrrhus*, 26. 6–7) to have been the burial place of the Macedonian kings. Hammond suggested that a built vaulted tomb, of the type categorized as Macedonian and excavated by K. Rhomaios in the 1930s, decorated in the same form of the Ionic order as the monument of Philip at Olympia, might be where he was buried after his assassination. Andronikos's excavation of the largest of the tumuli uncovered more "Macedonian" tombs, including one that was unrobbed, containing the remains of the cremated dead (a man and a woman) in chests of gold together with a vast array of other objects, gold, silver, ivory, and an iron breastplate similar to that worn by Philip's son Alexander in the mosaic which depicts him at the battle of Issus. The remains of the dead man were not completely reduced to ashes, and enough of the bone structure remained to indicate that he was of Philip's age when he died, and that, like Philip, he had been blinded in one eye by an arrow which had entered the skull from above; in all there is ample evidence to confirm the identity of the great Macedonian king and the locality at Vergina as the city of Aegae.

The subsequent history of Aegae is uncertain, and there is no secure archaeological evidence later than the Hellenistic palace. During the troubled years which followed the death in 297 BC of king Cassander

(who may have been responsible for the palace) the royal tombs were plundered by Gallic mercenary soldiers employed by the king of Epirus, Pyrrhus, during his invasion of Macedonia in 288 BC. Somehow, Philip's tomb escaped, and it was after this that Antigonos Gonatas, when he secured the kingship of Macedon for himself in 277/76 BC, heaped over it and another un plundered royal tomb the great mound which preserved it intact.

After the final Roman conquest of Macedon following the battle of Pydna in 167 BC, Aegae disappears from history. It is not one of the capitals of the four separate regions into which the Romans divided the former kingdom. Too closely associated with the traditions of the Macedonian people and monarchy, it had no place in the Roman system of things. If not deliberately destroyed, it was defortified and, probably, allowed to dwindle away, its place as the leading city of this area being taken over by Beroea.

Aegina

Island in the Saronic gulf

The island of Aegina lies centrally in the Saronic gulf, some 20 km southwest of Piraeus and the same distance from the Argolid peninsula; it has an area of 83 sq km. The location of the island so close to Attica resulted in a greater involvement with the events and developments of mainland Greece throughout its history than any other island of the Aegean. It has always benefited from a fine natural harbour on the west coast, beside which the town of Aegina grew up and flourished. Its climate is more sheltered than most of the Aegean islands, and its land produces major crops of pistachio nuts as well as olive oil, grapes, almonds, and figs.

Colonized in the 3rd millennium BC, by the 2nd millennium BC Aegina had already become an important trading post. During the 10th century BC (according to Herodotus) the island was colonized by Dorians from Epidaurus, having previously undergone Mycenaean occupation; since then it has played at various points an active, and

sometimes vital, part in Greek history. The Aeginetan navy was a force of paramount importance from the 7th to the 5th centuries BC, and played a major role in the defeat of the Persians at Salamis (480 BC). Also flourishing during these centuries were the skills of its potters and bronze-founders, and modern products of the former are still sold widely today. But the outstanding survival from this period is the temple dedicated to Aphaea, built in the late 6th or early 5th century BC on a hill in the northeast of the island and looking out over the Saronic gulf towards Attica. Although considerably damaged, it still retains 24 of its 32 original columns, and of particular interest are surviving traces of pigmentation on the floors of the pronaos and cella; originally the columns, of local limestone, were stuccoed and then coloured. Figures from the pediments, carved in Parian marble by the famous Aeginetan sculptor Onatas, were taken to Munich after their discovery in 1811. The individuality of Onatas' artistic style is suggested by the comment of Pausanias (5. 25) that his figures, "even though they are in the Aeginetan style, I would not assess as inferior to those of the Attic school of sculptors". Another sculptor from Aegina called Smilis, the son of Euclides must have been one of the more famous sculptors of his day, since the cult image of Hera in the huge temple on Samos was, according to Pausanias, made by him (7. 4). Later, the inhabitants of Aegina were expelled at the start of the Peloponnesian War, but were able to return by 400 BC. For the rest of the pre-Christian period the history of the island was closely linked to that of Athens.

Aeolians

Ancient ethnic group

Of all the major ethnic groups of ancient Greece the Aeolians are the most indistinct. In modern scholarship the term is generally applied to the populations of Thessaly, Boeotia, the eastern Aegean islands of Lesbos and Tenedos, and the northwestern littoral of Asia Minor north of the Hermus valley – largely on the basis of the structural similarities between the dialects of these areas (although the Boeotian dialect displays several "Northwest Greek" characteristics while the

Aeolic dialects of the eastern Aegean are marked by “Ionicizing” features almost certainly due to regular contact with neighbouring Ionian settlements).

In antiquity, however, the term “Aeolians” was applied more indiscriminately. The 1st-century BC geographer Strabo (8. 1. 2) says not only that all the populations north of the Corinthian isthmus (with the exception of the Athenians, Megarians, and Dorians “around Parnassus”) were Aeolian, but that the Dorians of northern Greece were themselves originally Aeolians whose speech and customs eventually became distinct as a result of their isolation from their neighbours. He claims further that Aeolians had inhabited the Peloponnese prior to the arrival of the Dorians but that most had assimilated with the Dorian invaders save for the Achaeans, the Eleans, and the Arcadians. It should nevertheless be noted that the West Greek dialects of Achaea and Elis and the Arcado-Cypriot dialect of Arcadia appear to demonstrate little or no similarity with the Aeolic dialect group. The lack of coincidence between claims of ethnic origin and the linguistic situation marks a striking contrast with the case of the Ionians and Dorians, and it has been suggested that the etymology of the term “Aeolians” indicates a group of mixed origins.

According to tradition, Thessaly had originally been called Aeolis (Herodotus, 7. 176. 4), though the 5th-century BC historian Thucydides (3. 102. 5) believed that ancient Aeolis was the area surrounding the Aetolian towns of Calydon and Pleuron. Sixty years after the Trojan War, the Aeolian Boeoti who had formerly been settling Thessaly were expelled and occupied Boeotia to the south (Thucydides, 1. 12. 3; Pausanias, 10. 8. 4). Immediately after settling Boeotia, some of the Boeoti accompanied Penthilus, son of Orestes, in his expedition to colonize the island of Lesbos and Aeolis in Asia Minor (Thucydides, 7. 57. 5; Strabo, 9. 2. 5). There were, however, variant versions – the 2nd-century AD traveller Pausanias (3. 2. 1) says that Penthilus colonized Lesbos and his grandson Gras settled Aeolis, but Strabo (13. 1. 3) reports that it was Gras who settled Lesbos, while the city of Cyme on the coast of Asia Minor was founded by two other descendants of Agamemnon, Kleues and Malaus – and it is generally believed that the tradition of the Aeolian migration was a relatively late compilation that is unlikely to predate the 5th century BC. In particular, the idea that the Aeolian Boeotians were led by the ethnically unrelated Penthilus parallels the tradition of the Dorians returning to the Peloponnese under the leadership of the descendants of Hera-cles and was almost certainly coined to justify the claims of the Penthilidai, the ruling family in the Lesbian city of Mytilene (Aristotle, *Politics*, 5. 10).

In fact, it is more than likely that a sense of Aeolian identity first

emerged among the cities that were founded in the eastern Aegean c. 1000 BC. At the beginning of the 7th century BC Hesiod (*Works and Days*, 636) described how his father had left “Aeolian Cyme” for Boeotia; a century later the poetess Sappho evokes “the Muse in Aeolian Eresus” (a city on Lesbos), while a tribe named “Aeolis” is attested in the Lesbian city of Methymna. It is telling that the only Aeolian city which participated in the foundation of the 6th-century Hellenion sanctuary at Naucratis was the Lesbian city of Mytilene (Herodotus, 2. 178. 2.). The principal vehicle for the expression of this identity was without doubt the league of 12 cities in Asia Minor which is described in the 5th century BC by Herodotus (1. 149) and which was originally thought to include Smyrna, Cyme, Larissa, Neon Teichos, Temnos, Cilla, Notion, Aegiroessa, Pitane, Aegaeae, Myrina, and Gryneia. Herodotus goes on to report how Smyrna was captured by the Colophonians and transferred to the Ionian Dodecapolis. It has been suggested that the league should predate the 8th century BC since from this time the archaeological evidence at Old Smyrna appears to display no qualitative differences from other Ionian settlements. On the other hand, there is no evidence that ethnic affiliations in ancient Greece were necessarily expressed through distinctive repertoires of material culture, and it is far more likely that the league emerged in the course of the archaic period (possibly the early 6th century) as a direct response to the foundation of the Ionian Dodecapolis. On the basis of perceived ties with central Greece (perhaps historical as well as invented), a sense of Aeolian affiliation may have spread from the eastern Aegean to the regions of Boeotia and Thessaly.

Towards the end of the 6th century BC the compiler of the pseudo-Hesiodic *Catalogue of Women* attempted to systematize and harmonize the variant genealogical traditions of different Greek cities so as to anchor local mythologies within a broader panhellenic context. Besides accounting for relationships between various local heroes, the *Catalogue* articulated in genealogical form the relationship between various Greek ethnic groups by deriving filiation of their eponymous ancestors (Aeolus, Dorus, Ion, Achaeus) from the original ancestor of the Greeks, Hellen (Hesiod, fr. 9, 10a). But whereas Dorus, Ion, and Achaeus are relatively faceless figures whose only function would appear to be to express relationships between Greek population groups, Aeolus stands at the head of a developed genealogical tradition that includes a host of heroes from various localities throughout Greece. It is highly likely that the Aeolus who acts as the ethnic eponym for the Aeolians has here been assimilated with an older homonymous figure and that Strabo’s extensive application of the term “Aeolians” stems from the widespread distribution of local heroes belonging to this Aeolid lineage.

From the end of the 5th century ^{BC} Aeolian identity ceases to operate in any meaningful way. It is possible that it was its indiscriminate application that militated against any solid criteria for collective consciousness, but the political situation on both sides of the Aegean sea also played a role. In the east the Aeolian cities – like their Ionian neighbours – succumbed to the successive domination of Lydia, Persia, the Athenian empire, Persia again, the Seleucids, the Attalids, and finally Rome, though even prior to their incorporation within the Lydian empire they had, with the exception of the cities on Lesbos and Tenedos, accepted the leadership of the Ionians (Herodotus, 1. 151. 3). On the Greek mainland, Thessaly became increasingly riven by internal disputes while the Boeotian city of Thebes concentrated on promoting a pan-Boeotian federation over which it claimed hegemony; but any sentiment of ethnic affinity between the two regions was counteracted by their siding with opposing alliances during the Peloponnesian War and by the construction of an ethnicizing rhetoric between Dorians and Ionians in which the Aeolians found no voice.

Aeschines c.390–c.322 ^{BC}

Orator

Aeschines came from an Athenian family that was impoverished by the Peloponnesian War. He was forced to earn a living, and his various early occupations included working as the secretary to the assembly and as a tragic actor. These, and military service for which he was decorated, would stand him in good stead in his political career, which took off after the destruction of Olynthus by Philip II of Macedon in 348 ^{BC}. Aeschines was sent to Arcadia as an ambassador to

promote Eubulus' proposed Greek congress, which would discuss resistance to Philip, but in the event in 346 BC he was one of the negotiators of the short-lived Peace of Philocrates. One of his fellow ambassadors was the staunchly anti-Macedonian Demosthenes, and the two men, who had fallen out when serving on the council in 347/46 BC, became sworn enemies. Aeschines may have been duped by Philip, who appeared friendly towards Athens, but Demosthenes accused him of accepting bribes. Demosthenes soon received more ammunition for this charge, as Philip invaded Phocis; Aeschines was sent to plead for fair treatment of the defeated Phocians, and Philip held a feast attended by Aeschines and his fellow envoys. On Aeschines' return to Athens Demosthenes began proceedings against him for treason (346/45 BC), but acted through the notorious rake Timarchus. Aeschines successfully countered with his *Against Timarchus*, in which he prosecuted Timarchus for addressing the assembly when forbidden to do so because of his immorality, and it was not until 343 BC that the mood in Athens was right for Demosthenes to bring the case himself. Aeschines delivered his *On the False Embassy* speech and was narrowly acquitted, but his credibility was undermined. Nevertheless, in 339 BC he was sent as an Athenian representative to the Amphictonic Council at Delphi; but at a time when Greek unity against the threat of Philip was essential, Aeschines managed to stir up a Sacred War against Amphissa. As a result Philip had the excuse he needed to intervene in central Greece, and Athens and Thebes were compelled to oppose him at the disastrous battle of Chaeronea. With his background of friendly relations with Philip and hostility towards Demosthenes, Aeschines was sent on the embassy to negotiate peace terms, after which he largely withdrew from the political arena.

Two opportunities subsequently presented themselves for Aeschines to return to the limelight and attack Demosthenes. In 336 BC Ctesiphon proposed that Demosthenes should be crowned for his services to Athens in the theatre at the Great Dionysia, and this gave Aeschines the chance to prosecute Ctesiphon for making an illegal proposal. Philip's murder, however, meant that the trial was delayed, and it was not until 330 BC, after the failure of Agis III's revolt and with Athens firmly under Macedonian control, that the second occasion presented itself. Aeschines delivered his *Against Ctesiphon*, in which he raised probably valid technical reasons for the illegality of Ctesiphon's proposal, but also attempted to show that Demosthenes' career made him unworthy of such an honour. Demosthenes replied with his superlative *On the Crown* speech, and Aeschines failed to secure one-fifth of the votes. He was thus fined heavily, but it was his humiliation that led him to retire to Rhodes, where he probably spent the rest of

his life teaching rhetoric and giving public declamations.

Aeschines was not a professional speech writer, and there is no firm evidence that he studied rhetoric, even if he did become a teacher. His speeches are primarily important for their subject matter, but as with his political career, estimation of Aeschines' literary merits has suffered unduly in ancient and modern times by comparison with Demosthenes. Aeschines writes clear, vivid narrative, sometimes with lengthy sentences but regularly in shorter periods, and with an avoidance of hiatus that is evidence for careful composition. He employs ordinary Attic vocabulary, interspersed with poetic and rare words; and his actor's training leads him to frequent quotations of poetry, which are often long and largely irrelevant. He is prone to using exaggerated language (one of his favourite words is *deinos*, "terrible"), with accumulations of synonyms and appeals to the gods, and he has a range of vivid metaphors at his disposal. Aeschines has an innate wit, which is particularly noticeable when he is attacking Demosthenes, and these attacks can, in the fashion of the time, become extremely abusive. But generally Aeschines' Greek has a dignified tone, as befits a dignified man who deplored the use of extravagant gestures while speaking.

Only the three speeches mentioned above survive, and this was the case also in the Roman period, when Caecilius of Caleacte pronounced a fourth speech concerning Delos spurious. All three are forensic, though delivered in connection with wider public issues. Aeschines, however, tends to avoid these issues and to concentrate on the legalities of the case, but at the same time his talent lies in narrative rather than argument. Hence in *On the Embassy*, Aeschines' best speech, he does not attempt to explain his policies, but offers an amusing and lucid narrative of Demosthenes' totally losing his nerve in the presence of Philip on the first embassy sent to discuss the Peace of Philocrates. When it came to *Against Ctesiphon* Aeschines could not avoid discussing the wider issues, but he concentrates on the results of Demosthenes' policy, not the policy itself. Demosthenes' response was to emphasize the patriotism that underlay his opposition to Philip, and Aeschines later could not help but admire the speech that ruined him.

If Demosthenes' victory in the *Crown* trial undermined Aeschines' subsequent political and literary reputation, some of his merits were, nevertheless, praised by the ancient literary critics, in particular his powerful voice and delivery. The activities of his last years in Rhodes were recognized in the 3rd century AD by the sophist Philostratus of Lemnos, who included Aeschines in his *Lives of the Sophists* and credited him with being the first in a new generation of declamatory sophists, the founder of the so-called "Second Sophistic", which flourished in the 1st and 2nd centuries AD. Aeschines, like other

members of the canon of ten Attic orators that had been firmly established by the 2nd century AD, served as a model of Classical Attic oratory, and the sophistic tradition continued in the schools of rhetoric through late antiquity and the Byzantine period down to the Renaissance. The speeches of the *Crown* trial continued to be the focus of attention, and if this was to the greater glory of Demosthenes, it helped to keep Aeschines in the forefront of study. The sophist Himerius, who taught rhetoric in Constantinople (AD 343–52) and Athens (AD 352–61), wrote a speech in the person of Demosthenes against Aeschines; George Chrysokokkes, the Byzantine schoolmaster, copied the manuscripts of Aeschines in the period 1420–28 for his Italian patron Aurispa; and the Cretan Demetrios Doukas assisted in the preparation of the first printed edition of Aldus Manutius in 1513. One final indicator of the continuing study of Aeschines is the collection of scholia to Demosthenes and Aeschines in the monastery of St John on Patmos.

Aeschylus c.525–456_{BC}

Tragedian

Aeschylus saw Athens victorious over the Persians in 490 BC and again in 480–479 BC. His tomb at Gela tells us that he fought at Marathon, but nothing about his drama. Supposedly he came from a distinguished family. He was invited by Hieron I to visit Syracuse in Sicily, and he wrote his *Women of Aetna* on the occasion of Hieron's founding of the city of Aetna. His plays were esteemed for their inspirational and educational value. In Aristophanes' *Frogs* (405 BC) the god Dionysus brings Aeschylus back from the dead so that the Athenians can enjoy good drama once more; Aeschylus claims that his

Seven Against Thebes is “full of Ares” and that whoever sees it is anxious to become a warrior (*Frogs*, 1021–22).

Seven of Aeschylus’ plays survive: *Persians* (472 BC), *Seven against Thebes* (467 BC), *Suppliant Women* (c.466 BC), the *Oresteia* trilogy comprising *Agamemnon*, *Choephoroe*, and *Eumenides* (458 BC), and possibly *Prometheus Bound*, though authorship of this play has been disputed. He is said to have written some 80 plays, and he won victories with about 13 of them. Legend has it that, after beginning to compete in 499 BC, he won his first victory in 484 BC and that he was triumphant on every subsequent occasion that he competed. Fragments exist of many of the missing tragedies, rarely extensive, except in a few cases (*Myrmidones*, *Niobe*, *Prometheus Unbound*). His satyr plays were highly regarded and the more substantial of his fragments are in fact from these (*Netfishers*, and *Theoroi*, also known as *Spectators at the Isthmian Games*).

Aeschylus generally wrote his plays in the form of a thematically connected trilogy, and the only trilogy from any of the ancient tragic playwrights that survives is his. This form allows the development of a theme, as in the *Oresteia*, with its admonition that the perpetrators of crime will be punished. This is called a violent grace, accorded by the gods to man to teach him to be wise, to learn through suffering (*Agamemnon*, 176–83). A family curse shows man’s dependence on fate for generation after generation, and yet the responsibility for wrongdoing remains his. The lesson is an important one, and Aeschylus charts the transition from personal blood feud and murderous vengeance to the public law court. This trilogy was written two years after the democratic reforms limited the Council of the Areopagus to murder trials. Aeschylus shows respect for the Areopagus, but also seems to espouse the development towards democracy.

Aeschylus’ plays include many exchanges between a single actor and the chorus. As much as one half of a play can be choral, and his choruses are particularly dramatic. It is easy to imagine the *Persians* appearing in their lavish costumes, and the demonic arrival of the Erinyes, or Furies, whose appearance we are told caused women to miscarry. Aristotle tells us that Aeschylus introduced a second actor and his later extant plays show more dialogue between two actors, and, after Sophocles introduced the third actor, sometimes three.

Of the three playwrights from 5th-century BC Athens whose works survive, Aeschylus’ language is perhaps the most poetic, with his abstract usage, invented and rare words coupled with bold metaphors. He is certainly the most difficult to translate. He often takes an image and carries it throughout the play, or trilogy, as, for instance, in the *Oresteia* with the related images of net, hunt, blood, fertility, sacrifice,

and war: public pursuits that lead to private disaster.

Alone of the three great tragedians, Aeschylus deals with a historical subject, the *Persians*, less than a decade after their defeat. He showed sympathy for the enemy, a useful quality for rising statesmen in the new democracy. In this work he also extolled the merits of democracy by comparison with the Persians, who were governed by a tyrant.

When Aeschylus died, a state decree was issued allowing his plays to be entered at the tragic festivals in competition with living playwrights. Aristophanes' *Frogs* shows us that he was still held in high repute after his death, since he is shown victorious over Euripides. Soon, however, Euripides became more popular. There are few quotations from Aeschylus in writings of the 4th century BC, and Aristotle says little about him. Around 330 BC the Athenian politician Lycurgus prescribed that copies of the texts of the plays should be deposited in the official archives, and that future performances should conform to these texts. The purpose was to safeguard the plays from adaptation and interpolation by actors and producers, of a kind to which they had already become vulnerable. These copies were lent to the Egyptian king, Ptolemy Euergetes I, and would have passed into the library at Alexandria, to form the basis of the critical edition made by the librarian Aristophanes of Byzantium (c.257–180 BC). Aristophanes divided the lyrics (previously written as continuous prose) into metrical cola. He also added brief introductory comments, probably making use of Aristotle's lost *Didaskaliai* (production records). Part of these comments survive in the *hypotheses* (plot summaries) that were prefixed to the plays by later scholars in the Roman period. The composition of commentaries (or scholia) on the plays was begun in the Hellenistic period (by scholars such as Aristarchus of Samothrace, c.217–145 BC, and Didymus, ?80–10 BC). Further scholia were added in the Byzantine period.

Greek plays were popular in Rome. Quintus Ennius (238–169 BC) wrote a play called *Eumenides* that used characters from the *Oresteia*. Lucius Accius (170–?86 BC), in addition to plays based on characters from the *Oresteia*, also wrote *Persian Women*, *Prometheus*, and *Myrmidones*. For these Roman plays we have only the titles or a few fragments. In the imperial period Seneca (AD ?1–65) reworked the Greek tragedies in his ten extant plays. His *Agamemnon* and *Thyestes* are both derived in part from Aeschylus' *Oresteia*.

The selection of the seven plays by Aeschylus that we possess was probably made in the 2nd or 3rd century AD, and scholia were included for school use. After parchment gradually replaced papyrus (around the 4th century AD) the unselected plays gradually passed out of use. After the Athenian Academy was closed in 529, the classical texts

disappeared from sight for several centuries and did not reemerge until the revival of learning in the middle Byzantine period, when they were copied from the uncial into the new minuscule script. Among the scholars who wrote commentaries and handled the texts of the plays the most important are Thomas Magister (late 13th century), Manuel Moschopoulos (fl.1300), and Demetrios Triklinios (early 14th century). Triklinios brought a new metrical awareness to the amendment of the text, in particular the lyrics. The plays that were most preferred by the Byzantines were *Persians*, *Prometheus*, and *Seven against Thebes*. Giovanni Aurispa brought the “Medicean” manuscript, written about 1000, from Constantinople to Italy around 1453. This included the seven plays that survive; it is our only source for *Suppliant Women* and *Choephoroe*. The *Agamemnon* is more fully preserved in two manuscripts from the 14th century and an autograph edition by Triklinios.

Texts of Aeschylus were available in Europe from the early 16th century (six of his plays were published in 1518) but he was not a favourite at this time. For the next 400 years interest in these texts was restricted to western Europe. Opera was founded at the end of the 16th century as a revival of Greek tragedy; in the 17th century Corneille and Racine both reworked Greek tragedy. Further interest followed in the 18th century with Goethe, Lessing, and Schiller, followed by Nietzsche and Kleist in the 19th century, and other reworkings throughout Europe and America.

In 1927 Eva Sikelianos revived performances of Greek tragedy at Delphi, beginning with *Prometheus Bound*. *Suppliant Women* was performed there in 1930. This tradition still continues at Delphi. Tadashi Suzuki took his *Clytemnestra* there, after it was performed in Toga, Japan, in 1983. That same year he did *The Tragedy (The Fall of the House of Atreus)* in Tokyo. The National Theatre in Greece regularly performs the ancient plays at Epidaurus, the odeum of Herodes Atticus in Athens, and elsewhere. Tony Harrison’s and Peter Hall’s *Oresteia* was performed in London in 1981 and at Epidaurus in 1982, the first imported production in that theatre.

In 1954 Dimitris Rondiris, a pupil of Reinhardt, established two festivals to revive ancient Greek drama on a yearly basis, one at Epidaurus, the other at the Herodes Atticus theatre in Athens. In 1980 Karolos Koun directed a fine production of the *Oresteia* in which Melina Mercouri starred as Clytemnestra. Earlier, in 1965, he had done an outstanding production of the *Persians*, which was also performed in London. In 2000, Katie Mitchell directed Ted Hughes’s translation of the *Oresteia* in London. Spiro Evangelatos produced an *Oresteia* in 1990 with music by Theodorakis. This play has been performed in Greece since 1903, *Prometheus Bound* since 1917, and

Seven against Thebes since 1925. *Prometheus Bound* was performed again at Delphi in 1995, ably directed by Theodoros Terzopoulos (he had previously done the *Persians* in 1990). Karolos Koun mounted a splendid production in 1975, and Giannis Tsarouchis a particularly artistic version in 1982. *The Persians* has also been popular and has been regularly performed in Greece since 1889, with an outstanding production by Terzopoulos in 1990 which emphasized the cruel suffering that revolutionary and idealistic defiance can entail. Yearly festivals that revive ancient Greek drama in addition to the ones listed above have occurred at Syracuse in Sicily since 1914 and at Delphi in Greece since 1981.

There have also been several films made of plays by Aeschylus, such as *Prometheus in Chains* (Greece, 1927) by Costas and Demetrios Gaziadis, and *Prometheus Second Person Singular* (Greece, 1975) by Costas Ferris, *Les Perses* (France, 1961) by Jean Prat, and *Notes for an African Oresteia* (Italy, 1970) by Pier Paolo Pasolini.

Biography

Born at Eleusis c.525 BC, Aeschylus is the father of Greek tragedy. Seven plays survive. His drama is characterized by large issues and the splendour of his choruses. His trilogies showed divine justice acting over generations. He utilized spectacle to advantage, coupling it with equally spectacular poetic words. His plays have a particular appeal for contemporary audiences. He died at Gela in Sicily in 456 BC.

Aesop

Legendary fabulist

Although Aesop's very existence has sometimes been considered to be a fable, the many ancient and Byzantine statements about him may contain a historical nucleus, though this is hard to determine. The earliest reference to him is a brief passage from Herodotus (2. 134), which contains the following information: Aesop was a slave of one

Iadmon from Samos; he was a fellow slave of Rhodopis, a *hetaira* (courtesan) living in the time of the Pharaoh Amasis (570–525 BC); and urged by an oracle, the Delphians paid compensation to atone for Aesop's death, which was received by Iadmon's homonymous grandson.

These data can be compared and combined with other testimonies. The indications of the place of Aesop's origin and activity vary; some locate him on Samos, others in Lydia, but most in either Thrace or Phrygia. Strikingly enough, all of these are peripheral regions of the ancient Greek world. This may tentatively be connected with the provenance of the fable genre from abroad (Mesopotamia). However this may be, Maximos Planudes' derivation of "Aesop" from "Aethiopian" is at any rate etymologically incorrect.

Instead of Iadmon, Aristotle (fr. 573 Rose) names one Xanthos as Aesop's master. More important than the latter's identity is Aesop's alleged social status: the emperor Julian (*Orations*, 7. 3) plausibly observes that Aesop, as a slave, could not speak out but had subtly to disguise his counsels in fables.

If Aesop really existed, he probably belonged to the 6th century BC. Eusebius of Caesarea even dates his death to 564 BC precisely. Herodotus implicitly connects him with Sappho, since he reports that it was her brother who redeemed Rhodopis. An inscription of the 1st century AD (*Inscriptiones Graecae*, 14. 1297) makes Aesop a contemporary of Pisistratus, whereas Plutarch (in his *Symposium*) has him converse not only with the equally legendary Seven Sages but also with Solon, and states that Croesus, the last king of Lydia, sent him as an envoy to Delphi.

This mission was allegedly to be his death, as is already implied by the passage from Herodotus discussed above. Aristophanes (*Wasps*, 1446f.) refers to a story in which Aesop was accused by the Delphians of the theft of a bowl dedicated to Apollo. Later testimonies explain that Aesop incurred the anger of the Delphians because he exposed their habit of greedily misappropriating gifts to the oracle; whereupon they falsely accused him of sacrilege, and put him to death by stoning and/or throwing him from the rocks (*Oxyrhynchus Papyrus* 1800, 2nd century AD; Plutarch; Lucian, Himerius, 4th century AD). He was, however, avenged by Apollo. This legend, which may reflect the ritual expulsion of a scapegoat, must have been well known by as early as the 5th century BC, as indicated by the very brevity of Aristophanes' and Herodotus' allusions. The story's popularity is also indicated by the application of the proverb "Aesop's blood" to persons involved in crimes difficult to expiate (Zenobius, 1. 47, 2nd century AD; Apostolius, 1. 73, 15th century).

Aristophanes (*Wasps*, 1448) adds that Aesop told the Delphians a

fable about a dung beetle. Again, the conciseness of the passage shows that the playwright presupposed that the audience would be acquainted with the full story. An ancient commentator explains that Aesop (vainly) tried to prevent his execution by telling the Delphians a story about a tiny scarab who took a terrible revenge on the mighty eagle.

From the 5th century BC it became customary to connect fables with the name of Aesop. This was done in various ways: either Aesop was presented as the narrator of a fable on some occasion of his life, or he figured as a fable character, or the fable was simply labelled as “Aesop’s” or “Aesopic”. All these ways of ascribing fables to Aesop occur for the first time in Aristophanes’ *Wasps*. By the end of the 5th century BC Aesop’s fables must already have enjoyed great popularity, as is clear from passages from Aristophanes and Plato. The former (*Birds*, 471) considers unfamiliarity with Aesop’s fables to be a serious lack of cultivation, whereas the latter (*Phaedo*, 60) reports that they were versified by Socrates (who was unjustly condemned to death like Aesop). It is a matter of dispute whether or not these passages imply the circulation of a textbook with Aesop’s fables in Classical Athens.

The popularity of Aesop’s fables is also evident from archaeology. It is generally assumed that a red-figure *kylix* (drinking cup, c.450 BC; now in the Vatican Museum) depicting a hunch-back speaking to a fox represents the fabulist in conversation with his favourite fable character. Later testimonies refer to statues of Aesop by Lysippus and Aristodemus and describe an allegorical painting of Aesop and his fables (Tatian, 2nd century AD; Philostratus’ *Imagines*, c. AD 200; Agathias, 6th century AD). The fabulist was honoured also by literary monuments: apart from various biographical notes (in the *Suda* lexicon and prologues of fable collections) and a fictionalized *Life*, which will be discussed below, we have one fragment of an *Aesop* staged by the comedian Alexis (4th century BC; extant in Athenaeus, 10. 431).

The ascription of fables to Aesop soon became a standard practice, which lasted throughout antiquity. Fables somehow connected with Aesop’s name occur in the works of writers from the Classical (Democritus, Aristotle), Hellenistic (Callimachus), and imperial periods of Greek literature (e.g. Galen, Dio of Prusa, Dionysius of Halicarnassus, Plutarch, Lucian, Diogenes Laertius, Libanius, Themistius), as well as in early Christian Greek (St Irenaeus, St Basil the Great).

The first to compose a fable collection (Demetrius of Phalerum, c.300 BC) also used Aesop’s name as a kind of generic label. This was done by other ancient fabulists (Babrius and Phaedrus, his Latin *collega proximus*) as well, and has become customary ever since, as is

clear from the habit of Byzantine authors of quoting from “Aesop’s fables” (Michael Psellos, John Tzetzes, Eustathios of Thessalonica, Nikephoros Gregoras). Hence it has naturally, but mistakenly, been believed by some that the ancient so-called Aesopic fable collections, which are extant in many Byzantine manuscripts, were by the genre’s founding father himself. This myth was, however, definitively unmasked by Sir Richard Bentley (1699), who mainly on internal linguistic evidence convincingly proved that the prose fables cannot have been composed before the Christian era; their author must remain anonymous.

Aesop’s renown (according to some perhaps rivalling that of Homer) may be especially based upon the fables ascribed to him, but throughout antiquity and the Byzantine period his name is also connected with apophthegms and proverbs (in John Georgides, c.10th century; *codex Mosquensis*, 239, 14th century). His fame was further enhanced by the anonymous *Life of Aesop*, a biographical romance from the imperial Roman period that creatively combines traditional stories about the legendary fabulist with heterogeneous elements derived from various other sources, notably anecdotes about the Seven Sages and the Assyrian book of Ahiqar. Aesop is portrayed as a typical anti-hero, physically and socially inferior but mentally the master of his superiors, and as the champion of popular wisdom, problem-solving, and fable-telling. The text’s structure is tripartite; the setting shifts from Samos via the Near East to Delphi. Part 1 relates how Aesop, dumb from birth and enslaved, is granted first the power of speech by the goddess Isis and then freedom by his master Xanthos because, respectively, of his faithfulness and cleverness, and how he reconciles his fellow citizens with their powerful enemy, King Croesus of Lydia. In part 2 Aesop, as a counsellor of King Lycurgus of Babylon, manages to escape a plot set up against him by his adoptive son Ainos (“Fable”) and to win an enigmatic battle for his master against the Egyptian pharaoh Nectanebo. Part 3 is about Aesop’s tragic end in Delphi (see above). He is, however, with divine approval, avenged by allied Graeco-Babylonian forces.

Of this highly original and at times scabrous text three different versions are extant, viz. the ancient *G* and *W*, and the Byzantine *Pl*, named respectively after the place where the manuscript was originally kept (Grottaferrata; also containing fables of Babrius), after its first editor (Westermann; Braunschweig, 1845), and after Maximos Planudes, who made a somewhat abbreviated version *ad usum delphini* which was to become an early printing bestseller, translated into Latin, German, French, English, Dutch, Spanish, and other European languages. Modern Greek versions are the anonymous *Life of Aesop the Phrygian* (Venice, 1783) and Andreas Moustoxidis’s *Life of Aesop*

(Corfu, 1857).

In antiquity and in Byzantine times it was told (Photios and the *Suda* lexicon) that Aesop rose from the dead and was reincarnated more than once. Even if one does not believe in metempsychosis, the story of Aesop redivivus aptly symbolizes the eternal resurrection of the creation of Hellas's famous fabulist.

Biography

The eponymous father of Greek fable. Little is known of his life, and indeed his very existence is in doubt. If he existed, it was probably in the 6th century BC. He was by tradition a slave, perhaps on Samos. Fables continued to be ascribed to Aesop throughout antiquity and have been popular ever since.

Aesthetics

Although the word "aesthetics" is itself derived from the Greek word *aisthanomai* ("I perceive"), it was not coined until 1753, by the German philosopher Alexander Gottlieb Baumgarten. Since then it has gradually come to embrace philosophies of both art and beauty (whether natural or created). This is not to say that the ancients did not have a tradition of what we understand by aesthetics, i.e. a philosophy concerned with the essence and perception of beauty and ugliness.

Apart from the evidence that is implied in their creative works, we are able to form some idea of the views on art and beauty held by the Greeks from at least four types of writing: literary criticism, art criticism, philosophy, and rhetoric. One general idea that emerges from this evidence is that to the Greeks art was a representation (*mimesis*) of life. This is evident from the description of Achilles' shield in *Iliad* 18 where the artist's depiction is praised for its faithfulness to life. This was true not only of the visual arts and works of literature, but even of instrumental music. However, what the Greek thinkers understood by *mimesis* was something much broader than mere copying. It could encompass a wide range of modes of depiction and symbolism that ranged from imitative realism to imaginative idealism and embraced different accounts of the artists' relations to their creations, circling around the polarities of nature and craft, inspiration and technique. Accordingly, ancient attitudes to the representative arts include many distinctive configurations of emphasis. As Aristotle says in the 26th chapter of his *Poetics*, the artist could represent men as they are, as they ought to be, or as they are thought to be.

According to Xenophon, Socrates regarded the beautiful as coincident with the good, while both of them are resolvable into the useful. We call something beautiful when it serves some rational end, be it human gratification or human security. He seems to have emphasized the power of a beautiful object to further the more necessary ends of life rather than the immediate gratification it

afforded to perception and contemplation. For him, beauty was a relative thing. Unlike Plato, he did not recognize a “beauty itself” existing absolutely without any relation to a percipient mind. The *Memorabilia* (3. 10) records a conversation with the sculptor Parrhesius in which Socrates introduces two qualifications to the idea of representation: the sculptor can combine into one statue features that in real life belong to many people; and the artist represents not only physical features but also the soul.

The earliest aesthetic theory of any scope is that of Plato. According to him, reality consisted of forms or archetypes that were themselves imperceptible to the senses but were perceptible to the soul in its purest essence. But they were the patterns on which all objects of sense perception were modelled. Thus phenomena imitate the forms or participate in them. From the objects of sense perception the philosopher reasons to the pure forms of which they are mere imitations. But the artist merely copies the objects of sense experience without possessing a knowledge of their forms. What he produces is, thus, an imitation of an imitation. Because he did not possess the philosopher’s knowledge of reality, the artist had no claim to be the teacher of men. Plato also believed that certain types of artistic production, such as those that portrayed the character and actions of base people, were harmful to the moral and emotional integrity of their audiences. Even certain musical modes could induce laziness or incite people to intemperate actions. Accordingly, in formulating an ideal state, Plato, in the *Republic*, recommends rigorous censorship (or even expulsion) of the existing breed of poets and painters in favour of an ideal race of artist-philosophers whose creations should provide moral and political training.

Although Plato was inclined to the conception of an absolute beauty that took its place within his scheme of self-existing forms or ideas, it is not easy to determine exactly what he meant by beauty. Various definitions are rejected in his dialogues by the Platonic Socrates as being inadequate. The only notion of a common element in beautiful objects that we come across in his dialogues is proportion, harmony, or unity among their parts. According to the *Symposium*, true beauty is not something that one can find as an attribute in this or that beautiful thing. For beautiful things, although they partake of beauty, are not themselves “beauty itself”. Eros or love causes aspiration towards the pure idea of beauty that Plato also identifies with goodness and truth. According to the *Phaedo*, the soul’s knowledge of beauty itself results from recollection of its prenatal existence.

In several of his works Aristotle attempts to defend the claims of representative art as the basis of moral education, the origin of catharsis, and the instrument of character formation. He attempts to

develop certain principles of beauty and art by scientific analysis. For Aristotle, just as for Plato, aesthetics was inseparable from morality and politics. In his *Politics* (8. 5) he dwells on the power of art to influence human character, and hence the social order. In the *Metaphysics* he tries to make a distinction between the good and the beautiful: the good is always found in action, whereas beauty may exist in motionless things as well. The good may also be called beautiful under certain circumstances, although essentially they are two different things. Beauty is also different from what is fitting, and is above the useful and the necessary. The pleasure it provides is of the purest kind. The universal elements of beauty are order, symmetry, and definiteness or determinateness (*Metaphysics*) as well as a certain magnitude (*Poetics*); an object should not be so large as to prevent a synoptic view of the whole, or so small as to prevent a clear perception of the articulation of the parts.

The more mystical writings of Plato, the *Timaeus* in particular, suggest a different approach to aesthetics based on the Pythagorean theory of the cosmos or ordered universe. This exerted a decisive influence on the Neoplatonists. Among them Plotinus (born c.AD 205) accorded far greater significance to art than did Plato. The essence of his philosophy is the desire to escape from the material world. According to him, *nous* or objective reason, which is self-moving, invests form on inanimate matter, thereby turning it into a *logos* or notion whose beauty lay in its form. Objects that have not been acted upon by reason are formless, and therefore ugly. The creative reason is absolute beauty, which Plotinus calls the more-than-beautiful. Beauty manifests itself in three stages: the highest is human reason; next comes the human soul, which is less perfect because of its links with the material body; lowest of all are the “real” objects. In other words, he explains the universe by a hierarchy rising from matter to soul, soul to reason, and reason to God, the final abstraction, without form or matter, i.e. pure existence. Only the spiritual world contemplated by reason is real, the phenomenal world being a creation of the soul and, hence, a thing without real existence, while matter is only a receptacle for forms imposed on it by the soul. Unlike Aristotle, he believed that a single thing indivisible into parts might be beautiful through its unity and simplicity. He accorded a high place to the beauty of colours in which material darkness is overpowered by light and warmth. According to him, art reveals the form of an object more clearly than ordinary experience does, and it raises the soul to contemplation of the universal. When the artist contemplates notions as models of his creations, such creations may attain to greater beauty than the products of nature. For Plotinus, the highest moments of life were mystical, and by this he meant that in the world of forms the

soul was united with the divine or the “one”. Since one loses oneself in contemplating an aesthetic object, aesthetic experience comes closest to mystical experience.

The influence of Plato is also manifest in the rhetorical treatise known as Longinus’ *On the Sublime* (1st century AD). According to this author, “sublimity consists in a certain excellence and distinction in expression” and “it is from this source alone that the greatest poets and historians have acquired their preeminence and won for themselves an eternity of fame.” According to him, the sublime not merely persuades but transports the audience out of themselves. It is thus a mystic experience, an ecstasy, which is why its effect is different from that of all merely technical skills. In the 7th chapter he says: “for by some innate power the true sublime uplifts our souls; we are filled with a proud exaltation and a sense of vaunting joy, just as though we had ourselves produced what we had heard.” For him, the sublimity of a work is proved by its ability to stand repeated hearings and its unanimous recognition or universal appeal. In chapter 9 he describes the sublime as the echo of a noble mind. The sources of sublimity are: (1) the ability to form grand conceptions; (2) the stimulus of powerful and inspired emotions; (3) figures of speech and thought; (4) diction; and (5) composition. Although he makes several references to the visual arts, his prime concern is literature.

Among the Greeks, examples of art criticism are found in literary works, mostly from the later periods, which contain descriptions of works of art. One such work is Pausanias’ *Guide to Greece* (2nd century AD); another is the *Eikones* by one of the Philostrati of Lemnos who appear to have lived in the 2nd–3rd centuries AD. The latter consists of two sets of descriptions in prose of pictures that the author professes to have seen.

There was a strong tendency among the ancient Greeks to connect both art and beauty to more general considerations of human needs and values, so that their aesthetics, so far from being isolated, was involved with the psycho-sociological aspects of culture. In considering questions concerning the origin, subject-matter, form, style, and effect of the arts, several Greek writers adopted a comparative approach. The elder Simonides described poetry as vocal painting and painting as silent poetry. Aristotle, in his *Poetics*, also makes frequent references to the visual arts; and so do the later authors of rhetorical treatises, even though their analogies are often misleading.

Aetolia

Region in central Greece

Aetolia is a region in north central Greece whose southern border is the coastline along the Gulf of Corinth. Its western border is formed by the Achelōüs river, which separates modern-day Greece from Albania and in Classical antiquity marked the division between Aetolia and Acarnania. In the 5th century BC an uneven line running from the area just west of Thermopylae in the north to Naupactus on the Corinthian Gulf in the south formed Aetolia's eastern boundary; its northern border abutted the kingdoms of Macedonia and Thrace. At present Aetolia and Acarnania, as the conglomerate Aitolakarnania, comprise the most westerly nome of central Greece; this nome lies between the Gulf of Patras and Epirus. Throughout the centuries the territorial boundaries of Aetolia have dramatically expanded or contracted in accordance with the ebb and flow of the Aetolians' political fortunes.

From the 1st-century-BC geographer Strabo we learn that in antiquity Aetolia fell into two divisions: Old Aetolia and New or Acquired (*Epiktetos*) Aetolia. The area between the Achelōüs and Euenus rivers is known as Old Aetolia. Its most striking geographical features are the complex series of lagoons of the Aetolian plains and Lake Trichonis. Old Aetolia included the city of Calydon, of great mythological significance as the scene of the tragic story of Meleager, Atalanta, and the Calydonian boar hunt. Moreover, Aetolian cities gained undying fame in the catalogue of ships in Book 2 of Homer's *Iliad* (lines 638–44); the poet reports that Thoas, son of Andraimon, led an Aetolian contingent of 40 black ships in the expedition against Troy. New Aetolia extended from the Euenus river eastwards to the land of the Ozolian Locrians. This region did not have the sort of prestige which Greek mythology bestowed upon Old Aetolia; indeed, the 5th-century BC Athenian historian Thucydides (3. 94) remarks that its rude inhabitants spoke a nearly unintelligible form of Greek and ate raw flesh.

Aetolia's period of greatest power and prosperity fell between the years 338 BC, when the victory of Philip II of Macedon over a coalition of Greek city states led by Athens and Thebes changed for ever the

configurations of inter-state power relations in Greece, and 189 BC, when Rome imposed a harsh settlement upon the Aetolians in the aftermath of the Roman victory over Aetolia and its ally the Seleucid king Antiochus III. The Aetolian Confederacy (or *koinon*) held regular representative meetings in which federal magistrates were elected, had a pan-Aetolian sanctuary at Thermon, and conducted a common foreign policy.

Sometime around 300 BC Aetolia gained control of the venerable sanctuary of Apollo at Delphi. Aetolia's territorial extent in this period may be calculated on the basis of the number of votes which the Aetolians controlled in the Delphic Amphictionic Council. In antiquity Aetolia's claim to fame lay in the defence of the sanctuary in 279 BC against a Gallic attack. Although it is clear that the Phocians also played a significant role in the repulse of this Gallic incursion, the Aetolians claimed sole responsibility. Some 30 years after the invasion they reorganized the Delphic festival of thanksgiving on a grander scale and represented themselves as the heroic defenders of Hellenism against a barbarian menace. This propaganda apparently was effective: the 2nd-century AD traveller Pausanias (*Description of Greece*, 10. 19. 5) states that the Gallic attack of 279 BC was the gravest peril in all of Greek history. The historian Polybius (*Histories*, 2. 35. 7), writing in the mid-2nd century BC, reluctantly pairs the event with the great 5th-century BC Persian invasions of Greece (although he refuses to name the Aetolians as the authors of the sanctuary's preservation). Throughout its ancient history Aetolia had an uneasy relationship with the Macedonian monarchy, alternately being its ally and its enemy. In the so-called Social War (220–217 BC) the Macedonian king Philip V stunned the confederation by striking deep into its heart with his sack of the federal sanctuary at Thermon.

Aetolia is a rugged land. The lack of geographical and climatic amenities enjoyed by other parts of Greece may give some help towards understanding the Aetolian Confederacy of the 3rd and 2nd centuries BC. The Aetolian economy was based on the annual conduct of war and raiding expeditions; in some cases Aetolia granted other Greek states immunity from its marauding expeditions through treaties of inviolability, or *asylia*. The Aetolian Confederacy was essentially a nation of corsairs and mercenaries. We have already noted the negative assessment of Thucydides. The Aetolians' propaganda centred on their exploits at Delphi in 279 BC must in part be viewed as an attempt to counteract their negative international reputation. In the 2nd century BC, Polybius, as a citizen of the archenemy of Aetolia, the Achaean Confederacy, delivered in his *Histories* the most scathing indictment of Aetolia in the literary tradition (see especially the opening of book 4).

Aetolia struck up an alliance with Rome in 211 BC against Macedonia. This act hardly enhanced Aetolia's international image, as many Greeks at this time viewed the Romans as uncouth barbarians. At the conclusion of the Second Macedonian War (200–196 BC) Romano-Aetolian relations broke down as a result of a disagreement over the terms of the treaty. Aetolia was deprived of cities which it believed rightfully belonged to it; and the disgruntled Aetolians called in the Syrian king Antiochus III against Rome, which led to the aforementioned defeat and harsh settlement of 189 BC. Aetolia would never regain its former international position.

Afterlife

Greek beliefs in the afterlife were complex and contradictory, even no doubt within the same individual. We can only speculate about those that were current in the prehistoric period. Marine motifs painted on the surfaces of terracotta Minoan coffins known as *larnakes* have sometimes been fancifully interpreted as evidence that the Minoans believed in an afterlife that lay across the water. The fact that the Mycenaeans were prepared to clear away previous burials in so-called

tholos (or beehive) tombs to make way for a new interment has been taken as evidence by some archaeologists that the Mycenaean corpse was believed to be sentient as long as the flesh remained on the bones. Conversely it has been suggested that the plentiful use of gold in Mycenaean royal burials may have been intended to preserve the body from physical decay, judged to be a necessary precondition for a healthy afterlife. The belief that the dead have need of their possessions in the world to come might account for the ritual slaughtering of animals at the time of burial – a practice for which there is evidence in protogeometric as well as Mycenaean times. Myths such as that of the sacrifice of Polyxena at the grave of Achilles have been taken to suggest knowledge of human sacrifice, conceivably practised with a similar object in mind.

It is only when we have written evidence to supplement the archaeological record, however, that we can begin to identify with some degree of certainty the beliefs about the afterlife that underlay funerary ritual. Undoubtedly the most prevalent, and one, moreover, that has persisted into modern times, has to do with Hades, the subterranean kingdom where the bloodless dead lead a cheerless and monotonous existence punctuated only by the appearance of new arrivals. In the earliest surviving description of the region as provided by Homer in book 11 of the *Odyssey*, every human being with one exception ultimately enters this kingdom, irrespective of their qualities. That exception is Menelaus, who is destined to live out eternity in a favoured region known as Elysium, which is situated at the ends of the earth (4. 561ff.). It is not his virtue that has earned Menelaus his privileged status, however, but merely the fact that he happens to be Zeus' son-in-law. Homeric Hades is therefore a place of equal misery for all and contains no trace of a system of punishments and rewards that are meted out to ordinary mortals, though a few who have sinned on a truly grand scale, such as Ixion, Sisypheus, and Tartarus, are condemned to suffer never-ending torment. The rest of the dead tend to confine themselves to sententious moralizing about their past. Greek tragedy occasionally intimates that kings preserve the same status in Hades as they did in life (e.g. Aeschylus, *Persians*, 691). Judging from depictions of the handshake motif in funerary art, a popular belief in Classical Athens was that upon arrival in the underworld a reunion took place between the recently deceased and their previously dead relatives.

Though belief in Hades probably remained dominant throughout antiquity, from the 6th century BC onwards it had to compete with more nebulous philosophical ideas about the afterlife. Orphism and Pythagoreanism, for instance, taught that the soul or *psyche* experiences incarceration in the body in this world and is released

from its earthly constraints into its own element at the moment of death. Precisely what the *psyche* signified to these sects is unclear but it was without doubt a more personalized entity than a Homeric shade. The Pythagoreans also taught that the soul migrated to another body at the moment of death, since it is on a journey that will ideally lead it to a state of moral perfection. Attaining that state of perfection might therefore be expected to take several incarnations. The belief in transmigration (*metempsychosis*) seems to have been confined to philosophical circles. It is advanced in a number of Plato's dialogues, including the *Phaedrus*.

Mystery religions, of which the most important were the Eleusinian mysteries, so named because they were celebrated at Eleusis in Attica, held out the promise of a better afterlife in the case of those who underwent initiation. So far as we know, however, the promise was not conditional upon a person's conduct in this life – a circumstance that outraged Diogenes the Cynic, who poured scorn on a belief system that maintained that ethical considerations play no part in determining a person's destiny in the afterlife. The only group that was excluded from initiation were murderers, but this may have been more on ritualistic than moral grounds since the shedding of human blood caused pollution.

From elsewhere, however, there is evidence to suggest that some Greeks at least came to believe that those guilty of serious crimes would be punished in the afterlife. A notable example is Pausanias' description of a painting by Polygnotus that depicted, among other things, a man who had mistreated his father being throttled by him in the underworld (10. 28. 5). In apparent reference to Orphic belief Aristophanes in *Frogs* (145ff.) comically suggests that "anyone who has stolen from a child, thrashed his mother, struck his father or sworn falsely" will be consigned to "everlasting mud". There are also a few references in tragedy to a post-mortem judgement (e.g. Aeschylus, *Suppliants*, 230f. and *Eumenides*, 269ff.; Euripides, *Helen*, 1013ff.). Though belief in a dualistic afterlife never became universal, it made significant inroads into the Homeric picture of an undifferentiated afterlife.

At no period did the Greeks trouble themselves to formulate a clear image of the rewards that lie ahead in the afterlife for those who manage to escape the fate reserved for the rest of mankind. Very likely they merely envisioned a world whose delights in general terms were identical to the best that is on offer in this one. Such seems to have been the idea behind Elysium, otherwise known as the Isles of the Blest, described by Homer as a place where life is easiest for men and where a gentle breeze always blows. A series of Classical grave reliefs depict the dead reclining, enjoying the pleasures of the symposium.

Likewise Plato mocks the Pythagoreans for envisaging an afterlife consisting of “eternal drunkenness” (*Republic*, 2. 363c). The *Homeric Hymn to Demeter*, which incorporates the founding charter of the Eleusinian mysteries, merely states in vague terms that initiates will become “prosperous” (*olbioi*, lines 480–82). From the 5th century BC onwards a small minority of funerary inscriptions also refer to a celestial as opposed to a subterranean afterlife for the *psyche* located in the *aither*, i.e. the upper air. There is no suggestion that the dead retain any individuality or even consciousness once they have merged with this element, however. A few dead, notably Castor and Pollux, were transformed into stars, but again it is uncertain what existence they enjoyed as such.

Despite all their attempts to locate the dead above or below the earth, the Greeks found it difficult to envisage their dead as wholly incorporeal. In Classical Athens there is evidence of increasing concern with the physical well-being of the dead, deemed to be dependent upon offerings of food and drink that were placed on the tomb by their relatives, irrespective of whether the dead had been inhumed or cremated. Little can be deduced about eschatological beliefs from the method of disposing of the dead.

Agesilaus II c.444 –359 BC

King of Sparta

Agesilaus was born to a life of controversy. The younger son of king Archidamus II, he was not expected to ascend the throne. He also suffered from a lame leg, a birth defect for which he tried to compensate throughout his life. He received the ordinary rigorous training of the Spartiates, which inculcated in him a sense of duty to superiors and the law. Extremely ambitious, he harboured an arrogance that he unsuccessfully disguised under a diaphanous cloak of humility. His elder brother, king Agis II, died in 400 BC, which ignited an ugly contest for the throne. Agis' son Leotychides was

accused of being illegitimate and, despite his handicap, Agesilaus advanced himself as Archidamus' true son. The furore was fuelled by Diopeithes, an expounder of oracles, who declared that the divine will rejected a lame king, for he would bring "unexpected afflictions and whirling man-killing wars". The result of this unsavoury contest was the recognition of Agesilaus as king.

Agesilaus owed his first important military command to his lover Lysander, the famous war hero. Agesilaus' first assignment was to free the Greek cities of Asia Minor from Persian rule. Accompanied by Lysander, he sailed in 396 BC. His first land-fall, at Aulis in Boeotia, was in imitation of Agamemnon, who had sacrificed Iphigeneia there before continuing to Troy. When Agesilaus offered a sacrifice, contrary to native custom, Boeotian officials abruptly disrupted the ceremony. Agesilaus left for Asia Minor with feelings of foreboding and a fierce anger against Thebes.

Agesilaus accomplished comparatively little against the Persians. In 395 BC he unsuccessfully attacked Sardis, the principal city of Lydia, but in all he engaged in desultory operations that inflicted little damage on the Persians. He obviously had no strategic concept of how to defeat such a powerful enemy over such a large expanse of terrain. In any case, events in Greece put an end to his ambitious and unrealistic dream of conquering Persia. Thebes, Athens, Argos, and Corinth banded together to crush Sparta, and in response Sparta promptly recalled Agesilaus to meet the challenge. The Corinthian War (395–386 BC), as the ensuing conflict is known, severely strained Agesilaus' abilities and Sparta's resources.

Hurrying back to Greece, Agesilaus marched overland through the north until he reached Coronea in Boeotia. In August 394 BC he encountered a Theban and allied army, and in a furious battle made a tactical blunder that cost him dearly: he received several wounds, and his troops suffered many casualties. Despite this tactical and strategic defeat, in 391 BC he led a successful invasion of Argos and Corinth, in which he inflicted serious damage. In the following year he campaigned very effectively in Perachora immediately to the north of Corinth but again without decisive results. He fared better in 389 BC, when he defended Sparta's Achaean allies from their neighbour Acarnania.

Victory for Sparta, however, came from diplomacy not from warfare. In 386 BC the Spartan ambassador Antalcidas negotiated the King's Peace that ended the war between Persia and the Greeks. Yet those hoping that this treaty would bring peace were promptly disappointed.

As in 386 BC, Sparta resorted to diplomacy to win the peace. In 371 BC Sparta, Athens, and other Greeks renewed the common peace, but

Agesilaus expelled Thebes from it. The irony of this diplomatic victory is that it led to military defeat on the field of Leuctra, which resulted in the downfall of Sparta. In the Peloponnese pent-up anger quickly vented itself: in 370 BC Elis, Arcadia, and Argos allied with Thebes to cripple Sparta as the surest guarantee of their mutual safety. Epaminondas led them into Laconia, where they spread devastation and liberated helots and others. He next led them to the liberation of Messenia, which broke the back of the Spartan economy while raising an implacable foe on Sparta's doorstep. Agesilaus rallied his countrymen through the ordeal, but could not undo the harm for which he was solely responsible. In the following years Sparta declined and Agesilaus languished. His last encounter with Epaminondas was at the battle of Mantinea in 362 BC, a Theban victory but in which the Theban leader was killed. Agesilaus spent his declining years as a mercenary in Egypt, dying in 359 BC on his way back to Sparta.

For all his military fame, Agesilaus never won a major battle. His diplomatic policies almost uniformly led to unnecessary disaster. When he assumed the throne in 400 BC he reigned over a Sparta supreme in Greece; at his death, owing largely to his failures, Sparta was beaten and isolated. His fame survived him, but his mark on history was scarcely stellar. Diopeithes' interpretation of the warning against a lame king had come true.

Biography

Born c.444 BC the younger son of king Archidamus II of Sparta, Agesilaus was not brought up to be king. But on the death of his elder brother, King Agis II, in 400 BC, Agis' son was accused of being illegitimate and Agesilaus successfully negotiated for the throne. He had some military success against the Persians but never won a major battle and presided over Spartan decline. He died in Cyrenaica in 359 BC.

Agora of Athens

Marketplace of ancient Athens

The Agora was located to the northwest of the Acropolis. It was traversed by the Panathenaic Way and formed a large open square serving various public functions. Laid out early in the 6th century BC, it remained the focal point for Athenian commerce, culture, and politics for many centuries. It originally consisted of a square space defined by boundary stones (*horoi*). The first public buildings were erected on the west side and seem to have served the needs of the Council. When Pisistratus was in power at Athens, in the second half of the 6th century BC (566–510 BC), limited building activity took place in the Agora, which expanded gradually to the east and south. A large house-like building preceded the Tholos at the southwest corner of the Agora, but its use has not been defined with certainty; it was probably built as the palace of the tyrants and later served the domestic needs of the Council. A fountain house, supplied by a terracotta aqueduct, appeared at the southeast corner of the square, while an altar of the Twelve Gods was established at the north. The street of the Panathenaia passed diagonally through the square, as it ran from the Dipylon gate to the Acropolis. Although the line of the road goes back to the Iron Age, when it led to the cemetery of Kerameikos, it was incorporated in the Agora during the 6th century BC.

The constitutional reforms of Cleisthenes at the end of the 6th century BC (508/07 BC) were followed by considerable building activity in the Agora. Several buildings accommodated the new government, including the Heliaea (the principal law court) along the south side of the square, and the Bouleuterion (Senate House), and the Royal Stoa (or Stoa Basileios) – headquarters of the king archon, where the laws were also put on public display – along the west side. Furthermore, shrines to the Mother of Gods, Zeus, and Apollo were built along the west side of the Agora. The Assembly of the citizens (*Ekklesia*), which used to meet in the Agora, found a new gathering place on the Pnyx Hill. The Persian attack in 480/79 BC left all these buildings in ruins, as was also the case on the Acropolis. Repair works, however, took place at the Bouleuterion, the Heliaea, and the Royal Stoa, which were shortly in use again.

After the Persian invasions and during Cimon's time, the architectural development of the Agora was remarkable. Cimon is also reported to have adorned the area with trees. From 479 BC to the middle of the 5th century BC, besides the reconstruction of the buildings destroyed by the Persians, the Painted (or Poikile) Stoa, the Tholos – a round building, functioning as the headquarters of the *prytaneis* (“standing committee”) of the Boule, where they also dined

– the Herms, and the aqueduct to the Academy were built. The Painted Stoa is among the most famous buildings in the Athenian Agora. It was first known as Peisianaktios, after the man responsible for its construction, and was decorated with painted wooden panels by the outstanding painters of Athens, such as Polygnotus, Micon, and Panaenus.

The Periclean building programme in the middle of the 5th century ^{BC} did not include extensive activity in the Agora, because there was a shift of attention to the Acropolis and Attica. The work was therefore concentrated on repairs to sanctuaries and shrines, such as the altar of the Twelve Gods, the altar of Aphrodite, and the Crossroads Enclosure. Among the first new buildings were the temple of Hephaestus, which was not completed before the Peace of Nicias (421–415 ^{BC}), and the Strategeion, the headquarters of the generals.

Although the Peloponnesian War had affected the Periclean building programme, leaving several monuments unfinished, a burst of building activity occurred in the Agora during the last 30 years of the 5th century ^{BC}, indicating an interest in civic structures. The new Bouleuterion was built immediately to the west of the old one; the Stoa of Zeus Eleutherios was a religious building and an informal meeting place of the Athenians; the South Stoa I, a public market building, also housed the officials responsible for the administration of the commercial life of Athens as well as the official weights, measures, and standards; the Mint was the public foundry that produced not only bronze coins but other material in bronze required by the state, such as weights and measures. These constructions were erected with limestone and brick, demonstrating the extent of Athenian resources even in times of war. The old Bouleuterion, known as the Metroon, did not go out of use, but housed the official archives of the city and the cult of Rhea, the Mother of Gods. The construction of the South Stoa and the Mint on the south side of the Agora made this area the official commercial centre, just as the west served administrative needs.

Besides the public buildings, excavations have brought to light many establishments for private industry and commerce, especially on the southwest of the Agora, such as the pottery and metalwork workshops, as well as sculptors' and marble workers' ateliers and shoemakers' shops. These workshops were in most cases attached to the private dwellings of the artisans and trades-men. Moreover, wine shops and tavernas were found close to the east side of the Agora.

Construction works in the Agora were abandoned during the first half of the 4th century ^{BC}, because Athens was recovering from the Peloponnesian War. In the second half of the 4th century ^{BC}, when the city's economy improved, partly because of renewed activity at the

Laurium mines, a new fountain house was built at the southwest corner, as well as a water clock, and the monument of the Eponymous Heroes was located in front of the Bouleuterion, the latter used for the posting of civic announcements. On the west side of the Agora was the shrine of Zeus Phratrios and Athena Phratría and the temple of Apollo Patroos. The square peristyle at the northeast corner of the Agora housed the law courts, as indicated by the finds of scattered bronze discs, which are identified as public ballots. Associated with the law courts is the state prison, recognized in a building located outside the southwest corner of the square, which dates from the middle of the 5th century BC.

The prosperity of Athens in the 2nd century BC and the benefactions of the eastern monarchs revived building activity in the Agora. The erection of the Middle Stoa, the East Building, and the South Stoa II created a complex, the South Square, which cut off the south half of the square from the north, changing the plan of the Agora. The most likely suggestion about the function of the complex is that it was a commercial centre, the two stoas serving as market buildings. Moreover, a two-storey colonnade, the gift of Attalus II, king of Pergamum (159–138 BC), housed stores and closed the east side of the main square. Also built at this time was the new Metroon on the west side of the square. The remodelling of the 2nd century BC gave a different appearance to the Agora, which it retained for the rest of antiquity. Its area was 50,000 square metres; all sides were now enclosed by colonnades; and the open central square became smaller, divided into two unequal halves by the Middle Stoa.

In 88 BC the Athenians sided with King Mithridates of Pontus in his revolt against Rome. For this reason Athens was besieged in 86 BC by Sulla, and several monuments of the Agora were damaged. Among them the Tholos, the southwest fountain house, the Heliaea, South Stoa II, and the East Building seem to have been destroyed; the Tholos was the only monument soon to be repaired. The south side of the Agora was later reoccupied by private industrial activities, such as iron foundries, potters' kilns, and marble-workers' workshops. In the time of Hadrian this area was cleaned up and restored to public use.

An important development in the Agora during Roman times was the construction of a marketplace to the east, in the form of a large open courtyard surrounded by colonnades. The construction, which started with Julius Caesar and was completed by Augustus around 11–9 BC, affected the plan of the old Agora. Thus it was no longer thought necessary to maintain the central open square, which was soon covered by the Odeum of Agrippa, housing musical performances, and the temple of Ares; the latter was a 5th-century building standing somewhere in Attica which was dismantled and re-erected in the

Agora.

Limited construction works took place in the Athenian Agora during the 1st century AD. The southwest and the southeast temples were erected from reused materials and the civic offices were built at the southwest corner of the square. Additions were also made to already existing buildings, such as an annex behind the stoa of Zeus, probably to house the imperial cult, a columnar porch to the Tholos, and a Doric propylon to the entrance of the Strategeion.

During the reign of Trajan Athens went through a period of prosperity. The earliest building in the Agora, dating to the 2nd century AD and situated along the Panathenaic Way just south of the Stoa of Attalus, was a public library, built by Pantaenus, the son of Flavius Menander. South of the library, a complex of shops was built in the middle of the 2nd century AD. An Ionic porch fronted the shops and was aligned with a similar one in front of the library, so as to create a fashionable street colonnade. Around the same time, during the reign of Trajan, the basilica at the northeast corner of the square was built. It was a three-aisled hall, which served as a law court, but also for commercial and administrative needs. Another 2nd-century addition to the Agora was a Nymphaeum, an elaborate fountain house, built west of the Panathenaic Way. It was begun during the reign of Hadrian, and completed in AD 140 under Antoninus Pius. A round building in front of the Stoa of Attalus, probably built to shelter a statue, dates to the Antonine period. At about this time the Odeum of Agrippa was rebuilt. Lastly, a library was erected by the emperor Hadrian (AD 117–38) to the east of the stoa of Attalus. Throughout the 2nd century AD the Agora flourished as a commercial and cultural centre.

The Athenian Agora was seriously damaged by the Herulians, a tribe who invaded Greece from the north in AD 267. They sacked and burned many cities, including Athens. The temple of Hephaestus survived, and excavations in the surrounding area indicate that several civic buildings on the west and north sides of the Agora, such as the Tholos, the temple of Apollo, the stoa of Zeus, the Royal stoa, and the Painted Stoa, continued to stand, though they were perhaps damaged.

Although the 4th century AD was a period of decline, limited reconstruction work took place: in the Agora the Metroon was restored, the wall of the Tholos was strengthened, and many of the houses were reoccupied. Towards the end of the century, in AD 395, Alaric and the Visigoths reached the walls of Athens; the literary sources disagree about the damage caused to the city, but excavations indicate that such buildings as the Tholos, the temple of Apollo, and the Stoa of Zeus, which survived the Herulians, were destroyed and

abandoned.

After the departure of the Visigoths there was a new burst of building activity in the area of the old Agora. A large part of the square was taken up with a gymnasium complex and a porch, the so-called Porch of the Giants. Moreover, the eastern stoa of the library of Pantaenus was rebuilt with a second storey and served as a façade to a new public complex built on two levels.

Agriculture

In many regions of the Mediterranean agriculture underwent little change between antiquity and the modern age. The socioeconomic and technological developments that have affected the ancient traditions of agriculture have been relatively recent. Ethnographers have found a number of similarities between the cultivation techniques of today and those described by early Greek poets such as Homer and Hesiod.

Ancient and traditional agriculture in Greece has two major factors broadly in common: climate and terrain. The continuing impact of these factors, combined with the extensive survival of cultivating cereals, vines, and olives, has ensured that many techniques of ancient agriculture have survived for thousands of years. The pioneering work of Paul Halstead has revealed a great deal about the traditional agricultural techniques that have survived among the Greek peoples of the Mediterranean.

The recommendations of ancient authors on agriculture sometimes amount to little more than aphorisms or ethical guidelines. In some respects, practice may have differed from such advice. Ancient authors advocate that fields should be left fallow for a year so that the soil could be rested. But pressures on subsistence farms may have required the cultivation of land that otherwise might have been left temporarily idle. A compromise may have been found by planting different crops on land sown previously with, for example, cereals.

Some leases outlining the obligations for the cultivation of land have survived from antiquity. An example from Piraeus allows land to be ploughed for the nine years of the agreement, but in the tenth it

was to be left fallow (*Inscriptiones Graecae*, ii², 2498). Such strictures indicate the importance attached to leaving land fallow. The need for such guidelines also suggests that farmers may well have avoided leaving fields fallow for a year.

The cultivation of cereals, vines, and olives has remained central to Greek agriculture from antiquity. The climate – broadly speaking, low annual rainfall, dry summers, mild winters – is typical of the Mediterranean. Some regions had superior soil, others more favourable microclimates. A rich, ruddy, fertile soil was a distinctive feature of Boeotia; Thessaly enjoyed extensive tracts of land ideal for the cultivation of cereals. Some regions were famous for specific types of produce: honey in Attica from Classical to Roman times, wine from Chios, Cos, and Thasos, and olive oil on Samos.

Although it is dangerous to generalize, it is clear that the spread of olive, grain, and vine cultivation throughout the Mediterranean world and the location of Greek colonies from the archaic period were not mutually exclusive. It is no coincidence that those areas colonized were seldom unable to support these three crops, and in particular the olive.

The olive was grown by most Greek communities. Highly resistant to low rainfall, but cultivable only at relatively low altitudes, olive trees were long lasting and required little maintenance. Olives could be harvested every other year, but the trees would take 10 to 15 years to reach fruit-bearing maturity. Harvesting took place in autumn or early winter, but the particular timing would have varied from region to region. Olives provided not only foodstuff but also oil, which in turn was used as a base for perfumes and medicines, as fuel for lighting, and for athletics and bathing. The relatively simple cultivation and harvesting of the olives was a less complex task than the production of the oil itself. Processing oil required crushing, pressing, and separation of the olive. Beam presses and rotary mills were the most common devices for crushing and pressing. The study of ancient olive presses has been informed by the examination of presses still used today, where the beam press has remained little changed from antiquity.

Vines were altogether a far more labour-intensive crop to cultivate, maintain, and harvest. The spread of viticulture into southern Spain and the Black Sea cannot be separated from the diffusion of Phocaean and Greek settlers respectively. Vine growing and so wine consumption was a major feature of Hellenic civilization, and the legacy continues today. The ancient symposium was centred around the drinking of wine, albeit diluted with water. The great festival in honour of Dionysus, the Anthesteria, celebrated in late February the new wine, and the wine storage vessels were symbolically opened on

the first day of the ceremonies.

The centrality of agriculture to ancient Greek life is nowhere more apparent than in the cultivation of cereals. The two most important crops, barley and wheat, were usually sown in autumn. Of the different types of wheat, the best bread-making, light wheat (hexaploid) was grown in the Black Sea region where the cooler climate and higher rainfall were more suitable for this very popular but less hardy variety. Although wheat is generally more vulnerable to extremes in climate than barley, it is more nutritious and has a much higher yield. It was therefore widely preferred. But the higher-quality bread wheats were not as well suited to the climate in most regions of Greece, especially those in the south. In the second half of the 19th century wheat was far more widely cultivated than barley, on a ratio of 3:1. The evidence from Classical Greece indicates that barley was the more common of the two crops. The high population densities, patterns of land-ownership, and farm size may have affected the selection of barley as the preferred crop. Even the best breads in antiquity were more coarse than many of those today, while barley was a main ingredient for the large variety of “cakes” eaten in antiquity.

The selection of crops for cultivation was probably driven to some extent by expected yields. The vulnerability of cereals to frost when the crop was young and green, to shortfalls in rain when ripening, and to too much rain before harvest were far greater problems for wheat than for barley. An inscription from Eleusis recording the contribution in 329–328 BC of first fruits from Attica and the Athenian-controlled territories of Lemnos and Imbros suggests that more barley than wheat was dedicated at Eleusis. It is likely that the figures reveal that there was a poor harvest in Attica that year, and that wheat yields would have suffered more seriously than barley.

Agriculture in Greece rarely concentrated on any one of the three main crops. It is almost certain that most domestic Greek farms would have practised polyculture. Farmsteads devoted to the intensive production of one crop are known but exceptional; a large number of industrial “farms” are known at Chersonesus in the Crimea where estates were exporting their produce, probably wine. Legumes, pulses, and figs could have been grown in many areas. A variety of crops were probably grown on a typical farmstead. Intercropping, the planting of cereals, trees, vines, and pulses on one plot of land, was a likely feature of the Greek farm.

Archaeology cannot always confirm the nature of occupation in some rural establishments. A considerable amount of evidence indicates more permanent installations, some of which we might describe as farms. The Greek farm probably took many forms. People

may have worked land close to their settlement, walking out to their fields daily or living in temporary shelters. Ancient and traditional Greek agriculture has generally centred around nucleated settlements, villages, or towns. Patterns of land tenure, the nature of agriculturally productive land, and sometimes issues of security have all influenced the location of settlement. It is now believed that a typical Greek household in antiquity would have had sufficient land to provide for its members. In some communities this may have been more an ideal than a reasonable ambition. Archaeological survey is suggesting that many ancient communities would have been of a size that could be sustained from local agricultural produce.

Excavation and archaeological survey in the rural landscape over the last 30 years have advanced considerably our knowledge of settlement in the countryside. Farms can be difficult to identify. Buildings with or without agricultural functions are often indistinguishable. But ancillary constructions such as threshing floors, olive presses, and field walls – all of which have changed little since antiquity – usually confirm the agricultural concerns of the building. Buildings with towers are a familiar type of rural building often used as a farm and are found throughout the Greek countryside. Aerial photography has revealed the extensive use of retaining walls in the Greek countryside and illustrates the extent to which more marginal land was exploited throughout history. However, it is very difficult, perhaps almost impossible, to date accurately such retaining or field walls.

The margins of survival for the subsistence farm may have been slim; a sequence of bad years would have had a severe impact on the household. Household size would have fluctuated as children matured, moved away, or stayed at home and married, as children were born, and their grandparents died, as slaves were bought or sold.

The intensification of agricultural production by purchasing slaves or using animals for ploughing or transporting may have been too much of a burden for the small farm. Cooperation between neighbours or members of the extended family may have allowed resources to be used within rural communities. Smaller farms were probably unable to support extensive animal farming. Larger herds would have been tended on more mountainous or marginal lands, and there is plenty of direct and indirect evidence for the extensive use of such land in the Classical period.

Storing agricultural produce was one method of protecting against shortfalls in harvests, but such methods could provide only limited amounts. A number of farmsteads in the Greek countryside consisted of a house with a tower-like structure. Such features have survived in the Mediterranean from antiquity. It is almost certain that the tower

structure on such farmsteads was used for storing produce and property and on occasion for security.

Human interference was probably the greatest threat to agricultural security, in both real and conceptual terms. The interruption of agricultural activities by warfare is a major feature in Greek history: perhaps most famously, the Spartans and their allies timed their invasions of Attica during the Archidamian War (431–421 BC) to coincide with the harvest period, a critical moment for those who were required to gather the crops. Such interruptions in the agricultural year, at their most extreme the cutting off of cities from the surrounding countryside by siege, presented the most common need for food supplies to be brought in from outside a Greek community.

The connections between life in ancient Greece and agriculture are difficult to separate; the Athenians found it difficult to move from the countryside into the city during the Peloponnesian War (Thucydides, 2. 16. 2). All communities in ancient Greece were dependent on agricultural produce for supplies of food (Plato, *Republic*, 369d, 371c, 372c–d); those communities that could grow all their own grain had considerable advantages over those who needed to import food supplies (see Thucydides, 6. 20. 4).

Self-sufficiency (*autarkeia*) was an ideal that features in many ancient Greek authors when assessing structures such as the household or the polis (Plato, *Laws*, 5. 744b–e). There are few extant works that treat explicitly the art of agriculture: Xenophon's *Oikonomikos* has a great deal to say about agriculture; Theophrastus heralds a higher level of scientific understanding of botanical observation (*Research on Plants* and *Plant Explanations*) in the later 4th century BC. But common to almost all Greek literature is the primacy of agriculture: the shield of Achilles (Homer, *Iliad*, 18. 541ff.) includes a rural scene of ploughmen wheeling their teams of draught animals; the Linear B tablets are full of ideograms and logograms that allow the scribes to maintain the palace accounts of agricultural produce.

The continuing importance of agriculture to Greek life is seen most clearly in the work of archaeological surveys carried out in a variety of locations such as Messenia, the southern Argolid, Nemea, Methana, Boeotia, Aetolia, Ceos, Melos, Crete, and Lesbos. Common to these studies is the observation of the human impact on the Greek landscape over a long period of time. The surveys present findings from geological prospecting to the results of research on recent land use. The collation of statistics, anecdotes, and records of agricultural activities and settlement during the 19th and 20th centuries has produced important information for both comparative and quantitative studies of Greek agriculture.

Alchemy

Despite its Arabic prefix, the word “alchemy”, like “chemistry”, appears to be derived from the Greek root *cheo*, meaning “I pour”, and its ostensible purpose is the transmutation of metals. As Jung and his followers have shown, however, the process was often treated by its more erudite exponents as a symbol of therapeutic operations on the soul. Mircea Eliade has demonstrated that in many ancient cultures the artisan enjoyed the reputation of a sorcerer, and was credited with skills beyond human science. Thus in Greek mythology Prometheus, the discoverer of fire, is the creator of human beings, while two smiths, the mortal Daedalus and the god Hephaestus, were said to have fashioned animated creatures. It is striking that all suffered injury as a consequence of their follies or misdemeanours; Zeus reserved the severest retribution for the Titans, who invented iron weapons in their war against the gods. The literary tradition pays little honour to the Cyclopes who stoked the fires of Aetna, or to the Telchines who combined the arts of witchcraft and metallurgy in Rhodes. In Israel, where all images were forbidden, there could hardly be such a thing as a pious craftsman: in the apocryphal Book of Enoch the use of stones and metals was traced back to the fallen angels, while in Genesis 4 all brass and iron artifacts, as well as musical instruments, were invented by the posterity of Cain.

The first Greek to display the classic features of the alchemist is Empedocles (fl. 480 BC), whose theory that every natural kind is formed by a specific combination of the four elements appears to have been the basis of his pharmaceutic remedies for disorders of the soul. The story that he died by leaping into the crater of Aetna, leaving only a golden sandal, is consistent with his magian character. Nevertheless, the first alchemical literature is attributed to the atomist Democritus and his school. He himself is credited with four treatises on the tincture, or immersion, of gold, silver, stones, and “purple”, while fragments survive of a fifth on *Physical and Mystical Matters*. These overlap with the *Baphika*, or *Tinctures*, which has survived under the name of his pupil Bolus, though certain parts at least must date from the early Christian era. This maintains that every natural substance can be produced by the application of a tincture (*baphe*) to iron, copper, tin, or lead. Tincture is the addition of a solvent to a metal, which precipitates new substances according to a fixed succession of colours (black, white, yellow, and red). These correspond to the four elementary metals, but even these are reducible to lead, which, when converted to its liquid state by blackening, or *melansis*, is the prime matter of all the elements and the basis of all ensuing transformations.

To know what one is making, one needs to be acquainted with the combinative properties of the reagents, or, as Bolus says, their sympathies and aversions. Sulphur, which is said to evince an extraordinary affinity with metals, is the most potent of the additives, but the ingredients of the process also include a golden alloy, Pontic rhubarb, and Italian wine.

This religious and anthropomorphic imagery, so alien to the style of the real Democritus, is justified by an appeal to books allegedly deposited in a temple by the Persian sage Ostanes. Despite this, the majority of relevant documents are papyri from Egypt, and they leave little doubt that the poetry of the Greek alchemists originated there. The esoteric lore of Ptolemaic and Roman Egypt was collected in the *Hermetika*, so called because its contents were attributed to Hermes Trismegistus; it was he, or rather his Latin equivalent Mercury, who gave his name to the liquid essence that later alchemists used as the catalyst in their experiments. The most remarkable symbol of transformation in the philosophical portions of the *Hermetika* (often arbitrarily separated from the esoteric writings) is the *krater*, or cup, of Treatise 4, which conflates the alchemist's crucible with the mixing bowl of Plato's Demiurge (the creator of the universe). It is possible that the Egyptian name Poimandres, given to the self-transforming Mind who imparts the initial revelation in Treatise 1, commended itself to the Greeks because of its likeness to the word *poimandria* ("cauldron"). Though nothing survives in extenso under Hermes' name, he is mentioned in extant treatises as the writer of authoritative works.

The Hellenization of Egyptian literature was partly the work of Jews, and thus one is not surprised to find a papyrus which conflates the wisdom of the pharaoh Kufu with that of the Hebrew Sabaoth. No doubt it was under Jewish influence that the goddess Isis, in another alchemical papyrus, becomes a pupil of the angel Amnael and gives instruction to Horus in the role of a prophetess. Since Jewish writers generally saw cunning as a property of women, they attributed the invention of the chief alchemical instruments to Maria, another prophetess and a pupil of Ostanes. Her devices included the alembic for distillation, the conical pot, or *phanos*, for sublimation, and another vessel, the *kerotakion*, for change of colours. Sulphur again is the element to which these new refinements are applied. Since the Democritean corpus does not allude to Mary, we may assume that she is a later figment; the readiness with which this alien woman was admitted into the canon is an indication that alchemy had already become a syncretistic faith.

Most of our information about Mary comes from the pagan Zosimus of Panopolis (fl. AD 300) in Egypt, whose works are both the most

copious and the most interesting vestiges of the ancient practice. The scholarly Neoplatonist Olympiodorus in the late 4th century thought them worthy of a philosophical commentary. Yet Zosimus, for all his pretensions, offers no philosophy in the strict sense, but rhetorical accounts of private visions, which leave us doubting whether they are remembered or imagined, and whether he is recounting a chain of episodes or describing one event in different ways. The usual polarity between the dense substrate and the fluid solvent is presented in such a manner as to make the first analogous to the body and the second to the soul. The self, which is both the subject and the goal of transformation, is represented as a man of various metals, who stands beside the crucible as a priest before an altar, then assumes the role of victim by dismembering and devouring his own flesh. This figure (the homunculus of Goethe and Paracelsus) is identified with Adam, who, with a clear allusion to the book of Genesis, is styled the virgin earth in Zosimus' *Treatise on the Omega*, where the experiment culminates in an (uninterpreted) vision of the Son of God. We may assume that mercury (or honey, as it is also called) is the object seen with the outward eyes, but of course this is merely the symbol of a mental revelation, which enables the philosopher to return to his proper dwelling place, escaping the fatal influence of the stars. Though Jung may be right to understand these visions as a manifestation of archetypal images, their content is (as one would expect) determined by the literary traditions that were available to a mystic of that era. With the Jewish and Christian vocabulary are mingled the names of Enoch, Zoroaster, and Ostanes, but the stories of Jewish captivity under Nebuchadnezzar (the statue of diverse metals, the blazing furnace, the degradation of the king) are surely the most important prototype.

Zosimus, like the Gnostics of the 3rd century AD, relied on a lost compilation by Nicotheus, "the Hidden One", and alchemy appears to be entwined with the very roots of the Christian heresy (*Omega*, 11; cf. Porphyry, *Life of Plotinus*, 16). The (Phrygian) Naassenes of the 2nd century derived both matter and spirit from a "single blessed substance", and maintained that the soul is in constant oscillation between the two. The first man (whose ethnic character is disputed, as in Zosimus) is called Adam because he is present in every one of us as a living stone of adamant. Hermes is the spiritual demiurge who effects our liberation, while the mutilated deities Attis, Osiris, and Dionysus offer symbols of rebirth. The last named should remind us of the notorious Greek myth in which the Titans tear apart and eat the infant Dionysus, son of Zeus. After Zeus destroys them with a thunderbolt, humanity is created from their ashes, owing its divine spirit to Dionysus and its vices to the intractable Titanic residue.

Alchemy became the guiding principle of a universal science, which allotted the names and colours of different metals to the four humours, the seven ages, and the planets, which were thought to influence both. In addition, the alchemist was required to be a skilled herbalist and an expert in the medical and prophylactic properties of gems. Affinities were easily discerned between alchemical symbolism and the New Testament, where Christ is both the apex and the foundation of a temple which is identical with the body and yet made up of “living stones”. Synesius of Cyrene (*ft.* AD 400) wrote a commentary on the Democritean corpus, while the notion of a single blessed substance that “becomes all things” was adapted to meditation on the Trinity by Evagrius (*Epistle* 29). Yet a discipline that purported to derive its code from nature could transcend not only the bounds of race and Church, but those of orthodoxy and heresy. Book 9 of the 13th-century epic *Parzival* by Wolfram von Eschenbach alludes to a legend cherished by the Cathars, and therefore perhaps of eastern (Bogomil) origin, according to which the Holy Grail was a stone cast out of heaven and assigned to the custody of fallen angels. Being thus an emblem of both Christ and Adam, it is able, when the proper question is put to it, to heal the bodily ailments which result from the transgression of the soul.

Alcibiades 451/50–404/03^{BC}

Athenian general and politician

Born into a wealthy family, Alcibiades became the ward of Pericles

and his brother Aripbron after his father Cleinias was killed at the battle of Coronea in 447 BC. Although he had fought at Potidaea in 432 BC, where he was wounded and his life saved by Socrates, his first datable political activity was in 420 BC in the immediate aftermath of the Peace of Nicias, which had ended the first phase of the Peloponnesian War (Thucydides, 5. 43). While Nicias advocated that diplomatic pressure should be exerted on the Spartans to persuade their allies to conform to the treaty by carrying out agreed concessions to the Athenians, Alcibiades sought to exploit the Spartans' difficulties with their allies, even at the expense of the peace. He won the argument and an alliance was made with the Argives and two of Sparta's renegade allies, Mantinea and Elis, but he was unable to obtain sufficient votes to secure the necessary resources to support his policy: only 1300 Athenian troops fought at the battle of Mantinea in 418 BC, when victory enabled the Spartans to recover their lost allies and restore their domination of the Peloponnese.

Thucydides comments on Alcibiades' youth in 420 BC; he reports that Nicias referred to him as "a young man in a hurry" in the debate on whether to send an expedition to Sicily in the spring of 415 BC (Thucydides, 6. 12). Alcibiades was handsome and eloquent, and his charisma had been enhanced by his success in the Olympic festival of 416 BC, when three of his seven entries in the chariot race were placed first, second, and fourth. His advocacy of the Sicilian expedition clearly contributed to the atmosphere of great enthusiasm and high expectations; Thucydides reports that in the end those opposed to the scheme did not dare to vote against it (6. 24). Nevertheless, his flamboyance and palpable personal ambition created mistrust, helped by the deviousness he had shown in an ostracism campaign, probably in 416 BC, when he had agreed with Nicias that they should protect one another by directing their supporters to vote against Hyperbolus (who was then ostracized) and then by a highly unusual proposal to appoint Alcibiades sole commander of the expedition (which was rejected in favour of his sharing responsibility with Nicias and Lamachus); and in the public hysteria that followed the sacrilegious mutilation of the many busts of Hermes on the streets of Athens, his enemies were able to link him with rumours of revolutionary plots to establish oligarchy or tyranny.

When the expedition reached Sicily and Nicias favoured a concentration on limited objectives, Alcibiades failed to support Lamachus' proposal of a direct attack on Syracuse, the chief threat to Athenian interests, which might well have succeeded. Instead he forced Lamachus to back his own plan first to secure more allies, despite their having failed to receive the expected help from Thurii, Rhegium, and Segesta. Alcibiades' policy was adopted with limited

success, Naxos and Catane being won over, but Messana and Camarina refusing. At this point he was recalled to stand trial, but, knowing that his enemies at home had been poisoning minds against him since his departure, he eluded his escort at Thurii and fled to the Peloponnese, the Athenians sentencing him to death in his absence.

It is debatable how far Alcibiades' recall affected the Athenian forces, because Nicias now supported Lamachus' plan; after twice defeating the Syracusans outside their city, in the early summer of 414 BC he was completing a series of blockade walls around the town and had high hopes of its surrender. Alcibiades, however, had gone to Sparta and urged the Spartans to send help to Syracuse, emphasizing the extent of Athenian ambitions and their threat to the Peloponnese, and suggesting that the Spartans should at least send a competent general to organize its defence (Thucydides, 6. 91). The Spartans were persuaded and sent Gylippus, whose leadership of the Syracusans was a major factor in the disastrous defeat of the Athenians in 413 BC.

In 412 BC Alcibiades was influential in persuading the Spartans to send ships to the eastern Aegean in order to foment revolts among Athens' allies; he himself helped to win over Chios and Miletus. Meanwhile, king Agis, whose wife he had seduced, persuaded the Spartans that he was unreliable and should be eliminated, but he took refuge with Tissaphernes, satrap of the Anatolian coastal provinces, whom he sought to turn against the Spartans, also hoping thereby to facilitate his own recall to Athens. He then tried to promote a sympathetic regime there by promising that the removal of democracy would secure Persian help; and, although negotiations between Tissaphernes and the Athenian envoys failed and the Persians made a treaty with Sparta, the move against democracy, which had started, succeeded, and a short-lived oligarchy was set up in summer 411 BC.

Ironically, Alcibiades' exile was now cancelled by the commanders of the Athenian fleet at Samos, who refused to accept the oligarchy's authority. On joining them he played important roles first in preventing them abandoning their position in the eastern Aegean to attack Athens, and then in victories over the Spartans in the Hellespont (autumn 411 BC) and off Cyzicus (spring 410 BC). This must have been the period in Thucydides' mind when he said that "his conduct of the war was excellent" (6. 15), and he went on to recover Byzantium in 408 BC.

At this point (407 BC) Alcibiades thought that it was safe to return to Athens. There he received a warm welcome, his exile was officially rescinded, and he enhanced his popularity by organizing the annual procession to the festival at Eleusis to go by land for the first time since the Spartan occupation of Decelea in north Attica in 413 BC. There was still, however, according to Xenophon (*Hellenica*, 1. 4. 17),

underlying mistrust of his ambitions and, when he briefly left the fleet in charge of his helmsman Antiochus, who was rashly provoked by Lysander and lost 22 ships, he was relieved of his command and prudently retired into exile. About a year and a half later Aristophanes in his *Frogs* had Dionysus say about him that the city “longs for and hates him and wishes to have him” (line 1425). But he was still in exile near the Hellespont in the late summer of 405 BC, when his warning to the Athenian generals of their folly in beaching their fleet at Aegospotami was disregarded and a surprise Spartan attack took all but eight ships almost without a fight and effectively won the war. After Athens’ surrender in 404 BC Alcibiades crossed to Asia, where he was soon killed, probably on the orders of Pharnabazus, satrap of Phrygia, at Lysander’s request.

Tradition held that Alcibiades was both the object of Socrates’ passion and his pupil, and this association, it seems, was much in the mind of Socrates’ accusers when they charged him with corrupting the city’s youth. Plato had him figuring prominently with Socrates in his *Symposium* and *Alcibiades I* (*Alcibiades II* is almost certainly not Platonic). Paired by Plutarch in his *Parallel Lives* with the Roman Coriolanus, he was taken up, like Coriolanus, by Shakespeare, who used him in his historically inaccurate *Timon of Athens*. He has continued to fascinate the modern world, notably as the central character of Peter Green’s novel *Achilles His Armour* (1955).

Biography

Born in Athens in 451 or 450 BC, Alcibiades was brought up by his guardian Pericles and was a pupil of Socrates. As a politician he was flamboyant but inconsistent, supporting first Athens, as one of the leaders of the disastrous Sicilian expedition, then Sparta. Losing the confidence of both, he fled to Persia but was subsequently recalled to direct operations of the Athenian fleet. Exiled again, he crossed to Asia after the defeat of Athens in the Peloponnesian War and was murdered in Phrygia in 404/03 BC.

Alexander III the Great 356–323 ^{BC}

King of Macedon

After the assassination of his father king Philip II of Macedon, at Aegae (modern Vergina) in 336 ^{BC}, the 20-year-old prince Alexander acceded to the throne as Alexander III. The vast kingdom of Macedonia that he inherited extended eastward at this time to Thrace and the Black Sea, south to Thessaly, west into modern Albania, and north into the former Yugoslav republics and parts of Bulgaria. As a kingdom, it was politically distinct from the city states of the Greek mainland, although there had been contact between Macedon and Greece for hundreds of years. To give a few examples: an ancestor of Alexander III of the 5th century ^{BC}, king Alexander I, was known as “the philhellene” because of his alleged secret help to the Greeks during the Persian Wars, and Greek cities founded along the east coast of Macedonia and in Chalcidice certainly had been in contact with the Macedonians for centuries. Most importantly, recent archaeological investigations in Macedonia have shown beyond doubt that there were close links between aristocratic Macedonian society and the culture of mainland Greece: Attic pottery was imported to Macedonia by the end of the 6th century ^{BC} (found in cist graves at Sindos); the city of Pella (developed as the new capital at the end of the 5th century ^{BC}) has revealed the best extant pebble mosaics, impressive small finds from the agora, and the recently excavated royal palace, besides being the place where the great Athenian tragedian Euripides ended his life in exile; and the spectacular gold and silver vessels, armour, and jewellery from the 4th-century ^{BC} royal tombs at Vergina prove beyond doubt that the Macedonian court class was a rich, cultivated, and sophisticated society completely familiar with the culture of Greece. None the less, there was a deep-seated ethnic rivalry between Macedonian and Greek that the troubled political situation of the 4th century ^{BC} intensified. Throughout his life Alexander appears to have regarded the Greeks with suspicion, and never trusted them in political terms.

Alexander’s father Philip II had become the political leader of

mainland Greece after his defeat of the Greek forces at the battle of Chaeronea in Boeotia in 338 BC. He controlled the city states by enrolling them in an unequal alliance with him known as the League of Corinth (where the first meeting was held), and enlisted his Greek “allies” in a war of revenge against the Persian empire, ostensibly to free the Greek cities of Asia Minor from Persian rule, but in all probability to extend Macedonian control into Asia Minor. The young Alexander inherited control both of the League of Corinth and of the war to win the “freedom of the Greeks of Asia”. It is on this basis that he undertook his famous expedition to the east, which has immortalized him as one of the greatest conquerors of all time, worthy of the epithet “the Great”. Alexander’s military campaigns, his defeat of the Great King of Persia and assumption of that title and position, his further expedition to the Indus river system in the Punjab, his return to the west after a troop mutiny, and his untimely death at Babylon in June 323 BC are all well known and described in an ever-expanding bibliography. His extraordinary military exploits and invincibility inspired later generals (Pompey, Caesar, Augustus, Trajan, and even Napoleon) to emulate him, and his early death at the pinnacle of his fame ensured his elevation to heroic legendary status and his position as a quintessentially romantic, fascinating historical figure.

Alexander the Great’s contribution to the Hellenic tradition must be assessed in various ways. Merely to assert that he was the greatest and most famous figure in Greek history whose allure has lasted to modern times is not enough; although this claim alone may justify Alexander’s place in posterity, it is a simplistic view based on our admiration for his achievements and fascination with such an enigmatic man. Various issues emerge from the study of Alexander, however, that are relevant to our appreciation of him in the context of Hellenic tradition. These embrace fields as diverse as art history, political developments, religion, and literature.

During his lifetime Alexander was responsible for an innovation that had important consequences for the history of Greek art. Up to the end of the 4th century BC the medium of portraiture was confined to “generic” portraits (a suitable type depicting a noble statesman, a general, etc.) and “imaginary” portraits (e.g. a hypothetical depiction of Homer; if a poet called Homer had indeed existed in the 8th century BC, certainly no one hundreds of years later could have known what he looked like) (see G.M.A. Richter [rev. by R.R.R. Smith], *The Portraits of the Greeks*, Oxford: Phaidon, 1984). Although the beginnings of individualistic portraiture may be traced to Persian kings and satraps of the 4th century BC, Alexander seems to have been the first ruler in the Greek world to control the production of his own

image. The ancient sources tell us that he had a court sculptor, a court painter, and a court gem engraver whom alone he trusted to depict him in the approved manner. The surviving portraits of Alexander show that he was represented in a highly idealized way that was immediately identifiable (see J.J. Pollitt, *Art in the Hellenistic Age*, Cambridge: Cambridge University Press, 1986, pp.19–25). It could be argued that it was desirable for the peoples of his vast empire to have a recognizable depiction of their king, but such a conscious manipulation of one's image was quite new in Greek art, whether it stemmed from deliberate calculation on Alexander's part or merely excessive vanity. The canonical image of Alexander was taken over by his successors for propaganda purposes (see below), and the art of portraiture developed in the Hellenistic age into a major artistic genre, because the kings of the new Greek empires immediately appreciated the ways in which images of themselves could prove beneficial (see R.R.R. Smith, *Hellenistic Royal Portraits*, Oxford: Clarendon Press, 1988).

The personal empire that Alexander created in Asia was not the same as the Macedonian state. At the age of 20 the king had left his homeland under the control of the regent Antipater, with whom he had only sporadic contact for the next 11 years, and he died unexpectedly – never having returned home or secured the Macedonian succession with an heir – with only interim administrative arrangements in place for the vast eastern territories he had conquered. By the end, Alexander's entourage consisted not of an inner circle of nobles who had traditionally advised the king according to Macedonian custom, but of a group of self-made, ambitious generals whose position depended on their personal loyalty to Alexander himself. These men (the so-called "successors") were suddenly left leaderless in Babylon, and some 20 years of chaos ensued before the emergence of three relatively stable new empires, which form the focus of the "Hellenistic" history of the next three centuries.

It soon became clear that Alexander's empire could not survive intact under a single successor. Alexander's posthumous infant son Alexander and his half-witted half-brother Philip Arrhidaeus were declared joint kings, Alexander IV and Philip III. Their regent Antipater, who had been a general under Philip II, firmly resolved to take the kings home to Macedonia, thereby returning Macedon to its origins as a Balkan kingdom. This might have allowed the royal Argead dynasty of Macedonian kings (the family to which both Philip II and Alexander the Great belonged) to continue to rule in an unbroken bloodline in their European homeland, but both kings were soon murdered in the power struggles among the successors, as were,

eventually, all the immediate members of Alexander the Great's family. This signalled the extinction of the Argead line of Macedonian kings. Paradoxically, the political and personal influence of Alexander, the absent king, in his Macedonian homeland was far less important than that of his father Philip II had been, and it pales into insignificance when compared to his posthumous reputation and influence in the Asia he had opened up to the Greeks.

Since the sole uniting feature of Alexander's empire had been the king himself, various successors, who were eager to establish their own power in areas of Asia, sought to cloak themselves with the aura of Alexander's legacy in an effort to gain political legitimacy. Although none actually claimed to be Alexander's sole successor, attempts at "identification" with the late king proved a forceful propaganda tool in establishing the validity of their respective political power. Much of this imitation was achieved by the manipulation of royal iconography and the use of Alexander's image. For example, although Alexander himself never minted coins with his own portrait on them, shortly after his death some successors issued coinage with a highly idealized, almost divinized, head of Alexander adorned with subtly emotive attributes: the horns of Zeus Ammon (the oracular god whose shrine in the Egyptian desert Alexander had visited and with whom he felt a particular affinity for the rest of his life), the elephant-scalp headdress (which refers to his victories in India where he faced elephants in battle), and the royal diadem. These early portrait coins of Alexander clearly illustrate the potency of his image, but also directly influence the coinage of all his royal Hellenistic successors, which contains the head of the particular ruler and a selection of themes with propaganda value pertinent to the royal house in question (see Norman Davis and Colin M. Kraay, *The Hellenistic Kingdoms: Portrait Coins and History*, London: Thames and Hudson, 1973, plates 1–9).

The strength of Alexander's posthumous reputation as a tool of royal propaganda is seen most clearly in the kingdom of Ptolemaic Egypt (ruled by Alexander's former Macedonian general Ptolemy who subsequently declared himself king and founded a dynasty that ruled Egypt until the suicide of Cleopatra VII in 31 BC). Ptolemy hijacked the funeral cortège of Alexander while it was en route from Babylon, and brought his body to Egypt, eventually burying it in a magnificent tomb in his capital, Alexandria. By this devious act, Ptolemy became the guardian of the body of Alexander, which elevated his importance even as it linked him inextricably with the late king. The remains of Alexander and his magic belonged to Ptolemy. The tomb became the focus for the worship of Alexander (in Alexandria he was worshipped as the "founder God") and, later, of the royal cult of the Ptolemies

themselves (see below). The continuing importance of the tie of the Ptolemaic royal family with Alexander was graphically illustrated in a procession staged in Alexandria by Ptolemy I's son and heir, Ptolemy II Philadelphus. A major part of this procession honoured the Greek god Dionysus (from whom the Ptolemies claimed descent), and one important pageant depicted Dionysus as the returning conqueror of India. The parallel between the Indian victories of Dionysus and Alexander (who also features in the procession) was made explicit in the context of the procession, and the Ptolemies shared in the splendour of the eastern triumph as the heirs of Alexander and Dionysus (see E.E. Rice, *The Grand Procession of Ptolemy Philadelphus*, Oxford: Oxford University Press, 1983, pp.84 –86). In Egypt Alexander's image and posthumous reputation were deliberately used as powerful symbols of invincibility, divine connections, and the legitimate transfer of political power to the Ptolemaic royal house.

Alexander's views about his own divinity remain unclear because there is little evidence as to what he himself thought about it. He was not the first mortal to receive honours of a superhuman nature, but it appears that he was voted certain divine honours and welcomed them, even if he did not actually demand them. However this may be, the worship of Alexander was widespread in many parts of Greece and Asia after his death, as various cults, priests, dedications, etc., attested. This worship of Alexander clearly influenced the development of the ruler cults of the various Hellenistic monarchies, the deification of monarchs during their lifetime, and the civic cults established by Greek cities in honour of various kings, once the boundary between gods and men, and the honours appropriate to each, had become blurred. When the Romans came to dominate the Greek east, the establishment of the imperial Roman cult in this area can be seen as a natural progression of the acceptance of the worship of a human being (see S.R.F. Price, *Rituals and Power: The Roman Imperial Cult in Asia Minor*, Cambridge: Cambridge University Press, 1984).

A far more difficult issue is the question of Alexander's role in the Hellenization of the east. How far was Alexander himself responsible for the fact that, over the following several centuries, vast areas of Asia (comprising the Middle East, modern Turkey, Iran, Iraq, and parts of Afghanistan and Pakistan as far as India) became urbanized, populated by Greeks living in harmony with native peoples and remaining largely Greek-speaking, even after many of these territories were incorporated into the Roman empire? Alexander is often regarded as one of the greatest city-founders of all times. His cities were mostly named "Alexandria" (the transliterated form of the name in Greek), and stretched from Alexandria in Egypt at the southwest tip

of his empire to Alexandria Eschate (“the Furthest”) on the Jaxartes river (modern Syr Darya) in Central Asia in the extreme northeast of it. It has often been claimed that these Alexander-foundations were responsible for spreading the light of Greek civilization throughout barbarian Asia, but the truth is impossible to ascertain. The ancient sources differ widely about the number (from very few to very many) and locations of his city foundations, as well as their nature. Some, we are told, were cities in the proper sense: permanent settlements with civic institutions and buildings in the Greek style. Others appear to have been fortified military settlements sited at strategic geographical points, and yet others outlying guard posts established as needed to control the surrounding area. There is no evidence for Alexander’s reasons for founding cities – if indeed he had a well-thought-out policy in so doing beyond a general preference for civic life – although the rationale behind those that had a military or strategic importance seems obvious enough. In the few cases where we are told of its composition, the population was a mixture of time-expired Macedonian veterans, Greek mercenaries, and local inhabitants who volunteered to settle there. It is no coincidence that very few Alexandrias known from literary sources have been identified on the ground. In the first place, the pattern of life in Central Asia was essentially nomadic, not accustomed to urbanization. Furthermore, the artificially gathered population was an unhappy mix of peoples (many of them thousands of miles from home and probably longing to return) who had no natural affinity with each other. Many Alexandrias probably soon died out from lack of interest, starvation, internal warfare due to ethnic tensions, or migratory invasions from outside, leaving no identifiable archaeological remains. Other Alexandrias may have been refounded and renamed by Alexander’s successors, leaving no clue as to their original foundation.

Given the above considerations, the conclusion must be that Alexander’s ephemeral cities themselves can have hardly caused the east to be Hellenized as it was to become in the Seleucid and Graeco-Roman period. The sense in which Alexander can indeed be said to be ultimately responsible for the spread of Hellenic culture in this region is that it was he who opened up the east geographically to the west and created the possibility of Graeco-Macedonian domination there, even though he did not live long enough himself to see it permanently pacified and administered by a ruling class of his creation. The eventual results of Alexander’s actions, therefore, must not be confused with his irrecoverable intentions at the time, since it was left to his successors to carry out their own schemes of urbanization and Hellenization.

Finally, Alexander’s achievements and extraordinary fame

contributed in an unexpected way to the development of ancient Greek literature and, through it, to the development of medieval and modern literature. Many histories of Alexander were written in antiquity, from contemporary eyewitness accounts of the campaigns to works by writers who lived hundreds of years later. The former survive only by title or in quotation by the latter, who drew upon these first-hand accounts as well as on a large body of popular tales that quickly grew up about a figure as world-famous as the great Macedonian conqueror. None the less, these serious histories of Alexander – however important they undoubtedly are to our understanding of Greek historiography – share the stage with a work of a type that has more in common with the ancient novel, namely the romance, a genre of Greek literature that was increasingly popular in the Hellenistic and Graeco-Roman periods.

The so-called *Alexander Romance* is a fascinating “pseudo-historical” source for Alexander the Great. It is a fictitious account of Alexander’s exploits based loosely on the historical record, combining several different sources into the main Greek version which has come down to us (it was falsely assigned to Alexander’s official historian Callisthenes – hence its frequent attribution in modern literature to pseudo-Callisthenes). Scholars have argued that the *Alexander Romance* dates in its present form from the 3rd century AD (although it incorporates older elements), and that various identifiable strands in it include a fictitious biography of Alexander, an epistolary novel of Alexander’s supposed letters, and set-piece descriptions of marvels (see Tomas Hägg, *The Novel in Antiquity*, Oxford: Blackwell, 1983, pp.125ff.). However this may be, the *Alexander Romance* was a hugely popular and influential work, and the vehicle by which a version of Alexander’s deeds passed into several different cultures. There was a Byzantine metrical version of the *Romance*, and it was translated in the Middle Ages into some 35 different languages, among them Latin, Syriac, Arabic, Armenian, Hebrew, Ethiopic, and Hungarian. The Alexander of the *Romance* and his amazing exploits became one of the most popular heroes in the medieval Ottoman Karagöz shadow-puppet theatre, and can still be seen today in its modern Greek equivalent, the Karaghiozis puppet theatre.

Biography

Born in 356 BC, the son of Philip II and Olympias, Alexander was a pupil of Aristotle. He fought at Chaeronea in 338 and succeeded to the throne of Macedon on his father’s death in 336. Having established himself a master of the Greek world, he crossed the

Hellespont in 334 with a huge army to conquer the Persian empire. He died on his return, at Babylon in 323 BC. His military exploits and early death ensured his immortality in the Hellenic tradition.

Alexandria

City in Egypt

At the time of Alexander the Great's invasion of Asia, Egypt had been, intermittently, a remote part of the Persian empire since 526/25 BC when the Great King Cambyses invaded and conquered the country. Persian rule appears to have been harsh during the 4th century, with the result that Alexander was welcomed by the Egyptian populace to whom another foreign conqueror was welcome if it meant the end of hated Persian rule. Alexander entered Egypt from Gaza, and paid his respects at the inland dynastic capital Memphis (south of Cairo) before sailing north along the Nile via the western branch of its delta to the

Mediterranean coast, to a small native town called Rhakotis.

There, in 331 BC, Alexander made the first, and indisputably the greatest, of his city foundations, and named it “Alexandria” (in Greek) after himself. The ancient literary sources give us a romantic picture of the young Alexander appreciating the suitability of the site and taking a personal interest in the design of the city, pacing out the line of the city walls and marking the location for various structures inside. However this may be, the coastal site of Alexandria was a magnificent choice for a city, facing on to the Mediterranean, endowed with good natural harbours, and with easy access to the interior of Egypt through the river system. It may be that local Greek traders in the region (Greeks had been settled at the inland delta city of Naucratis since the 7th century BC) persuaded Alexander of the site’s potential, or perhaps Alexander – with a view to his posterity – just acted upon a suggestion that was attractively presented to him. The actual design of the new city was left to Deinocrates, a Macedonian town planner/architect in Alexander’s entourage.

Alexander left Egypt and continued his expedition to the east, leaving Alexandria under the control of an appointed financial administrator, Cleomenes of Naucratis. Alexandria seems to have functioned as a Greek polis from shortly after its foundation. When Alexander died in 323 BC, the territory which he had conquered was divided up among his successors for the purposes of administration. The satrapy of Egypt was assigned to Ptolemy son of Lagus, a Macedonian boyhood friend of Alexander who served as a general during the eastern expedition, and it remained firmly in his hands throughout all the struggles of the successors. Cleomenes had proved to be notoriously corrupt in his dealings with the grain trade. After Ptolemy arrived in Alexandria, he made Cleomenes subordinate to him and eventually had him killed. When, in line with the other successors, Ptolemy declared himself a “king” in 305/04 BC, Alexandria became the capital city of his new kingdom, and it remained the capital of the Ptolemaic empire throughout the course of its existence.

During the reigns of Ptolemy I and his son Ptolemy II Philadelphus, Alexandria developed into a great city which became the jewel of the Mediterranean, taking over from Athens as the commercial and cultural capital of the Greek world. Immigrants were recruited from all over the Greek world to settle in the new city, and soon there evolved a mixed population of Greeks, native Egyptians, Jews, and other ethnic groups. To the first Ptolemies must be attributed the developed layout of the city (based on a grid plan around two main intersecting thoroughfares running the length of the ancient city) and the construction of its most famous features. (The best ancient description of the city is found in book 17 of the geographer Strabo,

who visited Alexandria in 24 BC.) Knowledge of ancient Alexandria is limited both because the ancient city has been continuously inhabited and built over, and because the shoreline has sunk several metres since antiquity, submerging large areas of the original city.

The great Pharos, or Lighthouse, of Alexandria was constructed in the eastern harbour, perhaps on the site of an earlier beacon, on the small offshore island of Pharos (whence the lighthouse takes its name) which in antiquity was connected to the mainland by a causeway. The site is occupied today by the 15th-century fort of the Sultan Qait Bey. The Pharos is described by many ancient authors and is depicted on coins of the Roman period. It was the latest construction to be reckoned as one of the seven wonders of the ancient world. An inscription attests the involvement of Sostratus of Cnidus, but whether as architect or dedicator is unknown. Recent underwater excavations near the fort have revealed major remains from the structure.

The main royal complex of the Ptolemies was a huge area known as “the palaces”, comprising several major buildings. Its location was thought to be in the area of the Lochias promontory, approximately the site of the smaller modern headland Silsileh on the eastern side of the east harbour, and this has been confirmed by exciting new underwater excavations west of Silsileh. Finds apparently from the palaces have been recovered but they are still being studied. The royal residences of the Ptolemies would undoubtedly have been grand and luxurious, reflecting their acclaimed wealth, but the palaces contained other structures which housed institutions credited with the preservation and dissemination of Greek culture.

The Museum (in Greek *Mouseion* – Shrine of the Muses) was founded probably by Ptolemy I as a complex of residential blocks and study facilities for scholars. Attached to it was the famous Library of Alexandria, founded originally in imitation of the library in Athens but soon eclipsing it in size and fame (ancient sources mention some 490,000 papyrus rolls). The librarian was appointed directly by the king and held the post for life. The library was responsible for the codification, copying, and therefore preservation of much of Greek literature, and attached to the museum and library were some of the greatest Greek scholars and writers of their day from all over the Greek world, many specially invited to Alexandria by the king: the 3rd-century BC poets Callimachus, Theocritus, Lycophron, and Apollonius Rhodius, the mathematician Euclid, the astronomer and geographer Eratosthenes of Cyrene, the grammarian Aristophanes of Byzantium, the 2nd-century AD geographer Claudius Ptolemy, to name but a few. It was an irreparable loss that the library was accidentally burnt in 48 BC during Julius Caesar’s “Alexandrian War”. A second large library was attached to the temple of Sarapis (or “Sarapeum”) in

the southern part of ancient Alexandria.

The Greek translation of the Hebrew Old Testament, the so-called Septuagint, was made at Alexandria. Tradition maintains that King Ptolemy II summoned the greatest Jewish scholars of the day to his city, and entertained them while the translation was made. It may rather have been at the behest of the Hellenized Jewish community whose knowledge of Hebrew was decreasing to the point that they could no longer read their holy books in their original language.

Alexandria's fame was furthermore ensured by the burial there of Alexander the Great. His funeral cortege from Babylon was diverted by Ptolemy I to Egypt, and his body first buried in the dynastic capital Memphis before being transferred to a grand tomb (in Greek the "Sema" or "Soma") in or near the palaces area in Alexandria. The various chronological stages of construction for this tomb are uncertain due to varying literary tradition, but, in time, the Ptolemies themselves were buried there and the Sema became the focus of the cult of Alexander and the ruler cult of the Ptolemies. The original gold sarcophagus is said to have been replaced later by an alabaster one, and it is attested that the 3rd-century AD Roman emperor Caracalla gazed upon the embalmed Alexander.

Throughout the centuries of Ptolemaic rule in Egypt, Alexandria remained their capital, and, so far as we can tell, primarily a Greek city, although Egyptian architectural and decorative elements can be seen, especially in the extensive necropolis areas with their rock-cut chamber tombs designed for multiple burials. In common with the other Hellenistic kingdoms, Alexandria came to the attention of Rome, and by the 1st century BC became involved in the Roman civil wars. It is well known that the last Ptolemaic queen, Cleopatra, had a liaison with Julius Caesar, and a renowned love affair with Mark Antony. Their naval defeat at Actium at the hands of Octavian (later the emperor Augustus) led to the suicides of both Antony and Cleopatra.

After the death of Queen Cleopatra VII in 31 BC the Ptolemaic dynasty came to an end and Egypt became a province of the Roman empire. Alexandria continued to flourish due to its advantageous location for east-west trade, and became the second largest city of the empire. For the first three centuries AD massive freighters carrying the Egyptian grain which fed the population of Rome set out on their journeys from Alexandria every spring. Alexandria continued as a centre of learning. It was the home of the Neoplatonist school of philosophy, whose most influential member was the 3rd-century AD scholar Plotinus, who studied in Alexandria for a time. The school remained active until the 6th century AD, and influenced later Byzantine Greek thought, among much else. A great corpus of commentaries on the famous 4th-century BC Greek philosopher

Aristotle was produced by the Alexandrian school.

This pagan tradition existed alongside Christianity, which came early to Alexandria. The evangelist St Mark is reputed to have come to Alexandria in the 1st century AD, to have been its first bishop, and to have been martyred there. Alexandria became one of the main centres of the Christian Church in the first centuries of its existence.

Alphabet

The ancient Greeks can be credited with providing humankind with the first fully alphabetic writing system – an intellectual achievement and technological leap of no mean significance. As is almost universally the case with such advances, the Greek alphabet was built upon a previously existing model – in this case, the consonantal script of speakers of a west Semitic language. Herodotus gives the credit to Cadmus and his fellow Phoenicians who had come to Greece in search of the abducted princess Europa:

And these Phoenicians who had come with Cadmus ... and settled this country brought to the Greeks, among many other arts, the letters – which, I believe, were not previously known to the Greeks. Eventually they changed the sound and the shape of the letters. In this time, it was mostly Ionian Greeks living around the Phoenicians, who, having learned the letters from them, used these, making a few changes in their shape. The Greeks still called the letters “Phoenician”, as was right, since the Phoenicians had brought them to Greece (Herodotus, 5. 58–61)

Modern scholarship has been almost unanimous in its agreement with Herodotus regarding the Phoenician source of the alphabet.

Herodotus was probably also accurate in envisioning that the Greek adaptation of the Semitic consonantal script took place in a setting in which Greeks and Phoenicians lived in close proximity to one another. Beyond that, the Greek alphabet may have made its first appearance in the Aegean among the West Ionic speakers of Euboea, bordering upon the region of Boeotia in which Cadmus is reported to have settled. The actual Greek acquisition of the Phoenician script, however, probably took place in some other locale and somewhat later than the date in the 2nd millennium BC in which Herodotus' Cadmus would have arrived in Greece.

Prominent among those places that have been proposed for the Greek adaptation of the Semitic writing system are Crete, Rhodes, Al Mina, and Cyprus. Of these, the most compelling candidate (on both linguistic and non-linguistic grounds) appears to be Cyprus, where literate Greeks writing with a syllabic script (the Cypriot Syllabary) lived side-by-side with Phoenicians using their consonantal script. The probable date of adaptation is the early 8th century BC (or possibly even the late 9th century BC).

The Phoenician script, like other West Semitic writing systems of antiquity, consists only of characters for consonants; vowels are not directly represented in Phoenician orthography. Since the Phoenician language possesses several consonants not occurring in Greek, the Greek adapters of the Phoenician script had at their disposal several superfluous consonantal symbols. These they converted to vowel characters: Phoenician *aleph*, representing a glottal stop, was adopted as a symbol for the vowel *a*, that is *alpha* (Α); Phoenician *he*, the symbol for *h*, became Greek *epsilon* (Ε), spelling *e*; *'ayin*, symbol for the Phoenician voiced pharyngeal fricative, was taken over as *omicron* (Ο), representing Greek *o*; *yod*, the character for *y*, became Greek *iota* (Ι), used to spell *i*; and Phoenician *waw*, *w*, came to be used for spelling the Greek vowel *u* – the letter *upsilon* (Υ), as well as being used for the consonantal character called *digamma* (Ϝ), representing *w*). In

this way, those Greeks who adapted the Phoenician script for their own use created the first writing system to represent systematically both individual consonant and vowel sounds.

In time, two additional vowel characters appeared in the Greek alphabet. The Phoenician letter *Het*, representing a voiceless pharyngeal fricative, was first used for Greek *h*. The consonant *h* did not, however, occur in certain dialects of Greek (such as Cretan and East Ionic); in these, the Greek symbol derived from *Het*, that is *eta* (Η), came to be used to represent a long vowel *R*. In parallel fashion an additional vowel character was created (being derived from the symbol *omicron*) in order to represent the distinct long vowel *ō* – the character *omega* (Ω) – and was appended to the very end of the alphabet. Prior to these developments, *epsilon* and *omicron* had been used for representing both short and long *e* and *o* respectively.

The Greek adapters of the Phoenician script included in their alphabet two different characters representing *s*-sounds. One of these stands in the alphabetic position of the Phoenician letter *sade* (representing a so-called emphatic fricative or affricate, a consonantal sound characteristic of Semitic languages), the other in the position of Phoenician *shan* (Hebrew *shin*, symbol for *sh*). The former of these corresponds to the Greek letter commonly called *san* (Σ), the latter to that called *sigma* (σ). The inclusion of both in the early Greek alphabet suggests that the Greek dialect of the adapters was one in which two distinct *s*-type sounds occurred – a picture consistent with a Cypriot origin of the alphabet. Most Greek dialects had only a single *s*-sound, however, so that the various local, or epichoric, varieties of the Greek alphabet that developed as the script spread across the Greek-speaking regions retained only one of these two symbols.

The name of the character *sigma* is certainly secondary, not continuing a Phoenician letter name (though the contrary claim has been made), and was derived from the Greek root *sig* -, seen in the verb *sizo* (“I hiss”), having an earlier stem **sigyo-*. Herodotus (1. 139) writes that among some Greeks the character *sigma* is itself given the name *san*, and this is also the name by which the latter is commonly denoted in Greek poetry. In all likelihood, *san* was the early Greek name of the *sigma*-character (σ) and simply continues the name of the corresponding Phoenician letter, *shan*. The original Greek name of that non-*sigma* *s*-character, the one more commonly called *san* (Σ, corresponding to Phoenician *sade*) is thus unknown, the name *san* having become affiliated with it in those epichoric alphabets from which the *sigma*-character was excised.

Also noteworthy is the inclusion in the early Greek alphabet of two double-consonant characters (i.e. letters that represent a sequence of two individual consonants). The letters in question are Greek *zeta* (Ζ)

and *xi* (Ξ). *Zeta* represents the sequence *zd* (having become *z* in modern Greek) and corresponds to the Phoenician letter *zayin* (symbol for *z*); while *xi* was assigned the value of *ks* by the Greek adapters, and is derived from the Phoenician symbol *samek* (representing *s*, though perhaps earlier with a value such as *ky*). The presence of these symbols in the early Greek alphabet is a curious matter, given that they are completely redundant; in other words, the consonant sequences that they represent could have been written using two individual consonant letters. Thus, the sound sequence of *zeta*, for instance, could have been spelt *sd* (*sigma* (Σ) + *delta* (Δ)); in accordance with Greek phonetic structure, in this context *sigma* would automatically have the voiced value *z*; and, similarly, the sound sequence of *xi* could have been spelt *ks* (*kappa* (Κ) + *sigma* (Σ)). The incorporation of these characters in the alphabet again points to Cyprus as the place of adaptation, where similar biconsonantal symbols are properly accounted for within the structure of the Cypriot Syllabary.

In addition to the Greek letters that the adapters derived from corresponding Phoenician characters, and to the vowel letter *omega*, added to the end of the alphabet, certain of the local Greek alphabets are characterized by the presence of three additional letters, immediately preceding *omega*. These are the so-called “supplementals”, having no formal Phoenician counterparts. One of these supplementals is the letter *phi*, representing an aspirated stop *ph* (which later becomes the fricative *f*). The second is *chi*, spelling an aspirated velar stop *kh* (later a velar fricative, often transcribed *ch*). The third is yet another biconsonantal character; in this case one representing the sequence *ps*, namely *psi*. As will be seen below, however, different values are in some places attached to these two last-named letters.

The numerous regional forms of the alphabet that developed among the ancient Greeks can be subdivided into three fundamental types on the basis of these supplemental characters. To begin with, there are some epichoric alphabets that lack the supplementals. These are the so-called “primitive” scripts of Crete, Thera, and Melos (also called the “green” scripts, after the colour-coded map of Greek alphabets which was included in Kirchhoff, 1867, most recently republished in 1973). In those alphabets that do include the supplemental characters, the letter *phi* (Φ) appears everywhere with the value *ph*. Differences occur, however, in regard to the remaining two supplementals.

In the “blue” alphabets (again, so called after Kirchhoff’s map) *chi* appears as C, representing *kh*; and *psi* (Ψ) has the value *ps*. Among a subset of blue alphabets, however, the supplemental *psi* does not occur (and *ps* is spelt with two letters: *phi* + *sigma*; in the same way these

alphabets lack the Phoenician-based biconsonantal letter *xi* (Ξ), and spell *ks* as *chi* + *sigma*). The blue alphabets lacking *psi* have been dubbed “light blue”, the remainder “dark blue”. Light blue alphabets were used, for example, in Attica and on some of the Aegean Ionic islands; Corinth, Mycenae, and the Ionic cities of Asia Minor, among other places, used the dark blue alphabet.

A large number of regional alphabets show yet a different configuration with regard to the supplemental characters; these are the so-called “red” alphabets. Here the symbol X (blue *chi*) represents not *kh*, but the sequence *ks* (and the Phoenician-based Ξ, representing *ks* in dark blue alphabets, does not occur). Moreover, the symbol Ψ in the red alphabets does not spell *ps*, as in the dark blue alphabets, but is used to represent *kh* (and there is no single symbol for *ps*). The order of the supplementals in the red alphabets is X (*ks*), Φ (*ph*), Ψ (*kh*), versus dark blue Φ (*ph*), X (*kh*), Ψ (*ps*). Among those places using red alphabets were Euboea (and its colonies), Boeotia, and Thessaly.

In 403 BC the Ionic alphabet (a dark blue script) was adopted by Athens as its official alphabet. Within a few decades, this Attic alphabet had spread throughout the Greek-speaking world and replaced most of the regional varieties. Beyond being the ancestor of the modern Greek alphabet, this script would have great influence on the development of writing in Europe, and beyond.

St Cyril and St Methodios, accompanied by other Greek missionaries, set out in the 9th century AD to bring Christianity to the Slavs. As a part of their evangelistic efforts, and on the basis of their own Greek alphabet, the saints developed two alphabetic writing systems with which the Bible could be translated and recorded in the Slavic language of their converts (Old Church Slavonic). One of the scripts, Glagolitic, would survive only in limited usage, but the other, Cyrillic, would give rise to the writing systems of numerous different Slavic peoples – Russian, Ukrainian, Serbian, Bulgarian. The Russian Cyrillic alphabet would in turn be adapted for writing various non-Slavic languages of Eurasia. The alphabetic scripts which, by tradition, St Mesrop designed for writing Armenian and Georgian (5th century AD), though perhaps of mixed heritage, were also clearly fundamentally based on the Greek alphabet.

It was a Greek alphabet of Magna Graecia, of the red variety, that was acquired by the Etruscans in the 7th century BC. This in turn was transmitted to various peoples of the Italian peninsula, most significantly to the Romans. The Roman alphabet probably inspired the development of the Runic scripts of the Germanic peoples of Europe (and perhaps the curious Celtic Ogham script as well), but, more importantly, was spread to Europe itself, both by Roman armies and, in time, by the Roman Catholic Church. Acquired as the writing

system of English and other languages of Europe, it would be spread around the globe. In the final analysis, all alphabetic writing systems in use today have their origin in the Greek alphabet, with the exception of the Han'gul script of Korean.

Altars

Altars of one kind or another have been employed continuously from a very early period in Greek history, but the two contrasting dictionary definitions, a "flat-topped block for sacrifice or offerings to a deity" and a "communion table" point to significant discontinuity.

Prehistoric altars could be portable ("tables of offering") or permanent. The latter include rough stones (Mycenae), bench altars (Knossos, Mycenae, Kea, Phylakopi, Tiryns), and some freestanding structures. Of the last, one, apparently used for human sacrifice, comes from Middle Minoan Crete (Anemospilia, Archanes), another stands in the central court at Phaestus, and a further example is

represented in the frescos of Xeste 3 at Akrotiri on Thera. In Early Bronze Age Crete stone-built altars are associated with tombs. Sometimes (sanctuary of Apollo Maleatas, Epidauros, prehistoric phase) altars were formed of the gradually accumulated debris of offerings, whether of sacrificial animals or material gifts, deposited on a sacred spot. By the Archaic period altars were often regular in shape, frequently made of ashlar masonry and with some architectural decoration (e.g. volutes, mouldings, friezes: Cape Monodendri, Miletus).

The most prominent altar type of later antiquity (including the Classical period) was the built *bomos* (platform altar), sometimes an isolated structure, but normally associated with a temple and standing outside its eastern front. On this sacrificial victims were burned. Altars were still sometimes (altar of Zeus at Olympia) composed of debris. From the Hellenistic period some public altars were enclosed by huge, monumental structures and bore extensive sculptural decoration (Great Altar of Zeus at Pergamum). Heroes and chthonic deities, as distinct from the Olympian gods, had a ground altar (*eschara*) which allowed wine and blood to soak into the earth, their natural home.

Smaller private altars, domestic or funerary in function, and of various shapes, are also found. Funerary altars, often round and decorated with garlands and bucrania (the decoration refers to the garlanding of sacrificial animals) are common only in later periods, especially the Roman. Not all offerings were sacrificial: wine, cakes, etc. might be appropriate, according to the occasion, and were more commonly offered on the smaller altars.

In Christian practice the altar originally connoted the table (*iera trapeza*, “holy table”) of the Last Supper and was the location of its ritual re-enactment in the liturgy. Later it acquired a variety of symbolic connotations (e.g. Christ’s tomb). The first Christian altars (up to the 4th century AD) were mostly small, wooden, and portable. One later type is simply a translation of this into stone. The solid rectangular stone form that became most common may be derived from the tombs of the martyrs, where it was customary to celebrate the Eucharist, in commemoration of their sacrifice. Also connected with this custom was the practice of containing relics of the martyrs within the altar, or in a crypt beneath.

In Christian times the altar continued to be closely associated with the chief sacred building – the church – though now it was situated inside. The interior location allowed it to be adorned with coverings, and to carry symbols permanently (crosses, candlesticks, etc.), although this development did not occur before the 10th century AD. Often an elaborate canopy (ciborium) was raised over the altar.

In spite of the evidence for some degree of overlap between the

pagan and Christian traditions (e.g. in the use of sanctuary sites, iconography), and the possibility that pagan altar structures had some influence on Christian types, there is no evidence for either material or ideological continuity in the case of altars. The former, in any case, would surely have been offensive to Christians. Nevertheless, as the idea of sacrifice inherent in the death of Christ and commemorated in the liturgy became more prominent in Christian thought, there was some convergence of the two traditions, although in Christian practice the sacrifice at the altar is symbolic.

Amasis

Potter and painter of the 6th century BC

The potter Amasis first became known when a vase (560 BC) signed with his name *Amasis me poiesen*, ("Amasis made me") was found at Vulci in 1828. In all, eight black-figure vases bearing his signature are known, and their decoration has often been attributed to a single painter known as the Amasis Painter. Amasis' other work as a potter consists of two vases for Lydos and a cup decorated by a red-figure painter. His earliest signature as a painter occurs on a fragmentary band-cup of around 550 BC.

The name Amasis is a Hellenized form of the common Egyptian name A-ahmes. This has resulted in much scholarly debate as to the potter's origins. It has been suggested either that Amasis was an Athenian named after the Egyptian king Amasis (Ahmosis) or that he was not Athenian by birth and that his name was adopted in Ionia or after he came to Athens. Those who support the former hypothesis

argue that the potter and the painter are different men; according to the latter view, the potter and painter are identified as the same person.

The Amasis Painter decorated a wide range of shapes – such as belly- and neck-amphorae, *oinochoae* (wine jugs), cups, *lekythoi* (oil flasks), an *alabastron* (perfume vase), an *aryballos* (oil flask), and a tripod *pyxis* (box), as well as small and large plaques. He did not, however, restrict himself to standard types of vases, but explored different variations of certain shapes, as, for example, the cups and the neck amphorae.

The style of the Amasis Painter is usually considered conservative because, even when he adopted new conventions, he did not abandon established forms. The precision of drawing and the ability to work on different scales seem the main characteristics of his work. He also paid attention to the harmony between the shape of the vase and its decoration, as seen on the panel amphorae he decorated.

In the early stages of his career his style reflected the work of the Heidelberg Painter and of the Siana cup painters. From the former he adopted stately processions, garments with fringes, and certain conventions for the rendering of anatomical details, while the latter probably inspired him to adapt a procession of horsemen to panel-amphorae. Moreover, the influence of Cleitias may be seen in his miniature style. The Amasis Painter also shared a number of features with Lydos, such as the preference for symmetry in his compositions as well as certain details in drawing. Although he used the common black-figure floral ornaments above the panels of his scenes, he reinforced the frames by more than one glaze lines, and a vertical band of meander or chevrons. He used bands of upright buds or palmette and lotus to decorate the area above the panels on amphorae.

In the late phase of his career, instead of foldless drapery, he painted flat, angular folds, and women's flesh was drawn in outline, not white on black, the standard convention of his time. Other characteristics of his work include a change in the ornament framing his compositions – the lotuses lose their central leaf – and the occasional omission of the ground line for his figures. The Amasis Painter demonstrated a great interest in the representation of jewellery and armour, especially of shield devices, as well as of architectural elements (fountain houses, column shafts, and a distyle *in antis*), which offered opportunities to represent spatial depths. He often used stippling for the hairy bodies of the satyrs, figures who had features in common with those drawn by Lydos, and for head-hair and beards. The growing understanding of the human body was reflected in his figures, which gesticulated expressively.

The Amasis Painter decorated vases with a wide repertoire of scenes that extend from the Olympian gods and heroes to daily life in Athens and the Attic countryside. Although several of his figures are labelled with painted inscriptions, the scenes are not always easily recognizable. He prefers to fill out his scenes with figures that either participate in the action or act as mere spectators; only occasionally did he concentrate on just the essential elements of the subject. Dionysus is one of his favourite characters, standing between satyrs, maenads, and mortals or supervising the vintage; the hero Heracles is represented being received on Mount Olympus after his death. His mythological scenes are well composed but rarely show the originality of his representation of the divine stables. The Amasis Painter was one of the first to introduce complex everyday scenes on vases – such as a wedding procession, the fullest early pictorial account of an Attic wedding – women at various stages of wool working and weaving, a hunter's return, and a cavalcade. He also demonstrated a consistent inclination to blur the lines between the realms of mortals and immortals or to combine the two.

The vases decorated by the Amasis Painter were widely distributed in the ancient world, as is also the case with other Attic potters and painters: in south Russia (Berezan), Italy and Sicily (Cumae, Capua, Gravisca, Vulci, Orvieto, Chiusi, Cerveteri, and Selinus), North Africa (Naucratis, Cyrene), Cyprus, and Greece (Athens, Eleusis, Tanagra, Perachora, Kavalla, Rhodes, Samos, Delos). Surviving signed works are now held in various museums around the world, including the Museo Gregoriano Etrusco in the Vatican, the Museum of Fine Arts in Boston, the British Museum in London, the Louvre and the Cabinet des Medailles of the Bibliothèque Nationale in Paris, the Martin von Wagner Museum at Würzburg University, and the Getty Museum in Malibu.

Biography

Name of a potter and painter of the 6th century BC. He may have been an Athenian named after the Egyptian king Ahmosis; or he may have come to Athens from elsewhere and acquired the name in Ionia. If the former, potter and painter are assumed to be two different men; if the latter, they are one. As potter Amasis signed eight black-figure vases, two other vases, and a cup. The Amasis Painter painted a wide range of scenes on a wide variety of vase shapes.

Amphipolis

City in Thrace

The Athenians and their allies under the general Hagnon, son of Nicias, founded Amphipolis in 437/36 BC on the site of the earlier Thracian city of Ennea Odoi (“Nine Ways”). According to Thucydides (4. 102) Hagnon named it Amphipolis because the river Strymon flowed on each side of the city. It was inhabited by a mixed Greek population, including many Ionian settlers from neighbouring cities, and controlled the rich Strymon basin and its hinterland.

Early in the Peloponnesian War (424 BC) it surrendered to the Spartan general Brasidas; two years later Cleon’s unsuccessful expedition to recover it ended with his own death as well as Brasidas’ in the battle of Amphipolis (422 BC). Although in the Peace of Nicias (421 BC) there was a special provision for Amphipolis’s restoration to Athens, Athenian operations in the region, which did not cease until the time of Philip II of Macedon, indicate that the city was not totally under Athenian control.

The economy of Amphipolis did not depend solely on the rural population which cultivated the Strymon valley, but also on merchants and craftsmen. The city’s prosperity is reflected in a lavish series of coins after the Peace of Nicias. Inscriptions provide information about the administrative organization of the city, and the ways in which it controlled trade and protected the life and property of its citizens through its institutions and special officials.

In 357 BC Philip II conquered Amphipolis and established a Macedonian garrison. The city became a royal mint as well as the base for Macedonian operations to the east of the Strymon. In 334 BC the fleet of Alexander the Great set sail on its Asiatic campaign from the harbour of Amphipolis. Moreover, the importance of the city at this period is indicated by Alexander’s decision to make Amphipolis one of the six major cult centres of his empire – the others being Delos, Delphi, Dodona, Dion, and Kyrros – and to build a magnificent temple of Artemis Tauropolos, a plan which was never realized.

After Alexander’s death his mother Olympias issued a decree by which the garrison of Amphipolis was given to Cassander. It was here

that Alexander's wife Roxane and his son and heir Alexander IV were exiled. The strategic location of the city, commanding the bridge over the Strymon, and its hinter-land, rich in agricultural products, precious metals (gold and silver), and timber, ensured its prosperity into Hellenistic and Roman times and it became a strong military, economic, and cosmopolitan centre.

Although archaeological surveys in the area of Amphipolis were undertaken in the 19th century, it was not until 1956 that systematic excavations commenced, bringing important finds to light. A large part of the Classical city wall was revealed. Seven gates provided access to the city, while round towers in elevated positions along the wall controlled all movements on both the east and west banks of the river. The largest and strongest gate was the so-called Bridge Gate, mentioned by Thucydides (4. 103, 108) in connection with the battle between Cleon and Brasidas in 422 BC. The fortifications of the city underwent repeated repairs in Roman and Byzantine times.

In addition to the city walls, an inner fortification wall encircled the acropolis of Amphipolis, which was located on a hill at the most prominent part of the site. At the west end of the acropolis and inside its Classical enceinte, a house of the 4th century BC was excavated, indicating the existence of a Classical suburb in this area, which continued to be inhabited in the Hellenistic period. Moreover, a Hellenistic house of the 2nd century BC with painted walls recalling the First Pompeian style was found in the south sector of Amphipolis.

The first large public building to be identified from epi-graphic evidence was the gymnasium. It was located in the southeast sector of the city, between the inner and the outer walls, and next to a narrow water channel, indispensable to the function of the building. It was built by the Hellenistic period and remained in use until the early imperial period, when it was probably destroyed by a fire. An important inscription of the 1st century BC provides information about the education of youths, the society of Amphipolis, and its topography, mentioning an agora, workshops, a road network, and a theatre.

The cult of the king of Thrace, Rhesus, son of Eion and Cleio, already attested in Homer, is the earliest known cult at Amphipolis. In addition, there are sanctuaries of the muse Clio (first half of 4th century BC), of Attis, and a Thesmophorion or Nymphaeum (5th century BC) outside the north city wall, and an open-air structure with niches for the cult of Attis and Cybele, which became popular in Hellenistic and Roman times.

Classical and Hellenistic cemeteries have been discovered outside the city walls. Numerous graves of various types have yielded a vast quantity of grave offerings, such as gold jewellery, terracotta

figurines, pottery, bronze objects, and grave stelae. An impressive example of burial sculpture of the 4th century ^{BC} is the Monument of the Lion, on the west side of the river Strymon. It was set up in honour of an Amphipolitan citizen, probably Laomedon, one of Alexander's admirals. Today it stands restored on a high podium at the spot where it was found.

After the battle of Pydna (168 ^{BC}) Amphipolis became the capital of one of the four administrative districts (*merides*) into which Macedonia was divided by the Romans in order to achieve the break-up of its political unity. Although in the mid-1st century ^{BC} Amphipolis suffered invasions by Thracian tribes, which resulted in the destruction of its buildings, both the ancient literary sources and the archaeological evidence reveal that the city flourished as a commercial and artistic centre as well as a mint down to the final years of the Roman empire. With the support of Roman emperors, especially Augustus and Hadrian, Amphipolis remained one of the most important urban centres in Macedonia, as is reflected in its monumental buildings with mosaic floors and mural paintings.

Anatolia

In geographical terms Anatolia (otherwise Asia Minor) occupies the territory of Turkey between the Aegean Sea and the Euphrates river. The western and southern coastal areas were part of the Mediterranean world. In the Graeco-Roman period several regions existed within Anatolia, corresponding to separate languages, cultures, and religious beliefs: Bithynia, Cilicia, Cappadocia, Galatia, Paphlagonia, and Pontus.

Anatolia has always been a crossroads of different peoples and cultures, and it was dominated at different times by different political

and cultural entities. The Hittite empire was the major power in Anatolia in the Late Bronze Age but its collapse in c.1200 BC allowed new cultures to rise. At the beginning of the Iron Age neo-Hittite states were established in the southeast, and at the turn of the 9th century BC the Urartians emerged as a leading power in the east and northeast of the region. Both the Hittites and Urartians frequently clashed with their Assyrian neighbours. However, political difficulties in Anatolia never prevented close cultural contacts and the exchange of artistic ideas.

Greeks from mainland Greece started to settle the western shores of Anatolia and the offshore islands from about the 11th century BC onwards. Aeolians founded cities between the Troad and the gulf of Smyrna; the Dorians established six major cities in Caria and on the islands of Rhodes and Cos. The Ionians, who arrived in much greater numbers than either of these, established themselves between the two. The culture created together by these three peoples is known as East Greek. The 12 Ionian cities – Chios, Samos, Phocaea, Clazomenae, Erythrae, Teos, Lebedos, Colophon, Ephesus, Priene, Myus, and Miletus – were much the most advanced. Smyrna, in the north of Ionia, was in origin an Aeolian town, but at an early date it was captured by Ionians from Colophon.

In the 8th century BC the situation in Anatolia changed once again. The Phrygians emerged as a major political power, with their capital at Gordion. Relations between Phrygians and Greeks were close. Already in the 8th century BC the Phrygian king Midas was married to the daughter of Agamemnon, the king of Aeolian Cyme. This Midas was most probably the same one who sent a dedication (a throne) to the Greek sanctuary in Delphi. Decoration on some Greek pottery, bronze fibulae, cauldrons, bronze belts, etc. demonstrates Phrygian influence on Greek culture as early as the 8th century BC. Phrygia lost its dominant position after the Cimmerian raids of c.696 BC and became part of the Lydian empire, the dominant power from the mid-7th century BC having its capital at Sardis. The Ionian contribution to the creation of Lydian culture is witnessed in dress and in architecture (columns and relief panels). In Lydia and Phrygia buildings were decorated and protected by clay relief revetments, often decorated in a Greek style and depicting Greek mythological scenes. At the same time, Greeks took to worshipping the Anatolian goddess whom they knew as Cybele. Lydian rulers were hostile to Ionian and other cities. Alyattes destroyed Smyrna; Croesus subdued others but sent gifts to the temples in Delphi and Ephesus. This was a time when very close cultural links were forged between Lydia and the Ionians, bringing Graeco-Lydian art into existence. Lydian court life was more Greek than oriental in its physical aspects.

The Lydians were conquered by the Persians in 547/46 BC. For the next two centuries, until the conquests of Alexander the Great in 334 BC, this new Persian empire held mastery over Anatolia and the whole of the Near East, including the Greek cities of Anatolia. Many Ionians fled Persian conquest to establish colonies in the west and the east (around the Black Sea). Indeed the creation of Ionian colonies was already under way from the second half of the 7th century BC when Lydian pressure started to make itself felt.

Achaemenid art is a unique phenomenon. Monarchs started to create a court culture, bringing together artists from all corners of their huge domains. These artists, architects, and masons were employed by the king and executed work according to his tastes and wishes. During the construction of the palace in Susa, Darius recorded details of the programme of work: the ornamentation of the walls was brought from Ionia; the captives who worked the stone were Ionians and Sardians; Sardians and Egyptians collaborated on the woodwork; Babylonians on the brickwork; Medes and Egyptians on the decoration of walls and on goldsmiths' work. The sources of the materials used are also given: gold came from Sardis and Bactria; lapis lazuli and cornelian from Sogdiana; turquoise from Chorasmia; silver, ebony, and copper from Egypt; ivory from Ethiopia, India, and Arachosia; cedars of Lebanon were carried to Babylon by Assyrians, and thence to Susa by Carians and Ionians. The Ionian contribution to Achaemenid royal culture was considerable. Although Persian buildings, designed more for effect and ceremonial than for living, were inspired by Mesopotamia, masons were brought from Ionia and Lydia. Greek architectural orders and techniques were introduced to Persia. Nearly all the buildings at Pasargadae were built by Ionians. Persian sculpture reveals Greek influence and practice in the treatment of drapery; seals show Greek craftsmanship, as do the wall paintings from Gordion. The tomb monuments at Xanthus are decorated with stone reliefs executed in Ionian style.

The Persian empire was divided into provinces (satrapies). Usually, each conquered country formed a separate satrapy, sometimes with a local family as nominal rulers. The provincial capitals housed a Persian civil service and garrison. The king introduced a system of gift-giving and *tributari*.

The Ionian Greeks were supported by Athenians in their revolt of 499 BC. This led to Persian–Athenian conflict. In 492 BC Darius sent a force against northern Greece and in 490 BC to central Greece. Ten years later Xerxes marched against Greece and sacked Athens. By the mid-5th century BC the Greek cities of the eastern Aegean were free, under the hegemony of Athens. After the Persian Wars many Persian ideas filtered through to Athens. Persian metalwork had considerable

influence on Athenian pottery – rhyton (drinking-horn) cups are an example. The same can be seen in Greek seals, where the Graeco-Persian style flourished in Anatolia, reaching mainland Greece and spreading throughout the Greek colonial world.

Alexander the Great put an end to the Achaemenid empire. He burned Persepolis and liberated Greeks, including artists and intellectuals who had been persecuted by the Persians. The establishment of Hellenistic kingdoms on the ruins of the Persian empire opened the way to further penetration by and of Greek culture. Greeks followed Alexander the Great to Anatolia and the Near East, establishing new cities and new cultural centres, but at the same time absorbing features of local cultures to create new and cosmopolitan traditions.

The Hellenistic period in Anatolia brought fresh military difficulties. In 302 BC Lysimachus, a Macedonian from Pella, invaded Asia Minor, fought against Antigonus, and secured victory for Seleucus in the battle of Ipsus (301 BC). Most of Asia Minor passed to him, and he proved a financially rapacious ruler until his defeat by Seleucus in 281 BC. Thereafter the region was in the hands of the Seleucids who, from the outset, continued Achaemenid institutional practice in the army and administration and in their colonizing policies. One of their capitals was at Sardis. By the peace of Apamea, negotiated between Antiochus III and Rome in 188 BC, the Seleucids relinquished their possessions north of the Taurus mountains, retaining Pamphylia and Cilicia.

The Mithridates family ruled Pontus from 302 BC. Mithridates IV established good relations with Cappadocia and Rome (whose ally, Pergamum, he helped in a war against Bithynia). His successor invaded Phrygia and Cappadocia, maintained friendly relations with Greece, and was honoured as a benefactor of Athens and Delos. Mithridates VI Eupator was the most famous king of Pontus, and Rome's most dangerous enemy in the 1st century BC. He conquered the whole of the Black Sea and annexed Bithynia and Cappadocia. During the First Mithridatic War against Rome (89–85 BC) in Asia his army swept all before it, and he ordered the massacre of Romans and Italians living there. He was welcomed in Athens and won over most of Greece, but the Roman response under Sulla (87 BC) brought him defeat; Athens was captured, and the war taken to Asia. Peace was arranged and Mithridates lived to fight another day: to further defeat in the Third Mithridatic War in 63 BC and an assisted suicide at the sword of a bodyguard when his son revolted against him prior to further alleged foreign exploits.

The culture of Hellenistic Anatolia flourished. Troy IX was a Hellenistic city furnished with temples, theatre, odeum, *bouleuterion*

(council chamber) etc. Pergamum was a very important city, to the safety of whose fortress Alexander the Great's successor Lysimachus entrusted part of his treasure – 9000 talents. During the reign of Attalus I Pergamum became a wealthy and powerful state and the city a worthy royal capital. Its ruler could indulge in patronage of the arts, literature, and philosophy, and gain prestige and pleasure with his horses and chariots at Olympia and other Greek centres. Under Eumenes II the city achieved architectural eminence: the defended area of the acropolis was enlarged so as to contain a further large gymnasium and a second agora, the acropolis itself was built up on a series of grand arched terraces, and an advanced high-pressure water system put in place. The best possible use was made of the natural shape of the land to provide a dazzling backcloth to the expanding city below. The royal palace, barracks, and arsenal crowned the summit; lower down a library, second only to Alexandria's, overlooked the temple of Athena; on a lower level stood an altar to Zeus, 12 m high, which provided a rich opportunity for the local school of sculpture to portray the fight of the gods against the giants; still lower were the agora, and then a great terrace on arches, built into the rock, from which the theatre climbed up the hillside. In 130 BC the last member of the Attalid dynasty bequeathed this prosperous state to Rome and it became part of the province of Asia.

Ephesus and Miletus reverted to being centres of Hellenic culture in Asia Minor once they had recovered from Persian rule. Alexander the Great rebuilt Miletus. The temple of Artemis at Ephesus and the new marble temple of Apollo in Didyma were among the most impressive buildings anywhere in the Greek world.

Roman Asia, the jewel of the empire, comprised the territories of Mysia, Lydia, Pisidia, and Phrygia (Rhodes was added subsequently) along the western coast of Asia Minor. It was stable (the borders remained largely unchanged until the late 3rd century AD) and prosperous, and Hellenic influence remained strong. From 27 BC the province was under the authority of the Senate, administered by a proconsul based in either Pergamum or Ephesus. Administration varied from area to area, and many of the cities that had enjoyed a fair measure of autonomy under the Attalids retained it, despite their inclusion in the province. The province's economic strength was due mainly to its position astride the east-west trade routes, and that strength attracted migrants. Ports such as Smyrna, Miletus, and Rhodes flourished on the trade of foreign vessels passing through, and the cities invested their wealth in their own beautification. Greek notions of self-determination persisted in the cities, an echo of the polis. Schools of philosophy, education, and medicine functioned in Smyrna, Ephesus, and Pergamum; and Pergamum emerged as a centre

for eastern deities such as Asclepius. The acceptance of older eastern gods and the toleration of newer ones was another visible link to the absorbent nature of Greek civilization. This was the Roman province in which Christianity (initially, another cultural import assimilated from the east) and the early Church prospered.

Anatomy and Physiology

Repeated observations of human victims of warfare and accidents, and likewise of animal victims of hunting and sacrifice, probably underlie the remarkable familiarity with gross anatomy displayed in Greek literature from the *Iliad* to the early 5th century BC. Many Homeric descriptions of woundings bear witness to a precise knowledge of vulnerable points in the torso, notably of the anatomical disposition of

the principal organs and bones, and of the likely consequences of lesions to each.

Only with the systematic use of dissection did Greek anatomical knowledge advance substantially beyond the level reflected in Homeric epic. A controversial passage in a 4th-century AD commentary on Plato's *Timaeus* claims that Alcmaeon of Croton (5th century BC) first dared to cut out the eye and discovered its communication with the brain. Along with reports that Alcmaeon knew of the nasal passages and of certain features of the vascular system, this has led some modern scholars to conclude that Alcmaeon was the first to dissect animals for scientific purposes. Similar claims have been made for Democritus. There is, however, no conclusive evidence to support such inferences. Although several Presocratics displayed a keen interest in anatomical structures and in physiological processes such as perception, respiration, and reproduction, they clearly lacked close familiarity with the physical appearance and configuration of the internal structures they describe. According to Diogenes of Apollonia's extensive description (preserved by Aristotle) of the vascular system, for example, two independent networks of vessels (*phlebes*) are distributed throughout the body, one originating in the liver and serving the right side of the body, the other originating in the spleen and serving the left. The bilateral symmetry displayed by the external structure of the body here is apparently assumed to have an internal counterpart.

Hippocratic writings offer many anatomical observations (e.g. *On Places in a Human Being*, *On Fleshes*, *On Fractures*, *On Joints*, *Epidemics*, the pastiche known as *On the Nature of Bones*, and the Hellenistic treatise *On the Heart*). But no systematic Hippocratic treatment of anatomy as such is extant; a 27-line work of disputed date, *On Anatomy* – the shortest text in the vast Hippocratic Corpus – merely enumerates major internal parts of the human torso and summarizes their configuration. Diocles of Carystus, to whom Galen attributes the earliest treatise on anatomy, may have observed the womb in dissected mules, but there is no convincing evidence that he dissected human cadavers.

Aristotle, who occasionally refers to his lost work *Dissections* (*Anatomai*), dissected and vivisected various animals in the course of extensive zoological investigations that covered the lives, reproductive activities, and structures of well over 500 genera. He frequently referred to the human body, too, providing detailed observations on the vascular system and the internal topography of the body, particularly in his *History of Animals*. He acknowledged, however, that he relied on animal anatomy to make inferences about human anatomy and physiology (e.g. *History of Animals*, 1. 16. 494b21–4)

and, like Empedocles and others, he made the heart, not the head or the brain, the centre of cognitive activity (whereas Alcmaeon, Democritus, Diogenes, the Hippocratic author of *On Sacred Disease*, and Plato had recognized the central role of the brain).

Spectacular advances in anatomical knowledge were made in the early 3rd century BC, when Herophilus and Erasistratus became the first – and apparently the last – ancient physicians to conduct systematic dissections of human cadavers. According to credible ancient sources they also performed vivisectionary experiments on humans, probably on condemned criminals handed over to them by kings in the name of future benefits for all of humanity (Celsus, *Medicina*, proem. 23–26). Their discovery of the nerves, the four coats of the eye, the ventricles of the brain, the ventricles of the heart, the heart valves, the ovaries, numerous vascular structures, etc. had an enduring impact on the history of European anatomy and physiology. Herophilus and Erasistratus attempted not only to describe parts of the body but also to account for their functions on the basis of dissection and vivisectionary experiments. They diligently explored respiration, digestion, the pulse, reproduction, and sensory and muscular activity.

Not all ancient physicians agreed, however, that physiological explanations, even if discovered or confirmed by dissections, are necessary to clinical efficacy. The Hellenistic Empiricist “school” by and large rejected physiological investigation and systematic dissection, claiming that the accumulation and transmission of clinical observations, notably of observed instances of successful treatments (even when the success remained unexplained) generally sufficed. Numerous later rival physiological and anatomical treatises, some known mainly through Galen, bear witness, however, to the continuing importance of anatomy and physiology. Though advocating divergent doctrines, Asclepiades of Bithynia, Archigenes, Soranus, and Rufus of Ephesus presented wide-ranging physiological theories based on anatomical beliefs. Furthermore, extensive dissections of animals were conducted in the 2nd century by Marinus, Quintus of Rome, Satyrus, Numisianus, Pelops, and Galen.

Ancient Greek anatomy and physiology culminated in Galen, whose authority went virtually unchallenged for more than a millennium. Aware of the remarkable scientific results which Herophilus and Erasistratus had achieved by means of human dissection, Galen at times wistfully conceded that their access to human cadavers had enabled them to make observations which eluded him, even though his repeated, meticulous dissections of – and vivisectionary experiments on – apes, monkeys, pigs, goats, oxen, sheep, mules, horses, donkeys, mice, and other animals allowed him to correct the accounts of many predecessors. To some extent Galen’s anatomy is characterized by the

superimposition of the soft parts of apes upon the human skeleton, despite his frequent insistence that a dissecting physician should try to choose animals that most closely resemble human beings. He presented his anatomy most fully in his monumental *On Anatomical Procedures* 1–15 (of which more than six books are extant only in a 9th-century Arabic translation). Several shorter anatomical treatises also survive (e.g. *Anatomy of the Womb*, *Anatomy of the Nerves*, *Anatomy of Arteries and Veins*, and *Anatomy of Muscles*).

Galen insisted that anatomy is a prelude not only to surgery but also to physiology. His comprehensive commitment to a teleological explanation of every structure, part, activity, and susceptibility of the body is visible throughout his voluminous anatomical and physiological writings. He fused his expropriations of the theories of several precursors into a coherent teleological model, in which all major physiological activities – respiration, digestion, heartbeat and pulsation, sensation and perception, voluntary and involuntary movement, locomotion, reproduction – are interdependent and interactive. He adapted the four-humour theory of the Hippocratic author of *On the Nature of a Human Being*, introducing more systematic, elaborate correlations between the primary qualities (hot, cold, wet, dry), the elements (earth, air, fire, water), the humours, the four seasons, character types or “constitutions”, and stages of life. Inspired by the Platonic theory of a tripartite soul, Galen argued that there are three souls ruling yet serving the body, each manifesting itself through a distinctive faculty (*dynamis*, i.e. a power to act or to be acted upon). In the brain resides the “psychic faculty” which, presiding over reason and thought, renders sensation, perception, and voluntary motion possible. In the heart resides the “vital faculty”, responsible *inter cilia* for our emotions. And in the liver dwells the “natural faculty” responsible for nutrition. In *On Natural Faculties*, which Galen recommended to his readers as a sequel to *On Anatomical Procedures*, he added subsidiary faculties, including the “attractive faculty” (e.g. to explain how all parts of the body “attract” nutriment from the blood), the “retentive faculty” to explain how substances can remain in any given place within the body, the “alterative faculty” (e.g. to account for the conversion of food into blood), the “expulsive faculty” to explain secretions and excretions, etc.

A further central feature of Galen’s physiology is his theory of innate heat. A flame of life inside the body, innate heat needs air to sustain itself while being tempered continuously by cooler, freshly inhaled air. Some Hippocratics (e.g. *On Fleshes*, 2) and Plato had recognized that bodily heat is essential to life, but for this feature of his physiology Galen seems most indebted to Aristotle. Against those who claimed that the body upon birth acquires heat from without

(e.g. Praxagoras, Erasistratus), Galen endorsed the view of Aristotle and the Pneumatists, arguing that we are born with this natural heat, which is the first instrument of the soul. He further agreed with Aristotle that the innate heat is purest and most intense in the heart, and he added that the arteries distribute heat (along with blood and *pneuma* (breath), as Herophilus had claimed) throughout the body.

From Herophilus, Galen also took over the distinction between sensory and motor nerves, and from Erasistratus – against whom Galen wrote more than one fiercely polemical treatise – the influential distinction between “psychic *pneuma*” (in the nerves) and “vital *pneuma*” (in the arteries). According to Galen, the spongy flesh of the lungs acts upon the air we inhale, converting it into a subtler product, *pneuma*. This refined breath passes through very fine “pores” into branches of the pulmonary vein (or “venous artery”, in Galen’s conception) and thence is “attracted”, with blood, by the attractive faculty into the left ventricle of the heart, where it encounters more hot blood and becomes metamorphosed into life-giving, i.e. “vital” *pneuma*. When this cardiac ventricle contracts, blood charged with “vital” *pneuma* is “attracted” into the aorta and thence into the entire arterial network. After the carotid arteries have distributed vital *pneuma* to the brain, the brain transforms it into “psychic *pneuma*”, in part by using air drawn into the cerebral ventricles by way of the nostrils and channels extended into the olfactory bulbs. From the brain psychic *pneuma* – subdivided into sensory and kinetic *pneuma* – flows through imperceptible ducts inside the sensory and motor nerves, enabling sensation and voluntary muscle movements. Medieval Galenists described a third kind of *pneuma*: “natural *pneuma*” produced in the liver, transported through the veins, and functioning as the instrument of the “vegetative” soul. In the vast corpus of Galen’s extant texts there is, however, only a single, hypothetical allusion to “natural *pneuma*” (*Method of Healing*, 12. 5).

Perhaps nowhere is Galen’s commitment to teleology expressed more emphatically than in his discussion of reproduction in his major physiological treatise *On the Usefulness of the Parts* (books 14 –15), in which he once again fuses the views of many predecessors, even as he criticizes them. With “astonishing skill” Nature has done all she could to make her mortal work – the human body – immortal through reproduction, endowing humans with perfect anatomical instruments for conception, a faculty joined to these instruments to produce pleasure, and a “vegetative soul” that has an irrepressible desire to use the instruments of conception. Being essential to human reproduction, gender-specific anatomical features display Nature’s amazing providence: the uterus is bicameral, its hotter right chamber being for the conception and gestation of males, and the colder left chamber for

female offspring. To traditional polarities used at least since the Presocratics and Hippocratics to distinguish between female and male – left- right, colder-hotter, weaker-stronger, less perfect and more perfect – Galen added the influential polarity introverted – extroverted: because the female foetus develops in the colder left womb, her generative parts remain inside her body, whereas the male, developing more fully in the hotter right uterus, has extroverted reproductive parts. In support of these in part archaic polarities Galen mustered the formidable weaponry of his meticulous dissections, of his elaborate physiological system, and of his all-encompassing teleology, thereby rendering the old anatomy and physiology scientifically rejuvenated.

Many currents of pre-Galenic anatomy and physiology thus were appropriated and selectively transformed by Galen into an authoritative new medical system which, by and large, was not superseded in Europe and the Near East until the early modern period. Byzantine writers excerpted, paraphrased, and adapted his works on anatomy and physiology, while scholars in Baghdad translated them into Syriac and Arabic, especially in the 9th century, thus ensuring that Galen's views became the almost un-disputed norm until systematic human dissection was resumed in the early Renaissance.

Anaxagoras c.500–428_{BC}

Philosopher

Anaxagoras was born in the Ionian city of Clazomenae. After establishing himself as a philosopher there, perhaps by giving lectures or classes, he seems to have come to the attention of Themistocles, who invited him to Athens, where he lived from some time after 470_{BC} until he was exiled in the late 430s_{BC}. His expulsion was due partly to his friendship with Pericles, and partly to his scientific views, which took no account of the traditional gods in explaining the nature of the heavens. He spent his last few years in Lampsacus.

Although several works are ascribed to him, he probably wrote only one, but it may well have undergone revisions during the course of his stay in Athens. The fame of this book was guaranteed by the reference to it in Plato’s *Apology*, where Socrates says that it can be bought in the Agora for a drachma. Elsewhere in Plato’s dialogues, most notably in the *Phaedo*, Socrates says that he was disappointed when he read it because Anaxagoras explains everything, including the nature of man, with a reference to what today we would call its chemical makeup, which in turn is governed by *nous*. This is the force that first set the universe in motion and which still determines the mechanism of our changing universe, from the large-scale phenomena of the heavens to (borrowing a term from modern physics that derives from the atomists

contemporary with Anaxagoras) the subatomic arrangement of every object; *nous* is often translated as “mind” or “intelligence”, and reasonably so, given Plato’s punning on the “mindlessness” of Anaxagoras’ use of this word. As is clear from Socrates’ several attempts to distance himself from Anaxagoras, as well as from Aristophanes’ broad satire of Socrates in the *Clouds*, Anaxagoras’ contemporaries understood his *nous* either as a new divinity to rival Zeus in his stewardship of the heavens or as a mechanistic (and hence atheistic) cosmic principle. Since Anaxagoras thought that *nous* was present only in some things, presumably animals and plants, the true nature of his *nous* lies somewhere between the anthropomorphic (and somewhat unpredictable) Zeus and what we might call the laws of Nature.

Although it is tempting to think of *nous* as non-corporeal, Anaxagoras’ own words of description are merely that it is the “lightest and purest of all things”, and is the only thing capable of existing in a pure form, with no admixture of normal matter. As such, it is not only self-ruling, it also rules all else. In the universe as a whole it works largely by setting things into a vortex that separates heavier objects from lighter ones, pushing the former into the centre, much as a whirlpool can drive pebbles into its middle. Thus the “Socrates” in the *Clouds*, in fact an amalgam of several sophists and Presocratics, presents as a new divinity a pot called *dinos* in Greek, which puns on Zeus/ Dios and *dine*, the vortex responsible for the formation of all the heavenly bodies in Anaxagoras’ theory.

Just as the vortex stirs things up so that like objects have the opportunity to unite with each other, so too does the breakdown of food during digestion allow like to join with like. (The attraction of like to like was a common belief raised to a scientific principle by many Presocratics.) Anaxagoras, that is, thought that the building blocks of animals (blood, flesh, bone, hair, etc.) were contained within the food they consumed, for, as he says, “how could hair come from not-hair and flesh from not-flesh?”

Much of the first part of his book was devoted to explaining the microscopic nature of matter. Since nothing can come from nothing, there must be some basic unchanging material. And since visible matter takes many forms, few if any of which are permanent, this bedrock of matter must itself come in different, but at this level unchanging, forms, which Anaxagoras metaphorically called “seeds”. Thus far, Anaxagoras may be compared to the first atomists Leucippus and Democritus; but his explanation of seeds differed markedly from their atoms. Each seed is indestructible, with fixed shape, colour, and savour. Also fixed is the ration of *dynameis* (roughly “powers” or “qualities”) contained within each seed, which tend to exist in polar

pairs. These *dynameis* are of an unknown number, but the chief ones named by Anaxagoras are hot/cold, dark/light, heavy/light, and moist/dry. Since each seed contains a fixed amount of *dynameis*, its nature is determined by the combination of the various ratios. Thus, a stone has more heavy than light (both imagined to exist in the same seed simultaneously) and more dry than moist. The facts of nutrition can accordingly be explained by, for example, bread's containing seeds too small to be seen of flesh, bone, hair, etc. The scientific principle at work here – of comprehending the unseen by means of appearances – was expressed by Anaxagoras himself in the form “phenomena are a view of the unseen”.

Since, roughly speaking, any object in the cosmos is a mixture just as is the cosmos itself, and since one thing (that is, an object characterized by a certain ratio of qualities) can break down and “become” another, Anaxagoras also deduced that “everything is in everything”. For these and similarly scientific attempts to explain matter, change, and causation, Anaxagoras was compared by Aristotle to a sober man among stammerers. He and Democritus were credited by Aristotle and others with elegant and comprehensive theories that could explain both large- and small-scale phenomena.

DAVID SIDER

Biography

Born in Clazomenae c.500 bc, Anaxagoras moved to Athens after 470 and remained there until exiled in the 430s. He died in Lampsacus in 428 bc. He wrote (probably) just one book, of which substantial fragments are preserved by Simplicius. It is largely concerned with the nature of matter, which he sees as being governed by a promordial *nous*.

Anaximander

Philosopher of the 6th century ^{BC}

Anaximander of Miletus was active in the first half of the 6th century ^{BC} (the date of his death is given by Diogenes Laertius as 547/46 ^{BC}). He was said to have been a pupil and kinsman of Thales of Miletus, and is included by ancient historians of philosophy among the group of early thinkers who tried to explain the world on the basis of a single material substance. No work of his survives. For our knowledge of his ideas we rely entirely on reports given by later writers from Aristotle onwards; most of the available information comes from authors writing in the 1st century ^{AD} or later, and in these cases it is likely that they are relying on general histories of philosophy and encyclopaedias that go back ultimately to the work of Aristotle's successors (especially Theophrastus).

According to Anaximander, the originaive substance was the *apeiron*, a term whose precise meaning is not entirely clear; it might mean either infinite or indeterminate, though since Anaximander believed that his originaive substance had both of these qualities the uncertainty does not affect the interpretation of his ideas. The creation of the cosmos came about by the separating out of the opposites from the *apeiron*, in such a way as to achieve an overall balance; the details of this process are obscured by the tendency of our sources to assimilate Anaximander's system to one of the cosmological views of their own time (so making the *apeiron* a mixture or an intermediate substance). The *apeiron* surrounds and controls the cosmos, and is eternal, unageing, and perhaps divine. Anaximander apparently produced something like a complete cosmology. He believed that the earth was cylindrical, its depth a third of its width, and that it was supported by nothing, but stayed where it was because it was equidistant from everything else. The heavenly bodies, he believed, were rings of fire, enclosed except at points where there were holes through which the fire showed through. He claimed that the ring of the sun was 27 times, and the ring of the moon 18 times, the size of the earth. Eclipses were caused when the holes were blocked up (though we are not told what causes the holes to get blocked up). He explained rain as arising from moisture that evaporates under the influence of the sun, and thunder as the wind, enclosed within clouds, breaking out. He seems to have believed also that the earth was drying out (perhaps impressed by the receding coastline in Ionia). Reports of his views on the origins of life are intriguing, though enigmatic. He apparently believed that life originated in moisture, and that the first creatures came into being enclosed in a bark-like shell, which they subsequently shed. In the case of human beings, he argued

that, since the human infant is incapable of looking after itself for some years, the first people must have come to maturity under the protection of some other creature; they grew to puberty, he claimed, within fish-like animals, from which they emerged in adulthood when they were old enough to be self-sufficient.

It is, however, his production of the first known Greek map that most interests the ancient sources. Maps had, of course, been known to the ancient societies of Mesopotamia for centuries, and it is not surprising that it was in a trading city like Miletus that the concept was first introduced to Greece. There is another intriguing report that Anaximander invented the gnomon (a kind of simple sundial), which he used to mark solstices and equinoxes, and that he set one up in Sparta. He did not invent the gnomon, in fact, because it already had a long history (indeed, Herodotus attributes its invention to the Babylonians), and this may be another case of Anaximander's introducing foreign ideas to Greece. He was the first known Greek to attempt to produce a complete, comprehensive, and rational account of the world and its development, including the early history of the human race.

Anaximander is also the first recorded writer of Greek prose. He is said to have written a number of books, and an account of his cosmology given by Simplicius (writing in the 6th century AD) in his commentary on Aristotle's *Physics* (24. 13) may contain a quotation from one of them: "that from which existing things have their coming-into-being is also that into which they are destroyed according to necessity; for they pay penalty and retribution to one another for their injustice, according to the assessment of time" (as he puts it in these rather poetic words). Unfortunately, it is impossible to say for certain where the quotation begins and where it ends, but it is probable that in this passage is contained the earliest surviving piece of Greek prose.

Biography

Active in the first half of the 6th century BC, Anaximander of Miletus is said to have been a pupil of Thales of Miletus. None of his writings survive; but we learn from later writers that he tried to account for the world on the basis of a single material substance which he called the *apeiron* (the infinite or indeterminate). He also was the first known Greek to draw a map. He died c.547 BC.

Ancestor Worship

The tendency has been noted (Antonaccio, 1995, p. 268; cf. Humphreys and King 1981, p. 267) that, where political power is fluid and personal, the focus, on occasions of death, impels towards the intense interaction of the living; on the other hand, where the base of power is more stable, resting with a historically grounded social group, care of the dead becomes the focus. There is evidence of both with the Greeks, reflecting the belief in the power of the dead over the living and the inconstancy of political structures.

Mycenaean burial sites, where the norm was collective burial in chamber tombs or tholoi, suggest that certain tombs were singled out for special treatment, but that the dead were not worshipped. The evidence indicates instead that veneration of the deceased was not practised, since tombs were often reentered, and earlier relics and grave goods swept aside or removed. Those ancestors who drew continued interest and with whom claims of connection were maintained were usually claimed as “heroes” and their personal histories and the status or power ascribed to them after death tended to be reinterpreted according to the needs of the descendants. There is no consistency in the accounts of the births, lives, or ends of these glorified ancestors (heroes sometimes disappear rather than die), but they were believed to have lived mortal, if extraordinary, lives.

Conviction held that ancestors reigned over present events. Patrons and guardians to their progeny, they could grant success in diverse endeavours or curse them with disaster – barrenness, disease, pestilence, or military failure. Thus the dead were rarely ignored, even where not worshipped. They were remembered, feared, and invoked by the living through prayer, votive dedication, animal (and in some cases even human) sacrifice, and commemorated in poetry, in song, and at athletic events. The variety of “heroic” ancestry grew over time until, by the late Classical period, athletes, founders of colonies, and even ordinary folk came to be “heroized” as supermortal.

Links with the ancestral past tended to be broken on the mainland during the Dark Ages except in the colonies where Homeric tradition was preserved, and later reintroduced to the mainland during the “renaissance” of the late 8th century BC. The close of the Dark Ages was accompanied by a revival of enthusiasm for the past, born partly of the nostalgia for lost ancestral links, but also as a matter of

expedience, as heroic personifications were adopted to lend legitimacy and historical grounding and to provide patronage for the newly founded city or polis. Ancestral claims could also be strategically deployed to reinforce the power of an elite now threatened by the emergent polis and the levelling tendencies of democracy. The “ancestral yearning” (Snodgrass, 1971, pp. 195–96) of this period is witnessed in art, literature, and ceremonial ritual. Formal hero cult was intense during this period. Tomb cult, one of its manifestations, is connected to the loss of stability in social structures and the struggle for the control of land during the transition from pastoralism to an agricultural society. Noteworthy ancestry could aid in the project of legitimizing and stabilizing the power of certain families, connecting them with an epoch of excellence and lending authenticity to claims of landownership. Tomb cult offerings, though largely private and unofficial, also provided a personal connection with the ancient inhabitants of a place, securing the protection and the favour of ancestral powers and appeasing the anonymous hostile forces thought to dwell therein. Tomb cult peaked in the 8th century BC and continued into the Classical period.

During the late Iron Age trade and prosperity intensified, creating greater social and cultural complexity. Where the region favoured social interaction among the elites, claims of ancestry remained a matter of prestige and burial custom stayed competitive. Teams of asses or horses, armour and weaponry, and a variety of luxury imports were buried with the deceased and there is evidence, at the grave site, of intense ceremonial activity among the living. However, as configurations of power tended towards the personal and fluid, claims of archaic ancestry declined, as did extravagance of burial custom once sanctuaries came to be employed as the arena for communal and regional competitions. In the more isolated regions, however, the ancestral claims of older families were probably maintained.

The well-established polis continued the practice of corporate worship of the ancestral spirits. This provided a unity to its worshipping community, though it could also have a divisive effect since it tended to serve the power of the aristocrats. Some tomb cults were ongoing, monuments being claimed by later generations, but generally they were of short duration and limited scope. As political power came to depend on the redistribution of wealth and on the charismatic draw of individuals, kinship claims were no longer the necessary base of power. During this period there is evidence of a continuing concern for the ancestral past. The dead continue to be related to one another, graves being connected by mounds or tumuli and enclosed within walls for protection against encroachment by expanding settlement.

Scholars generally agree that the antiquity of the Greek clan or extended family (*genos*) over centuries is a myth without foundation (Cavanaugh, 1991, pp. 100, 103; Antonaccio, 1995, pp. 252–53, 264). Even the most prominent families had no extensive pedigree. In Attica there is no evidence of long-term use of a common lot at any time from the Mycenaean to the Classical period. Nor is there any sign of the continual tending of graves or consistent cult worship. Ancestral links seem to have been maintained over four generations or less, whether oral or written records helped to keep genealogical memory alive.

On the whole, times of instability and social disruption tended to favour a nostalgia for the past, impelling towards reaffirmations of heroic ancestry, renewed family-based claims of political legitimacy, and increased belief in the power of the dead, evidenced by greater care of the burial sites. With increased stability and prosperity, less emphasis was placed upon ancestral heritage, and there was a return to corporate burial. In the latter case, vigorous interaction between the living tended to be the focus rather than care of the dead.

In the early centuries of the Christian era, the Roman empire's contact with the east brought a blaze of interest in Near Eastern, Egyptian, and Oriental mystery religions, eclipsing for a time the glories of its Greek heritage. As Rome began to crumble, eastern influences triumphed over Classical tradition, not so much because of the superior splendour of the oriental, but because its mystical bent was more suited to the needs of the decaying empire. Its secret ritual practices, its pomp and ceremony, but also the sense of discipline and fellowship it promoted, brought consolation to the world-weary spirit in this era of decline. By the 3rd century Mithraism had spread throughout the empire, embracing the bulk of the army. Though the disillusioned were no longer drawn by the pagan insights of the sheer joy of life, characteristic of the Greeks, eastern mystery cults did promote the belief in the continuance of the soul and the cycle of rebirth, which continued the demand for reverence for the ancestors.

Upon the rubble of decaying Rome the emperor Constantine erected a new empire, Byzantium, committed to Christianity. To complete the transformation of the new empire, he established a second capital city, Constantinople, dedicated in AD 330. This site embraced all the elements of the reformed empire – Greek, Roman, and Christian – but, since it was set on the Greek-speaking coasts around an old Greek city, it was the Hellenistic past of the new empire that was highlighted. Constantine did all that he could to promote that historical connection, making the city a centre of education and the arts, stocking its libraries with Greek manuscripts and its museums with Greek treasures, and beautifying its streets and squares with Greek

works. An obsession with its Hellenistic past flared throughout the empire. Even in the 12th century aristocrats were said to boast that their ancestors had arrived with Constantine (Runciman, 1933, p. 28).

Animals

In Hellenic society animals have been essential with regard to the practicalities of farm work and food production, transport and war, hunting and sacrifice. Yet for the Greeks the cultural significance of animals goes beyond the practical. Greek myth in words and pictures represents real and imagined animals to explore culture, and uses them as conceptual tools. The Greeks not only used animals for practical purposes, they also used animals to think with.

In Greek society, predominantly rural, animal husbandry has always been important and in the late 20th century nearly one-third of the Greek population works in agriculture, although many farm animals are now reared indoors, often by intensive methods. The imagery of farming has informed Greek expression from Homeric epic on, where "towards evening" is rendered as "the time for unyoking oxen" (*boulytonde*, as in the *Iliad*, 16. 779 and the *Odyssey*, 9. 58), while the early system of writing left to right and back again was described in terms of oxen ploughing (*boustrophedon*). Even the Greek gods were herdsmen (Apollo in the *Homeric Hymn to Hermes*; Helios in the *Odyssey*) and Zeus, Poseidon, and Dionysus have special taurine associations. Sheep and goats were indispensable for their wool as well as their milk and meat (Theocritus' goatherd and shepherd argue about whose fleeces are best, *Idyll* 5) and feature often in the mythic imagination. Pan is the goat god and the song that accompanied the

sacrifice of a billy goat (*tragos*) is linked to the development of tragedy, while the shepherd tending his flock is a common literary theme; Polyphemus and Paris on Ida are early examples, while the Hellenistic pastoral of Theocritus and Longus romanticized shepherds as figures of past innocence, and Christian iconography represents Christ as a shepherd caring for his flock.

Animals were the objects of scientific enquiry for scholars such as Aristotle (*History of Animals*) and the 14th-century writer of the Byzantine *Diegesis ton Tetrapodon Zoon* [Descriptions of Four-Legged Animals]. Foreign fauna interested travellers such as Herodotus and Kosmas Indikopleustes and the Byzantines exhibited exotic creatures such as lions, leopards, crocodiles, bears, antelopes, and ostriches in the hippodrome and in zoos—in the 11th century Constantine IX Monomachos set up a menagerie in Constantinople (Attaleiates, 48–50). Wild animals provided entertainment by fighting (*theriomachountes*), each other or humans; animal–human combat is documented by Justinian I (*Novellae*, 105. 1) and features in Christian martyrology and hagiography.

Horses were valued highly for their service in battle and equestrian competition. The Homeric heroes in their horse-hair-crested helmets fight from horsedrawn chariots and many, in particular Hector, are epithetically tamers of horses. Several war horses have their names recorded (unusual for animals): Alexander's Bucephalas was famous (Plutarch, *Alexander*, 61, Strabo, 698) while Achilles' horses, including Xanthus who prophesied Achilles' death (*Iliad*, 19. 478–94), mourned Patroclus (*Iliad*, 17. 443–47). At Athens the citizen class of cavalrymen, said to have been instituted by Solon, consisted of men from wealthy families – the cavalry provided their own horses. Equestrianism was associated with the rich; in Aristophanes' *Clouds* Strepsiades complains that his son is bankrupting him with his mania for horses and racing. At the Panathenaic games competitors rode bareback or drove four-horse chariots around the race course (*hippodromos*). Pindar in an epinician ode records the victory of a successful racehorse, Phereenicus (*Olympian*, 1. 18), and many of the prize vases presented to the victors depict races. However, Church Fathers such as John Chrysostom were less enthusiastic about horse-racing (*Patrologiae Cursus, Series Graeca*, 59. 519. 33–34).

Animals are often anthropomorphized; writers from Aesop to Aristotle (*Historia Animalium*, 488b13–24) ascribed to animals human characteristics, while Aristophanic comedies such as *Birds* and *Wasps* and the political verse of 14th-century Byzantium such as Theodore Prodromos's *Katomyomachia* and the anonymous *Porikologos* and *Opsarologos* used animals to satirize contemporary society. Human beings are often described in animal terms – greedy people are like

wolves, timid people are like deer, and, according to Semonides' poem of the 7th century BC which categorizes women according to animal type, chaste women are like bees (fr. 7 Diehl). The animal skins worn by maenads and the lion slayer Heracles represent an immediate association with the natural and the wild, yet too intimate an affinity with the bestial collapses the radical distinction between humans and other animals, an important predicate of Greek thought in antiquity and the Christian era, although the theory of reincarnation associated with the Pythagoreans which envisaged the transmigration of human souls into animals' bodies blurred this boundary. Hesiod separated man from animal on the grounds that men possess justice and do not eat one another (*Works and Days*, 276ff.); the Homeric hero should display the ferocity that wild creatures embody (Achilles entering battle is a ravening lion, *Iliad*, 20. 164–73) but should not become too beastly (Achilles' desire to eat Hector raw, *Iliad*, 22. 345–46)); the wild carnage and desire to eat raw flesh assimilates the bestialized man to the non-human, a wild animal or a monster like the uncivilized, cannibalistic Cyclops.

Greek myth transforms human beings into animals typically as a punishment: the witch Circe turns Odysseus' crew into pigs (*Odyssey*, 10. 233–43); Artemis makes Callisto a bear and Actaeon a stag; Lycaon, who sacrificed his child to Zeus, became a wolf (and was associated with the werewolf cult). Myth produced a variety of species hybrids like the hippocampus (horse– fish) and chimaera (lion–snake–goat) but Greek myth was interested particularly in animal–human mixtures such as satyrs (donkey–men) and centaurs (horse–men), anomalous creatures which, in blurring the human–animal boundary, draw attention to its importance. The wildness of drunken satyrs, played in satyr drama and painted on sympotic pottery, suggested the dangerous pleasures of bestializing Dionysiac excess; the centauromachy of the Parthenon in which the savage centaurs who disrupt the wedding feast are defeated by the Lapiths signifies the victory of civilization over wildness. Animal imagery is important too in Christian myth and iconography; in the Byzantine period the *Physiologos* and *Hexaemeron* used animals to symbolize virtues and vices and throughout the Christian era the devil has been represented as a snake. Dragons too were identified with evil and with enemies of the Church such as the emperor Julian (361–63); saints such as George and Elisabeth were portrayed defeating dragons.

Artemis, associated iconographically with the stag, was mistress of wild animals (*Iliad*, 21. 470) and she protected them, although as the huntress she killed beasts. Similes of hunting and wild predators are common in Homer and scenes of horses and hounds were popular with artists, who depicted the killing of deer, boar, hares, and lions. In

the Byzantine period scenes of animal–human combat were added to this repertoire, as were illustrations of falconry, a popular pastime. A portion of the hunted animal was offered to the gods, yet wild animals were seldom thought to be the proper objects of sacrifice (one exception is the cult of Artemis at Patras: Pausanias, 7. 18. 12). The ritual slaughter of domestic beasts, however, was ubiquitous, although the vegetable offerings and vegetarianism of Orphic and Pythagorean cult ran counter to this principle. The best sacrifice was a bull; also of value were cows, sheep (rams were better than ewes), pigs, and poultry. Pigs were slaughtered in purification rituals. Fish and smaller animals were rarely offered to the gods, although Pausanias mentions puppy sacrifice (3. 14. 8).

The choice of sacrificial victim sometimes mirrored a religious iconography that frequently associated gods with specific animals: at Athens Athena, who carries a goatskin aegis, was honoured with goat sacrifices, while more generally bulls were connected with Zeus and Dionysus, cattle with Hera, doves with Aphrodite, and horses with Poseidon, mythically the ultimate ancestor of the horse. Typically sacrifice entailed the ritual cutting of the animal's throat, but at Argos horses were drowned for Poseidon (Pausanias, 8. 7. 2). Christianity rejected the tradition of animal sacrifice but pagan magic continued to use animals.

Animals were important in prophecy; seers inspected the entrails of sacrificial victims and augurs inferred the future from watching birds in flight and, less commonly, fish swimming. Birds of prey were particularly significant: the eagle was Zeus' bird, and Hesiod's tale of the hawk and the nightingale is a fable of kingly power (*Works and Days*, 202–12). Snakes, thought to be intermediaries between this world and the next, were associated with oracles, with the dead, and with chthonic deities such as Aeschylus' snaky-haired Erinyes. Indeed, several autochthonous myths have serpentine nuances; Cecrops, the first earthborn king of Athens, was a serpent from the waist down, while the foundation of Thebes was marked by the birth of the Spartoi, sprung from the dragon's teeth.

Anthology, Greek

Collection of epigrams from the 7th century BC to the 10th century AD

The present *Greek Anthology* is the culmination of a process of anthologizing which began in the 3rd century BC. It properly consists of two collections of epigrams written mainly in the elegiac metre. The *Palatine Anthology* is a compilation from the 10th century AD of 3765 poems, so called from a manuscript once in Rome and now divided between Heidelberg (Universitätsbibliothek, Palat. gr. 23) and Paris (Bibliothèque Nationale, suppl. gr. 384). The *Planudean Anthology* is a 13th- or 14th-century compilation of approximately 2,400 poems, of which 388 do not appear in the *Palatine Anthology*. It was this shorter collection, first published in 1494 by the Byzantine émigré John Laskaris, that was long known in the West as the *Greek Anthology*. The *Palatine Anthology* was not published until the early 19th century, by Friedrich Jacobs (Leipzig, 1813–17).

It was common practice for individual poets of the Hellenistic period to collect their own short poems into an individual book, and the *Soros* [Heap] may have been a joint edition of the epigrammatists Asclepiades, Posidippus, and Hedyllus in the early 3rd century BC. True anthologies of poems by different authors were much rarer, although there is some scanty evidence for them from the end of the 4th century BC. The earliest extensive such compilation known today appears to be the *Stephanos* [Garland] of Meleager of Gadara in Syria, which was put together around 100 BC. This is an artistically arranged selection of poems from the previous two centuries, to which Meleager added a preface in which he named all the poets and attributed to each the name of a flower. His collection included graceful poems of his own composition, mainly erotic and addressed to both boys and girls. A second *Garland*, arranged alphabetically by the first word of each poem, was compiled, probably during the reign of Nero, by Philip of Thessalonica. His choice was more eclectic than Meleager's with less emphasis on love and more on rhetorical description (his personal contribution comprises 80 such poems). The first compilation to be called an "anthology", literally a "gathering of flowers", is that of Diogenianus of Heraclea during the time of Hadrian, although the title may be a lexicographer's description and not Diogenianus' own. *Cycle* was the name selected by the lawyer and historian Agathias of Myrina for a further anthology published probably shortly after AD 560. This contains classicizing epigrams by his Constantinopolitan friends and about 100 from his own hand.

The first really comprehensive anthology was that of Constantine Kephalas, who was possibly a palace chaplain mentioned by chroniclers as active in 917. It comprised the poems gathered by

Meleager, Philip, Diogenianus (probably from a 4th-century abridgement), Agathias, and other anthologists and in further individual collections such as the pederastic *Musa Puerilis* of the 2nd-century AD poet Straton of Sardis and the often humorous and satiric poems of the 4th-century AD Alexandrian schoolmaster Palladas. Remarkably, it also included poetic inscriptions on Byzantine churches copied down by a contemporary, the *magistros* Gregory of Kampsas (in Macedonia), during his travels in Greece, Macedonia, and Asia Minor. Although Kephala's anthology is lost, it formed the bulk of the surviving *Palatine Anthology*. This huge compilation included additional Christian and rhetorically descriptive epigrams. Its compiler is unknown, but it may have been the early 10th-century poet Constantine of Rhodes, three of whose poems it includes.

The *Palatine Anthology* is divided thematically into 15 books of widely differing lengths. Their contents are: (1) 123 Christian epigrams that are mainly copies of inscriptions on Byzantine churches; (2) 65 descriptions in hexameters by the 5th- to 6th-century Egyptian poet Christodoros of Koptos (known also as of Thebes) of the statues of Classical mythological and historical figures in the baths of Zeuxippos in Constantinople; (3) 19 epigrams on filial mythological themes inscribed by two brothers on the columns of a temple at Cyzicus in honour of their mother; (4) the four prefaces to their anthologies of Meleager, Philippos, and Agathias (2); (5) 309 amatory epigrams; (6) 358 dedicatory epigrams; (7) 748 epitaphs; (8) 254 epigrams of St Gregory of Nazianzus; (9) 827 declamatory and descriptive epigrams; (10) 126 hortatory epigrams; (11) 64 convivial and 378 satiric epigrams; (12) 258 erotic and usually pederastic epigrams attributed, probably not always correctly, to Straton; (13) 31 miscellaneous poems in 30 different metres or combinations; (14) 150 arithmetical problems (perhaps all by Metrodoros), riddles, and oracles; (15) 51 miscellaneous poems including six *technopaegnia* (jeux d'esprit), the shapes of whose lines resemble panpipes, an axe, a pair of wings, an altar (two poems), and an egg.

Around 1300 Maximus Planudes, a scribe in the imperial palace and translator of Latin texts, made his own anthology of epigrams. For this he used three now lost manuscripts, two of collections similar to the *Palatine Anthology* and a third of an abridged version of Kephala's collection. Planudes both rejected many poems and, making skilful use of his metrical knowledge, "emended" others to reflect contemporary propriety. The *Planudean Anthology* is divided into seven books – epideictic, satiric, funerary, ekphrastic epigrams, the hexameters of Christodoros, votive, and amatory epigrams. Each book is subdivided, poems on each theme being arranged alphabetically. Planudes' autograph manuscript (Venice, Biblioteca Nazionale Marciana, Marc.

gr. 481) is dated 1301 (or 1299) and there survive also a preliminary and an incomplete final revision done under the compiler's supervision. The 388 poems unique to this compilation, usually collectively called the *Planndean Appendix* or, incorrectly, book 16 of the *Palatine Anthology*, are mainly epigrams about or imaginarily inscribed upon statues and paintings.

The *Anthology* has had a decisive influence on the literatures of modern European languages, especially during the Renaissance. In Greece itself, however, it was largely unknown to the vernacular poets, and the writers in the “purified” language (katharevousa) turned rather to French and Italian models. The main exception is Cavafy, an Alexandrian like many of the poets in the *Anthology*. Many of his poems are on Hellenistic themes, while the homoerotic ones are often inspired by or even based upon the *Anthology's* epigrams of death and love. Unlike their predecessors, however, they are not pederastic, and, despite being less explicit, are generally more sensuous and anguished as a result of both his own personality and the contemporary attitude towards homosexuality.

The *Greek Anthology* is a garden with possibly more weeds than flowers, but it shows in an incomparable way the development of the genre of the epigram over more than one and a half millennia. It contains some of the most exquisite poems ever written in Greek: the world would be immeasurably the poorer were it not for its survival.

Anthropology, Social

Social anthropology (*anthropos*: Greek for “human being”) involves the study of societies, particularly the cultural values and institutions such as religion, law, or politics that organize relations between people. Anthropologists attempt to understand how people in various communities perceive and inhabit their worlds. The focus below will

be on social anthropological studies of Greece as well as anthropological studies done by Greeks.

Herodotus is generally viewed as the father of anthropology. He travelled extremely widely for a man of his time, from the Black Sea to Aswan in Upper Egypt, and from Sicily to Cyprus. His *Histories* mention more than 50 different tribes or “nations”, including lengthy descriptions of the Egyptians and the Scythians. He did not stay long in these various places; he was more like a tourist than an ethnographic fieldworker. What distinguished him from earlier historians and mythographers was his application of a rationalist approach, which he called *historia*, literally “research, inquiry” – the very same term the early philosophers used to describe their investigations of nature. He would compare accounts and reject the less likely, or register his own scepticism. As he demurs at one point, “For myself, my duty is to report all that is said, but I am not obliged to believe it all.”

Herodotus approached the study of society with distinct categories and questions in mind. He operated according to an implicit social theory that led him to scrutinize descent, language, and religion as the criteria that distinguished one group from another. In his accounts of specific groups he tended to emphasize marriage customs, religious rites, burial practices, and food habits – categories that would shape subsequent ethnographic thought throughout the Middle Ages. The pole of comparison of these various forms of life was, of course, the 5th-century Greek world. In kinship and marriage, for example, the Greeks were patriarchal and patrilineal, and this made for comparative interest in the Lycians who reckoned descent matrilineally, or in the Massagetae who were promiscuous, or the Issedonians who ate their dead parents, but treated their wives as equals.

Herodotus’ rational historical method tended to break down in the description of peoples inhabiting the limits of the known world such as the Issedonians. His report that in India there was a tribe “that will not take life in any form; they sow no seed, and have no houses and live on a vegetable diet” apparently contained a kernel of truth. Yet in other passages he wrote of people with feet like goats and others who slept half the year. The Roman imperial historian Pliny continued this exoticizing of peripheral peoples, expanding Herodotus’ inventory of ethnological curiosities to include the Gamphastes who went naked and practised non-violence, and the headless Blemmyae whose eyes and mouths were set in their chests. These and other fantastic stories found their way on to medieval maps and influenced the perception of the world until the age of exploration.

The 16th and 17th centuries not only brought Europe into contact

with hitherto unexplored parts of the world, it was also the period of the rebirth of humanistic interest in ancient Greece. One result of this historical coincidence of philological and geographical exploration was the appearance of books comparing the institutions and values of the ancients with those of contemporary “savages” in the newly colonized world. The French missionary Joseph-François Lafitau’s 1724 volume comparing native North Americans to the Greeks and Romans was just one example of this trend. In addition to his primary interest in religion, Lafitau collected correspondences in domains such as government, family organization, education, and the gendered division of labour. The general conclusion that Lafitau and his contemporaries drew from this kind of research was that native Americans and the people of Classical antiquity must have sprung from one and the same source.

The chronological and evolutionary specifics of the relationship between contemporary inhabitants of small-scale societies and the ancients were further worked out in the 19th century. The view of high Victorian anthropology drew heavily on the ideas of evolution and progress. For E.B. Tylor, who became the world’s first professional anthropologist upon assuming a readership at Oxford in 1884, all humans possessed the same mental equipment but some had developed faster and further than others. He divided humanity into three stages: savagery, barbarism, and civilization. The Britain of his day exemplified the last stage, and he and his countrymen could look at small-scale societies in places like Africa and Melanesia, or ancient societies in Greece or Rome, to see what they had once been like. Savagery was characterized by “animism” – the idea that spirits and supernatural beings animated and controlled the natural and human worlds. Homeric descriptions of the souls of warriors departing through their mouths at death could be compared with similar beliefs among peoples of the Malay archipelago. Tylor also considered that isolated elements from earlier stages of humanity could filter through to civilized societies as “survivals” – little irrationalities and superstitions like saying “Bless you!” when someone sneezed.

One of the goals of Tylor’s follower, Sir James Frazer, was to identify and extirpate these survivals, thereby paving the road to progress. Frazer’s multivolume work *The Golden Bough* (1890– 1915) exhaustively catalogued and compared beliefs in fertility, death, and resurrection held by ancient societies, contemporary “primitive” societies, and even European peasants who, it was thought, had not been touched by “civilization”. Frazer was an accomplished Classical scholar and his cross-cultural ethnographic learning also found its way into his six-volume commentary on the Greek traveller Pausanias. His influence touched the turn-of-the-century “Cambridge Ritualist”

school of Jane Harrison, F.M. Cornford, and others, who made ample use of cross-cultural materials in presenting their arguments about the priority of ritual to myth in ancient Greek society.

Beginning with Bronislaw Malinowski in the 1920s, fieldwork, involving a residence of a year or more among the people under study, became the standard method of data collection in anthropology. During this time the anthropologist was expected to learn the language of the group under study and attempt, through the method of “participant observation”, to capture “the native’s point of view”. Malinowski eschewed the hypothetical historicism of his Victorian predecessors. Societies were to be explained by his functional theory that emphasized how institutions enabled people to adapt to their environment and maintain social harmony in the present.

Malinowski’s revolution spelled the end of the comparative, evolutionary, anthropological interest in ancient Greece that had flourished since the Renaissance, and it was not until after World War II that a variety of new approaches began to emerge. In 1955 Claude Lévi-Strauss published his essay on “The Structural Study of Myth” in which he applied his structuralist method to the myth of Oedipus. This called for a solid ethnographic knowledge of the society and the region whose myths were being considered. Lévi-Strauss was no specialist on ancient Greek culture and he even admitted in the course of his essay that Oedipus was “an arbitrary example, treated in an arbitrary manner”. His structuralist method, however, was later to prove fruitful in the hands of the French Classical scholars Jean-Pierre Vernant and Marcel Detienne who produced stunning analyses of the cult of Hestia and the myth of Adonis respectively. These analyses depended upon detailed knowledge of Greek domestic space arrangements, ideas about gender, sexuality, and the symbolic associations of herbs and spices, to name just a few cultural categories.

Another postwar development was the general application of anthropological theories to illuminate Classical Greek values and institutions. The classicist E.R. Dodds (*The Greeks and the Irrational*, 1951) borrowed the American anthropologist Ruth Benedict’s distinction between shame and guilt cultures to differentiate the Homeric world, where public appearances counted most, from the world depicted by the Classical tragedians, where actors were riven by internalized dilemmas. In another novel departure the ancient historian M.I. Finley applied the economic anthropological theories of Mauss and Polanyi to the understanding of ancient Greek gift giving, friendship, and trade (*The World of Odysseus*, 1954). From this point onwards anthropological theories and comparative examples have

featured prominently and regularly in major works such as Walter Burkert's study of Greek sacrifice (*Homo Necans*, 1983) or James Redfield's study of social values in Homeric epic (*Nature and Culture in the Iliad*, 1975).

The study of modern Greek societies through ethnographic field research represented another important mid-20th-century departure. Up until this moment modern Greek village life and traditional beliefs had been the province of folklorists and travellers from the 19th century and earlier. Scholars such as John Cuthbert Lawson and Nikolaos Politis were primarily interested in discovering survivals of ancient culture in modern Greece. Although roughly contemporary with the British Victorian anthropologists mentioned above, these folklorists took an entirely different view of survivals. In their view survivals added to knowledge about the revered ancients while also furnishing documentary evidence that the modern Greeks really were valid descendants of the ancients. This was an important national issue for the Greek state after nearly 400 years of Ottoman domination.

The new generation of anthropologists were not concerned with these issues, but rather with Malinowski's programme of rendering a holistic account of the community under immediate study. The American anthropologist Ernestine Friedl presented a monograph (1962) describing life in a Boeotian farming village that considered issues of tradition and modernity. And John Campbell published an account (1964) of the Sarakatsani, a transhumant group of pastoralists in Epirus. Campbell's study was the first full-length exploration of a cognatic kindred, a system where descent is reckoned through both parents. More theoretical focus was given to early anthropological research in Greece by John Peristiany, arguably the first Greek anthropologist to emerge after Herodotus. Peristiany conducted fieldwork in his native Cyprus and edited an influential volume entitled *Honour and Shame: The Values of Mediterranean Society* (1966) that drew together studies documenting a pan-Mediterranean set of complementary values. Men in these societies were held to possess "honour" – the ability to protect one's immediate kin, property, and good name. Women, on the other hand, possessed "shame" – the obligation to conduct themselves with modesty.

Once thought to be the key to understanding Greece, and all Mediterranean societies, the honour and shame complex has been criticized as too rigid. Current research in Greece has moved on to consider the fundamental duality in modern Greek social identity between Classical/western and Ottoman/ eastern alternatives – between Hellenism and *Romiosyni*. Among themselves, contemporary Greeks may acknowledge the Ottoman influences on their culture and

speaking in affectionate, expressive terms that contain numerous Turkish-derived words. For purposes of self-presentation to outsiders these features are downplayed and links with the ancients are emphasized. In such situations more vocabulary may be selected from the *katharevousa* register, a version of modern Greek invented in the 19th century and designed to purge the spoken language of Turkish and Balkan elements. The performance of Greek identity thus involves constant code-switching between Hellenic and Romaic registers.

One consequence of the florescence of anthropological research on contemporary Greece and Cyprus is that Classical historians may now draw on these data to inform their reconstructions of earlier communities in the very same regions. Archaeologists have exploited this situation to make advances in the area of ethnoarchaeology. In order to further their understanding of ancient Greek subsistence and seasonal work patterns, for example, they may conduct field research among contemporary farmers and shepherds to gain an idea of how much grain a hectare of land normally yields, or how much milk a flock of sheep and goats can provide.

The orientation of this research is paralleled in the work of historians such as David Cohen who argue that the honour and shame complex identified through anthropological research in Greece may deepen the understanding of public morals in Classical Athens. Since independence in 1832 the Greek state, supported by folklorists and foreign travellers, has asserted that it continues the rational and sophisticated traditions of the ancients. Lying, vendettas, and the practices of remote agriculturalists probably did not figure in the state's initial vision of claimable survivals. An unintended consequence of this new research is that the ancient Hellenes now resemble *Romii avant la lettre* and contemporary practices hitherto disparaged as Romaic can now be confidently claimed as Hellenic.

The anthropology of Greece has come full circle in one other respect. Anthropological practice underwent critical re-examination in the 1980s resulting in greater sensitivity to the issues of representation and reflexivity. In principle this meant that more space should be given to representing the unmediated statements and opinions of the people under study, even to the point of making them co-authors of the ethnography. Reflexivity called for the anthropologists to include more information on their personal experiences and feelings in the field. These theoretical developments coincided with the establishment of social anthropology as an academic discipline in Greek universities. Increasing numbers of Greek anthropologists are now undertaking extensive field research in Greece. This rise of an indigenous anthropology offered one solution to the "crisis of representation". Greek anthropologists such as Neni

Panourgíá, Nadia Seremetakis, Evthymios Papataxiarchis, and Vassos Argyrou have been able to utilize their total linguistic competence and relative insider status to offer striking accounts of death as experienced within an Athenian family, funeral lamentation in Mani, patterns of drinking and friendship on the island of Lesbos, and champagne as opposed to “traditional” weddings in Cyprus respectively. Public debates have centred on whether these indigenous anthropologists can render more valid accounts of Greek society. The preliminary verdict seems to be “no”; there are likely to be as many different anthropological accounts of a given society as there are anthropologists.

Antigonids

Dynasty of Macedonian kings

With the death of Alexander the Great in 323 BC and the murder of all the members of his immediate family within the following 30 years, the Argead dynasty of Macedonian kings (of which Alexander was a member) was extinguished. The throne of Macedonia was vacant and

briefly occupied by various contenders, creating a political situation of great turmoil and instability. Only when Antigonus Gonatas secured the throne around 277 BC, held it for nearly 30 years, and sired a son who inherited it, can we speak meaningfully of the Antigonid dynasty of kings of Macedonia, but their roots in Macedonian history go back for more than half a century.

The grandfather of Gonatas was Antigonus Monophthalmus (the “One-Eyed”), who was a general throughout the Asian expedition of Alexander the Great. After Alexander’s death, he was declared “general” (in Greek *strategos*)—essentially supreme commander—of all Asia, which gave him great power and control over a vast territory. Throughout the next 20 years Antigonus fought to consolidate his position and extend his power at the expense of the other successors of Alexander. At the period of his greatest successes, it might be argued that he came closest to recreating Alexander’s kingdom. After some notable military victories, he declared himself and his son Demetrius “kings” in 306 BC. Although they were “kings” without a kingdom in geographical terms, this joint claim suggests that Antigonus intended to establish a hereditary line of rulers.

Antigonus Monophthalmus died on the battlefield of Ipsus in 301 BC, facing a coalition of the other successors. His son Demetrius Poliorcetes (“the Besieger”), who had already acted as Antigonus’ roving general throughout Greece and Asia, inherited his father’s ambitions. He interfered in the politics of mainland Greece, subdued Athens for a time, and was briefly declared king of Macedonia. In 293 BC Demetrius founded by synoecism a new city, Demetrias, near the site of Classical Pagasae (in turn near the site of Bronze Age Iolcus, from where the legendary Jason set forth on his journey to find the Golden Fleece) in the Gulf of Volos, a few kilometres from the modern city of Volos. In 285 BC, in the course of attempting to recover his father’s Asian possessions, Demetrius was captured by Seleucus I of Syria and died in captivity two years later.

Antigonus Gonatas, the son of Demetrius and his wife Phila (the daughter of Antipater, the regent of Macedonia during Alexander the Great’s absence), immediately took the title of king and entered the fray for the throne of Macedon. He finally secured it around 277 BC. His long reign saw the Chremonidean war in the 260s BC, when Athens and Sparta tried unsuccessfully to overthrow Macedonian control, and naval victories over the Ptolemies at the battles of Cos and Andros (usually placed in the context of the Chremonidean war). Gonatas died in 239 BC, having outlived all his royal contemporaries. Although his control over mainland Greece was insecure and he had been threatened in Macedonia, he reestablished Macedonia as a nation and made it a kingdom to be ruled by his descendants. On the cultural

side, Antigonus had been a pupil of the philosophers Menedemus of Euboea and Zeno of Citium, and his court at Pella was a centre for writers and scholars, among them the historian Hieronymus of Cardia (author of the most reliable account of the decades after the death of Alexander the Great), and the poets Aratus of Soli and Alexander Aetolus.

Gonatas' son Demetrius II had probably been acting as the king's general during much of his father's long rule, but his defence of Macedonia against an Epirot attack at the time of the Chremonidean war is his only known action. He fought a war against Aetolia and the anti-Macedonian Achaeans around 238 BC, and was killed fighting the Illyrian Dardani tribe on the Macedonian frontier in 229 BC, leaving an eight-year-old son, Philip, to face the barbarian threat and the consequences in Greece of a weakened Macedonia.

The boy king Philip V was placed in the care of a regent, Antigonus Doson, a grandson of Demetrius Poliorcetes from one of his minor marriages. Antigonus proved a blessing to the threatened Macedonia, and his loyalty to the young Philip remained unshaken even after he was himself granted the throne around 227/26 BC (thereby becoming Antigonus III). Doson defeated the warlike Dardani tribe, and turned his attention to the south and east. He defeated the Aetolians and Thessalians in 228 BC, and made an expedition to Caria in 227 BC (the circumstances, cause, and purpose of this adventure remain obscure). His chance to re-establish Macedonian influence in mainland Greece came at the surprising request of the usually anti-Macedonian Aratus of Sicyon (the head of the Achaean League) for help in the Peloponnese against the aggressions of Sparta and Aetolia. Doson readily agreed, and was formally offered the citadel of Acrocorinth (which dominated the Isthmus of Corinth) in return for his military support in 225–24 BC. Corinth was occupied by a Macedonian military garrison, and Doson pushed back the threatening Spartan king.

One of the most important acts of Doson's reign was the foundation in 224 BC of the so-called Hellenic League, an alliance of existing Greek federations under Macedonian hegemony. The various federations were to be internally autonomous but interdependent with respect to foreign policy. The foundation of the Hellenic League was potentially significant because Greece was shortly to face the power of Rome, and it is a landmark in the history of federalism. Unfortunately, Doson's premature death prevented the fruition of his plans having real effect. After recovering Arcadia in 223 BC and defeating the Spartan king Cleomenes III at the battle of Sellasia (just north of Sparta) in 222 BC, he returned to Macedonia to face another Illyrian invasion. A burst blood vessel in his lungs worsened his already weak health, and he died some months later in 221 BC, having provided for the education of

his charge Philip V by sending him to Aratus of Sicyon, Macedonia's recent ally, to learn about Greek affairs.

The accession of Philip V as an independent monarch marks the beginning of the end for an independent Macedon, due to its involvement with a now very powerful Rome. Philip was still a teenager when his regent Doson died, but he was immediately plunged into the so-called Social War in which he and the newly founded Hellenic League faced Aetolia and its allies. The war lasted from 220 to 217 BC, and marked Philip's growth into a mature king. He gradually turned away from his new mentor Aratus and towards the camp of an Illyrian dynast named Demetrius of Pharos (the island of Hvar in modern Croatia) in the Adriatic Sea. Rome had rewarded Demetrius with the rule of this petty state when he delivered Corcyra (modern Corfu) into Roman hands, but his various aggressions in the Aegean caused Rome to expel him in 219 BC, and he escaped to Philip in Macedonia nursing a major grievance. Demetrius encouraged Philip's alienation from Aratus and the Achaean League and continually incited him against Rome, in the first instance against the Romans in Illyria. Furthermore, Philip's treaty with the Carthaginian general Hannibal was the death-knell of any hope of friendship with Rome.

The First Macedonian War between Macedonia and Rome began in 214 BC, and soon Rome forged an alliance with Aetolia against Philip. The war began inauspiciously for Philip, with various disasters in the Peloponnese, an ultimate break with Aratus, and the forced burning of his fleet, but his superior forces on land, combined with Roman inaction at critical periods, forced terms on Aetolia in 206 BC. The First Macedonian War was ended by the Peace of Phoenice (a city in Epirus, now in modern Albania), proposed by Rome in 205 BC and favourable to Philip.

Philip turned his attentions eastward, colluding in 203/202 BC with Antiochus III to divide Egypt and experiencing a naval defeat off the island of Chios in 201 BC at the hands of the combined Rhodian and Pergamene fleets. Fearing Philip's intentions, Rome declared the Second Macedonian War in 200 BC. Campaigns were fought in Greece, Thrace, Macedonia, and Thessaly, sometimes with notable successes for Philip, until in desperation Rome appointed Titus Quinctius Flamininus to the command in 198 BC. Under his leadership, in 197 BC the Romans decisively defeated Philip's forces at the battle of Cynoscephalae in Thessaly. Harsh military and financial terms were imposed upon Macedon, and Philip's elder son Demetrius was taken as a hostage to Rome.

Confined to Macedonia as part of the peace terms, Philip concentrated on rebuilding his country. He was now perforce an ally

of Rome, albeit an uneasy one, and he had to be seen to support it – which he did against the usurper Nabis of Sparta, Antiochus III, and Aetolia. Rome remained suspicious of Philip, rightly so in view of his aggressive policy in the Balkans after 185 BC (defeating various Thracian tribes, resettling some, and making alliances with others). Philip, probably with the connivance if not the encouragement of his younger son Perseus, engineered the death of his pro-Roman son Demetrius after he was freed from his Roman sojourn, and secured the succession for Perseus, who shared his imperialist tendencies. On a tour of his kingdom in 179 BC, Philip V died of sickness at Amphipolis.

Upon his accession to the throne, Perseus renewed his treaty of friendship with Rome, but carried on his father's policy of consolidating Macedonia. He furthermore made a convenient dynastic marriage to Princess Laodice, daughter of Seleucus IV of Syria. Complaints by Eumenes II of Pergamum in the Roman Senate about Perseus' growing power led to the declaration of the Third Macedonian War in 171 BC. Macedonian advantages in the early years of the war were ended by the appointment of the Roman general Lucius Aemilius Paullus to the command in 168 BC. The Roman forces utterly defeated Perseus at the battle of Pydna (on the east coast of Macedonia south of Thessalonica) in 168 BC. Perseus fled to Samothrace but finally surrendered to the Romans. He and his children were taken captive to Rome, paraded in chains in Paullus' triumph, and the king – the last of the Antigonids – died in a Roman prison shortly thereafter. Macedonia was sacked of all of its wealth and its people were treated harshly. The royal kingdom was abolished, and the country was divided into four republics with elected officials who operated under Roman supervision. A pretender to the throne, Andriscus from Adramyttium in the Troad, claimed to be the son of Perseus, and raised some support for his cause. He had some military successes c.153–148 BC but was defeated by the Roman general Q. Caecilius Metellus Macedonicus, captured, paraded in triumph at Rome, and executed. Macedonia became a full province of Rome in 146 BC.

The Antigonids re-established Macedonia as a nation after the years of Alexander the Great's absence, the decades of chaos after his death, and the extinction of the Argead dynasty. Under their rule, the country gradually regained its prosperity after the severe depletion of manpower occasioned by the removal of some 40,000 men in their prime to accompany and reinforce the expedition of Alexander the Great. The wealth of Macedonia could not perhaps compete with that of the Ptolemaic and Seleucid empires, but the amount that was removed by the Romans (attested in literary sources) shows that the Antigonid kings could hold their own among other Greek monarchs.

However, it was the serious mistakes in judgement by the later Antigonid kings regarding the level of Rome's interest in the Greek east and its ability to carry out its policy that led Macedonia to lose its independence and became the first of the Hellenistic empires to fall under Roman control.

Antiochus III the Great c.242–187 BC

Seleucid king

Antiochus III the Great was the sixth king (223–187 BC) in the Seleucid dynasty and the greatest ruler in the dynasty since Seleucus I (c.355–281 BC), the founder of the empire. Son of Seleucus II, he succeeded his elder brother Seleucus III on his assassination in 223 BC. The epithet “great” (*megas*) was probably taken by the king around 204 BC as the result of his eastern expedition of 212–205 BC, though it was subsequently dropped in favour of the title “great king Antiochus” (*basileus megas Antiochos*) that he assumed in 200 BC after his conquest of Coele Syria from Ptolemy V. The title asserted Antiochus’ claims over the rule of Asia, following the Persian kings and Alexander the Great, and his superiority over his rivals the Ptolemies, who had claimed the title for themselves.

The best ancient account of Antiochus’ reign is that of Polybius, but it is fully preserved only down to 217 BC and is fragmentary thereafter. Polybius must have drawn his information from one or more writers contemporary with the king, though who these were is uncertain. For the story of Antiochus’ conflict with the Romans in the 190s BC down to the Treaty of Apamea in 188 BC reliance must be placed on Appian (*Syriake*, 1–44) and Livy (33–38); though derived in part from Polybius, these accounts are written from a Roman, not a Seleucid, perspective, and may not reproduce fully the Polybian original. In addition a large number of Greek inscriptions, chiefly from Asia Minor, provide important information on Antiochus’ relations with the Greek communities there.

Antiochus came to power at a young age and in difficult circumstances, but he gradually asserted himself and went on to restore and extend the Seleucid empire as no previous king since Seleucus I had done. A rebellion in the eastern provinces led by Molon, the satrap of Media, who took the royal title, had to be put down (222–220 BC). Achaeus, a relative of the king in charge of Asia Minor from his capital at Sardis, proclaimed his independence and took on the royal title (220 BC), and was not eliminated until 213 BC. A war against Ptolemy IV of Egypt (219–217 BC) resulted in defeat at the battle of Raphia in Palestine, though Antiochus regained control of Seleucia in Pieria. From 212 to 205 BC Antiochus undertook a grandiose expedition to the east (the *anabasis*), perhaps in emulation of Alexander the Great, in which he brought Commagene and Armenia under control, sought to restore Seleucid dominance over Parthia and Bactria (though he was unable to dislodge the ruling king Euthydemus, with whom he made an alliance), and renewed links

with India. On his return he made an expedition to the Persian Gulf, though he had to accept the continued independence of the trading city of Gerrha. After an incursion into Asia Minor (204/03 BC) he turned his attention to the successful conquest of Coele Syria, Palestine, and Judaea from Ptolemy V (c.202–198 BC). He then moved into Asia Minor to restore Seleucid rule over the Greek cities there, and into Thrace with the object of rebuilding Lysimachea, previously under Seleucid control (197/96 BC). His advance led him into contact with the Romans, who had defeated Philip V of Macedon at Cynoscephalae (197 BC) and had proclaimed the “freedom of the Greeks” at the Isthmian festival (196 BC). Misunderstandings and suspicions developed between both parties as to their respective intentions, and it is not easy to determine the responsibilities for the conflict that eventually broke out when Anti-ochus landed on the mainland of Greece posing as a champion of Greek freedom against the Romans (192 BC). Expelled by the Romans from Greece (191 BC), Antiochus was then defeated by them at the battle of Magnesia in Lydia (190/89 BC). By the Treaty of Apamea (188 BC) he was forced to evacuate all lands to the north of the Taurus, reduce his military forces, pay heavy war indemnities, and provide hostages. Significantly reduced, the Seleucid empire remained nevertheless powerful and wealthy. Antiochus himself was killed soon after on an eastern expedition (187 BC) while pillaging a temple of Bel in Elymais.

Antiochus’ reputation in the extant sources is very mixed. Polybius found fault in the king’s early years when the young ruler lacked authority and experience, though he praised his conduct and achievements in the eastern expedition. He denounced the secret pact that Antiochus allegedly made in 203/ 02 BC with Philip V to partition the possessions of Ptolemy V. He accused the king of failing in his later years to live up to the promises of his early reign, and thought he had mishandled the campaign against the Romans. The presentation in Livy and Appian of Antiochus’ role in the war against Rome is negative. The king is credited with aggressive intentions against Rome, and with mismanaging the war. Roman propaganda also presented him in the guise of an “oriental despot”, a second Xerxes invading Greece who was repulsed and defeated by the Romans.

Little is known of the personality of Antiochus (the same is true of most of the kings in the dynasty), though many of his known actions suggest a ruler of exceptional ambition. At some time in his reign (before 193 BC) he instituted a divine cult of himself and his ancestors which was organized on an empire-wide basis, and to which he added (193 BC) a similar cult of his first wife, the Pontic princess Laodice whom he had married in 222 BC. No previous or subsequent Seleucid ruler is known to have done this. He made extensive use of dynastic

marriages in his imperial designs, and it is to his reign that belongs the only recorded instance of brother-sister marriage in the dynasty (his eldest son Antiochus was married to his daughter Laodice). On the other hand Antiochus was not a great city founder, unlike Seleucus I and his son Antiochus I, and this affected his subsequent memory. His inglorious end after defeat at the hands of the Romans obscured the memory of his earlier achievements and leaves the historian with an unresolved enigma.

Biography

Born c.242 BC, Antiochus succeeded his elder brother Seleucus III in 223. He assumed the title “great” probably in 204, but dropped it in 200 in favour of “great king Antiochus” asserting his claims over Asia. He considerably expanded the territory of the Seleucid empire, but was defeated by the Romans at Magnesia in 190/89 BC. He died fighting in 187 BC.

Antiquity, Reception of

Hellenic culture is the product of a complex and sometimes problematic relationship with its ancient past, cultural and linguistic. From late antiquity to the modern era an emphasis on continuity with the Classical tradition has been seen as a way of maintaining and expressing ideals of Hellenic identity and unity, marked particularly when these ideals have been perceived as being under threat from “alien” hegemonies – the Roman empire, the Tourkokratia – and in times of national reunification and reinvention.

In antiquity itself the Greeks cherished and derived inspiration from their cultural heritage and sought to gain prestige through establishing ancestral connections, communal and personal, with the gods and heroes of myth. It was the Greek writers and scholars of the Hellenistic world and the early Roman empire, however, who laid the foundations for subsequent attitudes to antiquity in the Greek-speaking world. The intensive scholarly enterprise of the Hellenistic age, focused around the great libraries – particularly that of Alexandria where the gathering and editing of ancient texts and fragments were prioritized as the proper object of academic energy – not only preserved the culture of high antiquity for the future but also provided a model of activity for later scholars. This retrospection extended to the Alexandrian literati who displayed their erudition in sophisticated treatments of esoteric myth and a familiarity with earlier genres, dialects, and metres; following the Hellenistic model, the notion that the literature and language of earlier antiquity were the proper exemplars became a standard for later writers.

The Greeks of the early Roman empire exhibited a more pronounced nostalgia for the past; the literary renaissance of the 2nd and early 3rd centuries AD, dubbed the Second Sophistic by Philostratus, was informed heavily by the culture of Classical Athens (designated as the First Sophistic). The orators Herodes Atticus and Aelius Aristides took Classical rhetoric as their model; the travel writer Pausanias sought to describe Greek culture before the Roman conquest; while Phrynichus produced a lexicon of “correct” vocabulary predicated on Classical usage and the notion of ancient Greek as a linguistic and cultural ideal. This “Atticism”, a Classicizing and archaizing written style distinct from the developing spoken Greek language, became a marker of the educated elite and a potent ideological symbol of the continuity between past and present which persisted through the Byzantine period and into the 20th century.

The Greek language which had become the koine of the Hellenistic world remained the lingua franca of the Byzantine empire, an important factor in the reception of antiquity by Byzantine writers and scholars, for whom the literary tradition of ancient Greece was

central. Writers of the 5th and 6th centuries AD were well acquainted with the literature of antiquity and this familiarity informed their own work: Homer and Aristotle were particularly important exemplars, while Procopius in the early 6th century was influenced by Thucydides and Herodotus and wrote in the language of his Classical models. The problematic 7th and 8th centuries represented a hiatus in Byzantine literary enterprise, but from the late 8th century the focus of scholarly interest was the reaccumulation and re-editing of the ancient texts and fragments that had been lost in the preceding period; the 9th and 10th centuries saw the production of the *Suda* and Photios's *Bibliotheca*. In the 7th–11th centuries Roman rather than Hellenic antiquity provided the literary model for Byzantine writers, although the copying of Classical texts and scholia continued. In the mid-11th century, however, there was a renaissance of interest in the culture of ancient Greece during the reign of Constantine IX Monomachos. Classical Greek texts were revered particularly, and the Classical revival was marked by a resumption of scholastic endeavour. Noted Classical scholars such as Michael Psellos and John Italos in the 11th century and John Tzetzes and Eustathios of Thessalonica in the 12th did not confine themselves to the copying and editing of ancient manuscripts but became the self-appointed exegetes of the Classical tradition, writing essays and commentaries in a broadly “Classical” style, albeit from a Byzantine perspective, and using ancient texts to reflect upon contemporary and often ecclesiastical issues. During the Palaiologan period (13th century on) there was a revival in Classical philology and many Greek texts owe their survival to the efforts of Planudes in the 13th century and Triklinios in the 14th. Yet antiquity did not have a monopoly of influence upon the Byzantine literati; the histories of Anna Komnene demonstrate a high Attic style but take the Second Sophistic and late antiquity as models as well as the Classical period, while in the Palaiologan period Byzantium was influenced too by the literature of the medieval West, and much of the religious literature of the empire – in particular the hagiographies and hymnographies – owed nothing to the ancient tradition.

There existed within the Church an equivocal attitude towards the culture of antiquity. From the time of Constantine the term Hellenic (*Hellenikos*) was equated with paganism and was construed as a rival to Christianity; the Church preferred the plainer koine to the “pagan” high Classical style of secular literature and repudiated the polytheism and “immoral” gods of ancient mythology. Indeed in the 10th and 11th centuries any involvement with the myth and philosophy of antiquity invited the charge of anti-Christian behaviour; long ago Justinian had tried to suppress the philosophical schools at Athens, and in the mid-11th century the Platonic and Neoplatonic researches

of John Italos were denounced as heretical. Yet paganism proved difficult to eradicate: the cult of Dionysus in particular gathered strength in the period of late antiquity, as evidenced by Nonnus' epic *Dionysiaca* of the mid-5th century, while Christian converts used the mythical iconography of ancient Greece in their churches and incorporated elements of the outlawed pagan worship into the new religion. Furthermore, the literature, philosophy, and rhetoric of Greek antiquity were integral to Christian thought and education: the distinction between the repudiation of Hellenism as paganism and a reverence for the secular literature of Hellenic antiquity was an uneasy one.

The 19th century saw the coincidence of two factors that were highly significant with regard to the reception of the Classical tradition – the revival of Classical scholarship in Europe and the emergence of an independent Greece. The influence of European interest in Greece and the many important archaeological finds impressed upon the Greeks the value, artistic, historical, and commercial, of their past. A series of measures that aimed to preserve the Greek heritage were taken in the first half of the 19th century: in 1826 the provisional government issued a decree for the protection of antiquities, and three years later the fourth National Assembly at Argos prohibited their export, and the first archaeological museum in Greece was founded at Aegina. However, many important artefacts had been taken already, for example the friezes from the Parthenon and Bassae, still in London, and the sculptures from the temple of Aphaea on Aegina, now in Munich. The recovery of antiquities is still a political issue in Greece and a focus of national pride.

When the seat of the new government was moved to Athens the city was rebuilt in the Neoclassical style, and between 1834 and 1837 the Acropolis was “cleansed” in an attempt to restore the purity of the Classical past. Indeed, an emphasis on cultural continuity and “purity” became the keynote for a Greek nation that had survived Ottoman domination and its concomitant cultural and linguistic “contamination”: Greek identity was to be reconstructed on the foundations of ancient Hellenism and the image of a new philhellenic Greece entering a new Periclean age. The literature of the period is indicative of this classicizing enterprise: Konstantinos Paparrigopoulos's *History of the Greek Nation* (1860–72) stressed the continuity of Greece from antiquity to the modern era; Adamantios Korais (1748–1833) edited a series of Classical texts, and Philippos Ioannou composed verse in Classical metres – the emphasis was on the perpetuation of the Classical tradition and an archaizing purity of language. Classical studies became the basis of education (as indeed was the case throughout Europe); the University of Athens, founded in

1837, emerged as a bastion of linguistic archaism while the syllabus laid down for the “demotic” schools in 1883 concentrated on the rote learning of Classical texts and the study of ancient Greek.

One primary educational and political concern was the question of a national language; the members of the new Greek state spoke a variety of dialects and languages, including Turkish, and the notion of the standardization of Greek and what form it might take occupied thinkers and politicians for much of the 19th and 20th centuries. One school of thought held that the national language should reflect the tradition of ancient Greece and Byzantium and that Greeks should speak the language of antiquity or at least a “corrected” form of contemporary Greek. In the view of such “archaizers” a knowledge of ancient Greek would give the people access to their cultural inheritance and the translation of ancient texts into the vernacular represented a degradation of the past. Contrarily, others argued that the national language should reflect contemporary Greek linguistic practice and culture. For these “demo-ticizers” ancient Greek was incomprehensible to ordinary people and its study was available only to the privileged few; thus the prioritization of the learned Greek of antiquity over the modern, demotic language was an elitist anachronism, a socially divisive programme that would separate the people from their heritage. The translation of ancient texts and the performance of ancient drama in demotic Greek was supported in particular by Kostis Palamas (1859–1943); however, feelings regarding the “bastardization” of ancient culture ran so high that a performance in 1903 of Aeschylus’ *Oresteia* in a vernacular translation resulted in a riot. The “language question” has informed the political ideology of both left and right and has persisted well into the 20th century; while the Venizelos government introduced the teaching in schools of demotic Greek in 1917, it was not until the Education Act of 1976 that it was decided that the language of education should be modern Greek.

Many modern writers have felt that an artificial “corrected” form of Attic Greek and a “fossilizing” approach to ancient culture are not only reactionary but also a bar to poetic creativity – Dionysios Solomos (1798–1857) in particular was a champion of demoticism, and the vernacular is now the literary as well as the spoken norm. However, much modern Greek poetry is informed and inspired by antiquity: Solomos, while imbued by the Italian tradition, was influenced by Platonism, as was Palamas. Angelos Sikelianos (1884 – 1951) too was interested in Plato and in ancient mystery religions, while the “historical” poems of Constantine Cavafy (1863–1933) are set in Hellenistic Alexandria and Byzantium. Yet perhaps the cultural genre of antiquity that appeals most to the contemporary cultural

imagination is 5th-century BC drama. There have been many European productions of Greek tragedies from the 16th century on throughout Europe (see Burian, 1997), nearly all of them in languages other than Greek, but during the 20th century in particular there has been a revival of interest in the drama of antiquity in Greece itself and a reintroduction of the ancient notion of the dramatic festival: in the 1920s Sikelianos instituted a cultural festival at Delphi, staging Aeschylus' *Prometheus Bound* and *Suppliant Women*, and in the mid-1950s festivals of ancient drama were instituted at Epidauros and at the Odeum of Herodes Atticus in Athens. Some modern productions have aimed at authenticity; Sikelianos derived the costumes and movements of the chorus from ancient vase paintings for his staging of Aeschylus, while the film maker Michalis Cacoyannis's *Trojan Trilogy* (1961–76) used ancient sites and costumes. However, tragic performances by Karolos Koun's Theatro Technis are informed by modern Greek rituals and there have been several modern treatments of ancient drama that not only use contemporary settings but also use the narratives of antiquity to explore contemporary issues. Jules Dassin's screen adaptation of Euripides' *Hippolytus* (1961) is a critique of Greek high society – Theseus is transformed into a shipping magnate; Hippolytus dies not in a chariot but in an Aston Martin; and Phaedra, played by Melina Mercouri, overdoses on sleeping pills. More recently the fratricide and divided loyalties of Sophocles' *Antigone* were staged by Nikos Koundouros in the no man's land between northern Greece and the former Republic of Yugoslavia.

Translations of ancient texts into modern Greek and new media such as film have engaged a wider audience. Poets, theatre directors, and film makers have taken antiquity out of the museum and classroom and into a wider public arena, reinstating ancient literature and thought as part of the living tradition of Greece and as an integral part of contemporary Hellenic culture. Yet while an engagement with antiquity may be a source of inspiration to its inheritors, the achievements of the past may also provoke what has been called the “anxiety of influence”: in the Palaiologan period the scholar Theodore Metochites complained that there was nothing left to say – the ancients had said it all; in the 20th century George Seferis, for whom Greece's ancient ruins signified the sterility of the modern imagination, intimated that the sheer weight of a glorious cultural inheritance could be a burden as well as an inspiration: “I awoke with this marble head in my hands” (*Mythistorema*, 3).

Apelles

Painter of the 4th/3rd century BC

Apelles was the most celebrated and the most written-about painter in antiquity, yet we know neither his date of birth nor his date of death. However, his likeable and colourful personality, his rivalries with

others, and his special relationships with the most powerful men of his day have generated many anecdotes about the man, the artist, and his works. He attained remarkably high social and economic status, and wrote treatises about his painting. Unfortunately, neither his writings nor his famous creations survive. All we have are anecdotes, the mention of more than 30 titles of his works, perhaps a few very vague and suspect reminiscences in Roman paintings, and a few elaborate literary descriptions, the last of which formed the basis for attempted recreations of his works by Renaissance artists.

Born sometime around 370 BC, in either Cos or Colophon, Apelles first trained in the Ionic school under Ephorus of Ephesus. He then moved to the Greek mainland, paying a large sum for the privilege of becoming the student of Pamphilus, the master of the Sicyonian school. Combining the grace of the Ionic style with the thoroughness of the Sicyonian school, Apelles attained a reputation that by c.340 BC was sufficiently prominent to gain him entry to the court of Philip II in Macedonia, where he painted portraits of the ruler and his court. During the reign of Alexander the Great, Apelles' affable nature and abilities as a painter advanced him to the point where the ruler made him his official portraitist. Apelles joined the ranks of the sculptor Lysippus and the engraver Pyrgoteles as the only artists officially allowed to depict Alexander. The latter was attempting, it seems, to develop his official portraiture, and to control the quality, and messages conveyed by, his images.

Apelles' easy relationship with Alexander and his associations with other powerful rulers and commanders made the artist's reputation. His works fetched extraordinary prices and were avidly collected. His portrait of *Alexander as Zeus Keraunophoros* [the Thunder-Bearer] for the temple of Artemis at Ephesus fetched 20 talents; his *Aphrodite Anadyomene* [Rising from the Sea], intended for the temple of Asclepius at Cos, was eventually taken by the emperor Augustus in exchange for remission of a 100-talent debt.

Apelles' works included a variety of subjects: historical portraits of Philip, Alexander, Menander (satrap of Caria), and Antigonus Monophthalmus; such figures as philosophers, men of letters, actors, and priests; elaborate allegories; personifications; and naturalistic renditions of animals. He even painted a self-portrait, perhaps the first of antiquity. The most famous portraits were those of Alexander. Whereas it was Lysippus who appears to have been chiefly responsible for the development of a heroic image of Alexander, Apelles (and perhaps also Pyrgoteles) created a superhuman image and divine personality which were more suited to the needs of an Alexander who was the ruler of a great and unified empire. *Alexander as Zeus Keraunophoros* had obvious religious and political overtones for the

new empire. Some details of the painting are recorded (see below) though even the subject's basic pose is not described: perhaps Alexander was seated on a throne following Phidias' *Olympian Zeus*. The painting of Alexander in the house of the Vettii at Pompeii may reflect some of Apelles' influence.

Of Apelles' numerous portraits of Alexander, two others are notable for conveying the elevated status of the ruler: *Alexander in the company of Nike and the Dioscuri*, and *Alexander in a Triumphal Chariot* with the personification of War (Polemos) with bound hands. Such overt imagery was useful to later rulers, accounting for the prominent display of both paintings in the Forum of Augustus in Rome. Associations with that ruler were made even more directly when Claudius had Alexander's features replaced by those of Augustus. By creating such portraits of Alexander, Apelles breached the divide separating the human from the divine, making the deification of mortals much easier for later artists and rulers.

Of Apelles' allegorical paintings, his *Calumny*, created after he had been slandered and subsequently cleared at Ptolemy's court in Alexandria, is the most famous. Lucian (*Calumny*, 4) provides both the context and description for the work, which has been cited as the only known example of painted satire in antiquity. Several Renaissance artists (among them Dürer and Botticelli) attempted to capture the essence of the lost work using only Lucian's words.

The *Aphrodite Anadyomene*, Apelles' most famous painting, also inspired Renaissance artists. According to one tradition, Apelles had fallen in love with Alexander's mistress while painting her portrait. When he realized what had happened, the king gave her to Apelles, who then used her as the model for the *Anadyomene*. The story fits well with other information about his relationship with Alexander and with his reputation as a naturalistic painter of great talent. The painting was eventually displayed by Augustus in the temple of Julius Caesar, where it would remind viewers of Caesar's claim of descent from Venus-Aphrodite.

Some of Apelles' more elaborate concepts of abstract personifications included depictions of *Thunder* (*Bronte*), *Lightning* (*Astrape*), and the *Thunderbolt* (*Keraunobolia*). All probably were examples of his experimentation with lighting effects, which are recorded or surmised for other paintings. Lucian states that studied gradations in colours were used in the faces of the *Calumny* to distinguish its personifications, lighting technique may also account for the three-dimensional effect of the fingers holding the sparkling bolt of lightning in the *Keraunophoros*. The suggestion that Apelles increased the brightness of the bolt to make it stand forth by darkening the figure of Alexander provides a hint of what his

experimentation might have accomplished.

He is praised continually for the amazing realism of his works. His portraits were said to be so perfect that a physiognomist was able to determine the subject's age and how much longer he had to live. As with earlier painters, stories developed in which animals became judges of paintings, and were unable to distinguish between painted images and reality. When Apelles, entered in a contest to paint horses, realized that a conspiracy had already decided the outcome, he had real horses brought in to prove his skill by their neighing only at his work. As a general attribute of great artists, such comments about naturalistic renditions tell us little about the painters, but often allow other deductions.

The stories about Apelles seem to indicate that he concentrated on human and animal subjects rather than scenery and incidental detail. Nor does he seem to have been much concerned with elaborate perspective, although some of his works imply an interest in foreshortening. He painted an oblique portrait of Antigonus Monophthalmus, so that only his good eye would be visible, and a Heracles seen from behind.

Anecdotes about his friendly rivalry with Protogenes, another important painter, reveal some of Apelles' other techniques and interests. The two painters probably refined the skiagraphic technique (shadow painting), raising it to a new level. The contest in which they vied with one another in drawing a finer, steadier line reveals the importance of manual dexterity and control, which, in conjunction with the daily drawing practice of Apelles, serves to emphasize his probable belief that these skills were the foundations of his success. Naturalistic illusion through fineness of line seems to have been the key to Apelles' approach to painting.

His skill also was reflected by his use of only four colours. The technique had been in use for some time, but was probably brought to its acme by Apelles, whose fame inspired Renaissance artists to attempt to emulate his success with the restricted palette. The use of few colours and his eschewing of elaborate perspective and scenery made his simplicity of design, his beauty of line, and his charm of expression his chief merits.

In addition to his advances in artistic style and technique, Apelles also developed some sort of transparent varnish, a dark glaze (*atramentum*) that preserved the paintings and softened the colours, perhaps adding to the naturalism of the subject. Attempts to rediscover this substance have failed.

Unlike most other artists, Apelles was unusually receptive to criticism from all quarters, though he was also quick to counter undeserved criticism, whether from a ruler of Alexander's stature or a

common cobbler. The story of him hiding to hear criticisms of his works from people in the street, and then altering his paintings accordingly, fits well with his acknowledgements of other painters' abilities: Melanthius spaced his figures better, Asclepiodorus had better symmetry and proportions. Apelles believed himself the painter who excelled all in grace or charm (*charis*). His peers, his clients, and Roman emperors and nobles not only agreed, but regarded him as the best painter of antiquity. Scholars and artists since the Renaissance, intrigued by his reputation and descriptions of his paintings and techniques, have tried in vain to recover his genius.

Biography

Born c.370 BC in either Cos or Colophon, Apelles studied first at Ephesus under Ephorus and later at Sicyon under Pamphilus. He gained entry to the court of Philip II of Macedon. He alone was permitted to paint Alexander. He painted historical portraits, types, personifications, and animals. He achieved fame in his lifetime and became the most celebrated painter in antiquity, though none of his works now survives.

Aphrodisias

City in Asia Minor

Aphrodisias, an ancient city of Caria in Asia Minor (now Geyre in Turkey), is located about 240 km southeast of Izmir (formerly Smyrna) in a fertile plain with a good supply of spring water. The site was inhabited by the late Neolithic period; in the 4th millennium BC a prominent settlement was established and continued to exist there throughout the Bronze Age. Already in prehistoric times a fertility goddess was venerated at the site. As the fame of the local goddess, called Ninoe, gradually spread, a settlement with a sanctuary and a surrounding area under its protection was founded in the 1st millennium BC. Although a vigorous community developed during the Archaic period, one cannot speak of the existence of a city at this time.

Until the Hellenistic period Aphrodisias remained a sacred site with a sanctuary, associated, perhaps from the 3rd century BC, with the Greek goddess Aphrodite, after whom it was named, as indicated by coin inscriptions of the late 2nd and early 1st centuries BC. Its transformation into a city seems to be connected with the establishment of Roman power in western Asia. Although excavations on the site were undertaken at the beginning of the 20th century, it was not until 1961 that Aphrodisias began to be systematically excavated. The site is notable for its extensive and well-preserved monuments.

With the arrival of the Romans in Anatolia Aphrodisias flourished, largely because of its close relationship with Rome and especially with the family of Caesar. Thus Aphrodisias resisted Mithridates VI in 88 BC and the "Liberators" – Brutus and Cassius – after Caesar's death. In 40 BC Labienus, one of their supporters, attacked Aphrodisias and both the city and the sanctuary were plundered before Antony defeated him (39 BC). Thereafter Aphrodisias lay in Antony's sphere of influence. At this time the name of Aphrodisias appeared on coins together with that of the neighbouring city of Plarasa. In 39 and 35 BC Antony sent a senatorial decree to Aphrodisias, in which the Plarasians and Aphrodisians were addressed as citizens of the city, which presumably

resulted in the unification of the two cities. The decree guaranteed Aphrodisias its freedom as well as certain special privileges, such as a non-taxable status and asylum rights to the sanctuary of Aphrodite. During the Roman empire the population reached 50,000, and the city enjoyed a long period of prosperity and was transformed into an important cultural, religious, and artistic centre.

The city was laid out according to the Hippodamian town planning system and in the second half of the 3rd century AD a fortification wall, c.3.5 km long, was built around it against the threat of Gothic invasions. Elaborate buildings, such as the theatre, the tetrastoon, the agora, the baths of Hadrian, the Sebasteion, the odeum, the temple of Aphrodite, and the stadium (which could seat almost 30,000 spectators) were erected in Aphrodisias during Roman times. Traces of a gymnasium complex and a sculptor's workshop have also been recovered.

The theatre of Aphrodisias, one of the best preserved in Turkey, was built in the second half of the 1st century BC. It remained in use during the early Byzantine period and could hold around 8000 spectators. The wall of the north parodos was discovered to be lined with inscriptions and was thereafter referred to as the "archive wall". These documents – mostly letters – form a unique record for the history of Aphrodisias and of Roman Asia Minor.

To the southwest of the temple of Aphrodite stood a residential complex of the 3rd century AD. The building consisted of several rooms and halls and a peristyle court decorated with blue marble columns. Originally this may have been a private dwelling of a high Roman official, but in the Byzantine period it was the bishop's palace. A similar building, constructed in the 3rd century AD to the north of the temple of Aphrodite, is identified as a school of philosophy, which in the 6th century AD was used as a residence.

Aphrodisias became famous as a centre for medicine and philosophy. Xenocrates composed his medical treatises here, while the philosophers Alexander (one of the best commentators on Aristotle) and Adrastus originated from Aphrodisias. Statues, reliefs, and sarcophagi were produced in the sculpture workshops of Aphrodisias for local use and export. Local sculptors gained fame, and their signatures are found in many regions of the Mediterranean; their craftsmanship was appreciated even in Rome, and a school of sculpture was founded which lasted to the end of the 5th century AD. The sculptors managed to give new meanings to Classical models and did not limit themselves to mere reproduction of well-known works of Classical art. The marble quarries in the vicinity of Aphrodisias were a source of white and dark marbles. Sculpture competitions were also held in the city.

In the 3rd century AD changes in the administration of the Roman empire affected the privileged status of Aphrodisias, which was considered part of the province of Asia. After the formation of a new province of Caria and Phrygia in the 250s, Aphrodisias probably became its administrative centre. Under Diocletian (284 –305), it was the capital of the separate province of Caria.

Apollonius of Perge

Mathematician and astronomer of the 3rd century BC

The work of Apollonius of Perge, who was active in the late 3rd century BC, marks the end of the great creative period of Greek geometry. He was the author of a number of mathematical works, including *On the Cutting off of a Ratio* (which survives in an Arabic translation), and we are told by Ptolemy (who quotes one of his

theorems) that he did important work on the mathematics of astronomy. His status as one of the great mathematicians of antiquity, however, rests on his *Conica*, a treatise in eight books on the geometry of the ellipse, the parabola, and the hyperbola. The first four books, the only ones to survive in Greek, are described by Apollonius in his preface as an “elementary introduction”, and deal with the construction of the figures, their fundamental properties, and a series of theorems on a variety of mathematical relationships; they are modelled, both in their method of presentation and in their organization, on the *Elements* of Euclid. Of the remaining four books, three survive only in Arabic translation, and the fourth is completely lost. They deal with a number of separate additional problems, with little attempt to bring them together into a single system of argument; the quality of mathematical thought in these books (and especially book 5) is very high.

Apollonius himself makes little claim to originality, and it is certainly true that when he wrote his treatise Greek geometers had already been working on conic sections for some time. The first to do so was probably Menaechmus, in the 4th century BC, as part of his attempt at a solution to the problem of duplicating the cube. Later Euclid wrote a work on conics (now lost), and Archimedes also deals with them, particularly the parabola. Apollonius, however, in suggesting that he is simply compiling and systematizing the work of his predecessors, seriously under-states his achievement. Earlier Greek geometers had treated these curves as sections of different kinds of cone, cut by a line perpendicular to one of the sides of the cone. Cutting an acute-angled cone produces an ellipse, a right-angled cone a parabola, and an obtuse-angled cone a hyperbola. What Apollonius did was to show how all of these curves could be generated from sections of a single type of cone, the double oblique cone, thus achieving a much greater degree of generality. He deals with most of the features of cones familiar to modern mathematicians, and where he omits some (as, for example, the focus of the parabola) it is more likely that the reason is that he was trying to write an elementary treatise, rather than that he was unaware of them.

The *Conica* established itself as a sort of supplement to Euclid, and one of the basic texts of Greek mathematics, at a very early date. It was still being studied in the 4th and 5th centuries AD, when it was the subject of commentaries by, among others, Serenus, Hypatia, and Eutocius. The oldest surviving manuscripts date from the 9th century, a period when interest in mathematics was being revived in the Byzantine empire, which perhaps indicates that the *Conica* was still being regarded at that period as a fundamental text.

The 3rd-century AD mathematician Pappus gives brief descriptions of

five other works by Apollonius which are now completely lost: *On the Cutting off of an Area*, *On Determinate*

Sections, *On Tangencies*, *Plane Loci*, and *Vergings*. Pappus also preserves an extract of a description of a method of expressing and manipulating very large numbers, using 10,000 as base. Other works that are credited to Apollonius are a *Comparison of the Dodecahedron with the Eicosahedron*, a *General Treatise* (on the fundamental principles of geometry), *On the Cylindrical Helix*, a work on unordered irrationals, and the *Quick Delivery*, in which he calculated the value of π to a high degree of accuracy.

Biography

Active in the late 3rd century BC, Apollonius of Perge is best known for his work on *Conics* (of its eight books, four survive in Greek, three in Arabic, and one is lost). His only other surviving work is *On the Cutting off of a Ratio* which is preserved in an Arabic translation. Ptolemy says he also worked on the mathematics of astronomy.

Apollonius Rhodius c.295–215 BC

Epic poet and scholar

Apollonius was born at Alexandria (cf. Strabo, 14. 655) or, less probably, at Naucratis (Athenaeus, 7 p. 283; Aelian, *De Natura Animalium*, 15. 23). However, he is generally called the Rhodian on account of his retirement in Rhodes, where he is said to have revised his epic after its supposed initial failure to impress the Alexandrian audience, and, through his poem and his work as a rhetorician, to have won the recognition of the Rhodians and even the citizenship of Rhodes. There is probably an element of fiction in this account, which may have been suggested by the existence of some variants quoted in the scholia, which seem to point to an earlier text. According to his two anonymous biographies (contained in the Laurentian manuscript of the *Argonautica* and probably incorporating material derived from the late 1st century BC) and the *Suda*, he was a pupil of Callimachus,

with whom he is said to have quarrelled over the merits of long traditional epics over short and highly finished poems. The supposed existence of such an enmity – a supposition based on rather flimsy evidence – is, however, rendered improbable by the many striking parallels in the work of the two poets. According to Oxyrhynchus papyrus no. 1241 (late 2nd century AD), Apollonius followed Zenodotus as director of the library in Alexandria (270–247 BC) and was succeeded by Eratosthenes. The *Suda* puts him after Eratosthenes, no doubt due to a confusion with Apollonius the Eidograph, who is mentioned in the papyrus as the successor to Eratosthenes.

Apollonius' lost works include prose tracts on Hesiod (in which he apparently rejected the *Ornithomanteia* but accepted the *Shield of Heracles* as genuine), Archilochus, Antimachus, and a monograph on Homer entitled *Against Zenodotus* (cf. the Venetian scholia on Homer, *Iliad*, 13. 657), a choliambic poem on Egyptian legends entitled *Canobus*, and *ktiseis* or poems on the origin or foundation of cities (a genre fashionable at the time and reflecting Alexandrian enthusiasm for local history and cult) such as Alexandria, Naucratis, Caunus, Cnidus, Rhodes, and possibly Lesbos. The only surviving example of his epigrams (if the attribution is reliable) is an attack on Callimachus (*Anthologia Palatina*, 11. 275).

He was the first ancient writer to divide his own work into books, and in their number as well as in their length, the four books of his epic follow Aristotle's advice in the *Poetics* (chapter 23) that ideally an epic should be as long as the series of three tragedies and one satyr play presented by each poet at a dramatic competition. The *Argonautica* (which runs to 5,835 lines) narrates how Jason and his followers sailed to Colchis by the Propontis and Black Sea (books 1–2), how he won the Golden Fleece with Medea's help (book 3), and how the ship returned home (book 4).

Among the poet's major literary antecedents may be mentioned the fourth Pythian Ode of Pindar, with its account of the Argonautic expedition, and the *Medea* of Euripides. However, Apollonius' main inspiration is Homer, and this influence permeates almost every aspect of his creation, and is most evident in set scenes. Thus the catalogue of the Argonauts (1. 23–233) corresponds to Homer's catalogue of ships in *Iliad* 2, while the description of Jason's cloak (1. 721–67) has been suggested by the shield of Achilles in *Iliad* 18. These scenes serve to bring out by contrast the significant differences in Apollonius' poem. The same is also true of individual characters in relation to their Homeric prototypes: compare Jason with Odysseus or Medea with Nausicaa and Circe.

The Hellenistic period was an age of scientific and scholarly achievement, and the Hellenistic poets considered this knowledge as

part of their artistic material. In keeping with contemporary trends, therefore, Apollonius brings his scholarship to bear on his composition by explaining the causes (*aitia*) of names, cults, relics, customs, and natural phenomena. The scholia record many of the sources that he so diligently consulted. His learning stresses the significance of the Argonautic expedition as a voyage of acculturation, establishing Greek tradition. It has been suggested that the repeatedly positive evaluation of Greek culture (including cult and mythology) should be connected with the Ptolemaic context of the work, since the Ptolemies promoted themselves as the true heirs and champions of Classical Greek culture (Hunter, 1993, chapter 6).

Apollonius was also the first Greek poet to place love in the foreground of the action in an epic and to study its psychology, thereby creating a new trend in western literature. Although he is dealing with a heroic legend, its central theme is not war but love. The capacity he shows for sympathetic analysis in his account of Medea's love for Jason is something not found in earlier Greek literature, with the possible exception of Sappho, whose work, however, has survived only in fragments. His descriptive power is revealed in the many charming *ekphraseis* (descriptions) with which he adorns his poem, once more in keeping with Hellenistic tradition. He also introduces a number of striking and suggestive similes. These descriptions and similes, as well as his fresh treatment of old episodes, serve to attract the reader.

The principal defect of the poem, according to some modern critics, is its lack of structural unity. In their view, Apollonius fails to organize into a whole his abundant array of erudite material, and too often the narrative breaks into long, disjointed passages. It has been pointed out, however, that discontinuity is Apollonius' principle of composition, and that this principle operates in the organization of the narrative both within the book and between books. Although constructed with great care, especially in its versification, its uniform mediocrity often makes the poem positively tedious. He has also been criticized for weak characterization. His Jason lacks the energy expected of a heroic leader, and lacks sufficient development to attract the reader's interest. In each of the two last books where she appears, Medea, as impressionable virgin and dangerous sorceress respectively, is inconsistent (when seen against Aristotle's requirement of consistency for the dramatic character), though she is beautifully drawn and the gradual growth of her love for Jason is described with a truly artistic moderation.

His hexameters generally follow the Homeric pattern, and so does his vocabulary. However, in keeping with the usage of Alexandrian authors, he continually varies and "interprets" the Homeric words and

phrases. His greatest stylistic achievement is in fact the subtle adaptation of the Homeric language to express the romantic sentiments of his own age, but its brevity and conciseness are in marked contrast to the natural and easy flow of the Homeric poems.

The *Argonautica* appears to have enjoyed considerable popularity even during Apollonius' own lifetime, for we hear that contemporaries, such as Charon, wrote commentaries on it. Our present scholia are abridged from the commentaries of Lucillus of Tarrha, Sophocles, and Theon, all of whom apparently belong to the pre-Christian era. There are 52 known manuscripts, and numerous papyri testify to the poem's popularity in later antiquity. There are two sets of scholia: the Florentine and the Parisian. The former were published in the edition by J. Lascaris (Florence, 1496), and the latter were first published in Schaefer's edition (2 volumes, Leipzig, 1810–13) and consist mainly of verbal explanations and criticisms. The scholia also speak of one Eirenaius as the author of a critical and exegetical commentary. During the reign of the Byzantine emperor Anastasius I (AD 491–518), one Marianus paraphrased the *Argonautica* in 5608 iambics. In recent times the *Argonautica* has attracted the serious attention of scholars. Surprisingly, there were no English translations of the *Argonautica* until those of K.P. Coleridge (1889), R.C. Seaton (1912.), and E.V. Rieu (1959). However, Between 1990 and 1997, three new translations appeared, by Barbara Hughes Fowler (1990), Richard L. Hunter (1993), and Peter Green (1997).

Biography

Born c.295 BC probably in Alexandria, Apollonius is called the Rhodian because he retired to Rhodes, apparently to revise his epic poem, the *Argonautica*, after its poor reception in Alexandria. A pupil of Callimachus, he was director of the Alexandria library after Zenodotus and before Eratosthenes. Lost works include prose tracts on other poets and poems on the foundation of cities. He died in 215 BC.

Appian c.^{AD} 95–160s

Historian

Appian was a Romanized Greek, who was born in the dynamic but turbulent city of Alexandria in Egypt. Josephus refers to the “constant strife between the natives and the Jewish colony” (*Jewish War*, 2. 487) that had existed ever since Alexander the Great had given the Jews permission to reside in the city with the same rights as the Greeks. One dramatic fragment of Appian’s lost autobiography relates his narrow escape from an angry group of Jews during the Jewish revolt (AD 115–17). This personal experience of civil unrest may help to explain why Appian devotes such a large proportion of his historical narrative to the Roman civil wars of the 1st century BC. Subsequently, he left Alexandria and moved to the more secure environment of Rome, where he became an advocate and was eventually awarded a procuratorship. We have a letter from Fronto to Antoninus Pius (emperor AD 138–61) requesting this position for his friend.

Appian’s most important achievement is his historical work, the *Romaica* (written between c.^{AD} 148 and 161), which narrates the rise of Rome and its progressive conquests of different nations “in order to understand the weaknesses or endurance of peoples, as well as the virtues or good fortune of their conquerors, or any other factor which contributed to the result” (preface, 12). This focus recalls the pragmatic historiography of Polybius (c.200–c.118 BC), who in the *Histories* likewise seeks to explain the growth of Roman power. Yet where Polybius analyses a 53-year period in 40 books, Appian’s chronological scope is broader, moving from the kings of Rome to Trajan’s war in Arabia in 24 books. The *Romaica* are structured along geographical and ethnic lines, with each book usually devoted to a particular people, although book 8 (Hannibal) and book 12 (Mithridates VI) break the pattern by focusing on individual enemies

of Rome.

We do not have Appian's whole work, but what survives is impressive and revealing. Appian was writing for a cultured Greek-speaking readership, who wanted to understand more about Roman history and institutions. Consequently, the narrative is punctuated with practical explanations, which frequently remind us that Appian is looking at Rome from the viewpoint of the provincial outsider. So, the military eagle is described as "the symbol held in the highest regard by the Romans" (*Civil War*, 2. 61. 256). Not only does Appian offer explanations of potentially unfamiliar terms, but his Greek prose is accessible and sometimes even includes transliterated Latin words. The 9th-century Byzantine scholar Photios approvingly characterized Appian's Greek as "plain and unadorned". The discovery of a papyrus at Dura Europos containing fragments from Appian and Herodotus suggests that the Alexandrian historian was indeed popular. Some modern critics suggest that Appian's main significance lies in his preservation of crucial material from lost historians such as Asinius Pollio, but this is to under-value the *Romaica*. Appian in his own right made Roman history accessible to an inquisitive Greek-speaking audience, who were themselves increasingly involved in government and administration within the empire. That there was an appetite for historical texts about Rome among this mobile, Greek-speaking elite is suggested by Zenobius' translation of Sallust's works into Greek under Hadrian. Of course, Greek speakers could always turn to the universal histories of Nicolaus of Damascus or Diodorus Siculus, but these were almost too comprehensive (144 and 40 books respectively), and both narratives stopped in the 1st century BC. The expansion of the Roman empire between the reigns of Augustus and Trajan called for an updated history, which Appian provided.

Although the *Romaica* helped to orientate Greek-speaking readers in the Roman world, Appian could still criticize Roman methods and shortcomings. So Appian narrates the proscriptions with particular disgust (*Civil War*, 4. 16), and outlines the sufferings of the people of Gomphi, including one incident where 20 distinguished elders, who had poisoned themselves, were discovered lying on the floor "as if they had succumbed to drunkenness" (*Civil War*, 2. 64. 268). Poignantly, Appian juxtaposes the genuine inebriation of Caesar's callous soldiers with the apparent drunkenness of these desperate citizens. It is at such moments that Appian's background as a provincial offers us some uncompromising perspectives of Rome.

Appian's *Romaica* survived, albeit in a fragmented state, largely thanks to the efforts of the excerptors who worked for the emperor Constantine VII Porphyrogenetos (913–59). The first printed edition (Venice, 1477) was a Latin translation by Pier Candido which had

been commissioned by Pope Nicholas V. The popularity of this edition prompted first an Italian translation (Rome, 1502) by Alessandro Braccio on the foreign wars, and a French translation (Lyons, 1544) by Claude de Seyssel dedicated to King Louis XII of France. Seyssel's translation inspired several baroque dramatists, including Pierre Corneille, who took material from Appian for his tragedy *Rodogune* (Paris, 1647). Yet no printed text of Appian in Greek appeared until Carolus Stephanus' edition (Paris, 1551). The first English translation (London, 1578), by William Barker, was grandly entitled *An Auncient Historic and Exquisite Chronicle of the Roman Wanes, with a Continuation from the Death of Sextus Pompeius till the Overthrow of Antonie and Cleopatra* and praised Appian as a "noble orator and historiographer". Since Appian's narrative of the civil wars ends with the death of Sextus Pompey, Barker decided to supplement the account with material from Plutarch. Subsequently, William Shakespeare used Barker's Appian when writing *Antony and Cleopatra* and especially *Julius Caesar*. Appian's work remained popular, although not everybody had to rely on translations. In a letter to Engels, Karl Marx wrote: "As a relaxation in the evenings I have been reading Appian on the Roman civil wars in the original Greek. A very valuable book. The chap is an Egyptian by birth. Schlosser says that he has 'no soul', probably because he goes to the roots of the material basis for these civil wars." So, from the late 15th century onwards, Appian has continued to appeal to notable dramatists and intellectuals seeking to gain access to the Roman world through a lucid and accessible historian, who originally wrote to inform a predominantly non-Roman audience.

RHIANNON ASH

Biography

Born in Alexandria c.AD 95, Appian experienced the Jewish revolt of 115–17 before moving to Rome where he became an advocate and later a procurator. He died in the 160s. He wrote a history of Rome in 24 books for a Greek-speaking readership. Beginning with the kings of Rome, it is organized on geographical and ethnic principles, and ends with Trajan's war in Arabia. Not all of it survives.

Apulia

Region of southeast Italy

Apulia (modern Puglia) has been associated with Greek culture since antiquity. The region has Messapian or Greek foundation legends, mentioned already in the writings of Herodotus (7. 170). The name Iapygia is used by Greek writers to denote the same region, although it also refers to the region of Calabria. Many places in Apulia were colonized by Greek cities by the end of the 8th century BC, but that was just the climax of a long history of contacts between the Greeks and the autochthonous population of Italy. One of the most important cities of the area, Tarentum (ancient Greek Taras, modern Taranto), was supposed to have been founded around 706 BC by Spartans as their only colony. The gulf of Taranto had already been colonized by Achaeans from the Peloponnese, who first established Sybaris in 721 BC and then Croton and Metapontium. Taras, the only Dorian colony, was founded after the first Messenian War (traditionally in 706 BC), an example of the tensions in Greece that led to colonization. The founders came from Amyclae, an ancient sacred town of the Spartan state, and according to Strabo (6. 3. 2f.) were linked to Spartans by the maternal side only; they were thought to be illegitimate children of unmarried women, thus they had the name *partheniai* (“sons of concubines”). It is possible that they were of pre-Dorian origin. They were guided by an oracle to establish a colony in the west, and this is typical of the role of religion, and oracles in particular, in sanctioning new settlements. One of the first things that the colonists would do was to establish their religion.

The Greek colonies in Apulia flourished thanks to the craftsmanship and trade that soon developed. Taras, in particular, owed its prosperity to the textile and pottery industries that were soon supplying the rest of Italy. Taras was also famous for its jewellery, as the exquisite collection of the modern archaeo-logical museum bears witness today. Many of the most important archaeological finds were made only as a result of bombings in World War II. Sybaris was

proverbial for its wealth and luxury (Herodotus, 6. 126) and had developed commercial relations with Miletus in Asia Minor. After the initial colonization, many of the cities were able to found further colonies; thus Sybaris founded Poseidonia (the Latin Paestum) on the west coast of Italy. Metapontium, Sybaris, Croton, Siris, and Paestum are known as the “Achaean” area, a term that refers not only to the origin of many of the colonists but also to the artistic styles that were developed there. The artistic currents of Magna Graecia combine many elements.

Sybaris was destroyed by Croton in 510 BC, and the city of Thurii was founded on its site, at the initiative of Pericles, in 444 BC. The famous city planner Hippodamus of Miletus designed the city and was himself one of the leading colonists. This was a part of the ambitious strategy of Pericles to make Athens the centre of a greater Greece. The geographical situation that gave all these cities immediate access to the sea and a fertile hinter-land was a significant factor for their later development. This economic growth was soon to be followed by cultural development. Apulia, together with Calabria and Sicily, constituted the region of Magna Graecia. The region of Apulia drew the attention of Rome at the end of the 4th century BC and the Tarentines invited king Pyrrhus of Epirus to assist them in 280 BC. During the Hannibalic and Social Wars there were serious revolts against Rome, which were followed by the destruction of many Apulian cities. After it was annexed to the Roman empire, the region experienced troubled times. Under Diocletian Apulia and Calabria formed a single province. Christianity reshaped the cultural history of the region.

Arabs

Herodotus was familiar with the Arabs of southern Palestine and the Sinai as well as those of the frankincense-producing region. According to him the Arabs were among the nations that paid tribute to Darius I of Persia (Herodotus, 7. 69, 3. 97). But it was the expeditions of Alexander the Great in the region of the Red Sea that brought greater knowledge of the Arabs to the Greeks, as reflected, for example, in the partially preserved work of Agatharchides, the source of Diodorus Siculus' description. According to Arrian (*Anabasis*, 7. 19. 5), Alexander's last plans included the conquest of the eastern Arabian coast, and in preparation for this he dispatched naval expeditions to both the Persian Gulf and the Red Sea. The presence of Hellenistic Greeks in Bahrain and especially in Failaka, and Antiochus III's expedition to Gerrha in the Saudi interior, reflect early interest in Arabian and Indian trade on the part of the Seleucids. Ariston explored southwards as far as Babel-Mandeb for Ptolemy, who punished the hostile Nabataeans of Petra by tapping the incense route to the south of the city through a trade arrangement with the Lihyanites of Dedan. During Hellenistic times the northern territories as far as the Negev and Transjordan were inhabited by the Nabataean Arabs, who developed their land through skilful water conservation. The southern kingdoms were Minaea on the Red Sea, Katabania at the straits of Hormuz, and Sabaea, the Hadramaut, and Mhra along the south coast. Minaea had ceased to exist by the 2nd century BC and Yemen was dominated by a confederacy of Sabaeans and Homerites. Apart from these petty kingdoms of the south and the north, and to a large extent within them, the political organization of pre-Islamic Arabia was a primitive kinship structure united in clans and tribes which were named after a supposed common ancestor. As a political unit, pre-Islamic Arabia existed only in the careless nomenclature of the Greeks, who used the name Sarakenoi (apparently from the Arabic *Sharqinun*, "easterners") to denote all the population of the peninsula.

For his accounts of the Arabs of Mesopotamia (along the Euphrates), Egypt (Sinai and the Red Sea), southern Jordan (the Nabataeans), the steppe, and eastern Arabia (Gerrha), Strabo depended on Hellenistic sources as well as the Arabian campaign of Aelius Gallus under Augustus. Although this expedition ended in failure, Roman naval predominance in the Red Sea was secured, and the movement of Roman merchantmen between Egypt and India was facilitated by the reduction of Aden, whoever may have been responsible for it (*Periplus* M.E. 26).

For the Greeks and the Macedonians, Arabia was important chiefly for its incense and spices as well as for gold and gems. They also depended on the Arabs as middlemen for their Indian trade. However,

the importance of this role diminished after Hippalus discovered the use of the monsoons for annual direct voyages to India. It is sometimes claimed that this practice was already known to the Arabs for centuries and that the Greeks merely learned from them; but one has to question whether Arab ships of the time were capable of such voyages even if the Arabs knew the “secret” of the monsoons. For both Classical and biblical authors, the defining characteristics of the Arabs were nomadism, pastoralism, and the camel-based caravan trade. However, their military strength is already mentioned in early (Assyrian) sources, and becomes prominent in Roman times. The organization of the southern sector of the *limes* shows that the Romans of the empire took account of their historical role, their steady pressure on the settled lands of the north, and their infiltration into the Syrian end of the Arabian peninsula. The evolution of this military frontier-in-depth from the Euphrates to the Red Sea involved absorption of the client Nabataeans into the Roman provincial system. This was achieved by Trajan in AD 106 through the expedition of Cornelius Palma. The resulting province of Arabia expanded slightly to the north under Septimius, and was divided by Diocletian into Arabia and Palaestina Salutaris, the latter subsequently incorporated into Palestine around AD 358. During the 4th and 5th centuries the *limes* was strengthened in response to the Saracen threat; but by the 6th century it had fallen into decay, so that the Muslim Arab invasions of the early 7th century found it no obstacle. The Arab *foederati* who (with the Phylarch as their chief) shared with the *limes* the defence of the Roman east, included the Tanukhids of the 4th century, the Salihids of the 5th, and the Ghassanids of the 6th.

Aratus

Author of astronomical poetry of the 3rd century BC

Aratus, the author of *Phaenomena*, the most influential poem in ancient Greek after the Homeric epics, flourished in the first half of the 3rd century BC. Four ancient *Lives* and the entry in the *Suda* combined show that he was born in Soli in Cilicia, that he studied in Athens, where he associated with Callimachus and the philosophers Timon of Phlius and Menedemus of Eretria, and that he was taught Stoicism by Zeno. The only sure date in his biography is 277/76 BC, when king Antigonos Gonatas brought him into the royal Macedonian court at Pella. After a time in residence at the court of the Syrian king Antiochus, Aratus returned to Pella, where he predeceased Antigonos (d. 240 BC).

Aratus composed many works, including a scholarly commentary on Homer's *Odyssey*, a hymn to Pan that celebrated Antigonos' defeat of the Celts in 277 BC, epigrams (two survive), other elegiac poems, funeral dirges, a hexameter poem called *Iatrica* ("Medical Healing"), a poem about the harmony of the spheres called the *Canon* ("Table"), and *Astrica* ("On Stars") in at least five books. This list may include a collection called *To Kata Lepton* ("Works Slenderly Composed", from which the collection in the *Appendix Vergiliana* derived its title), or that descriptive may apply to Aratus' poetic style generally. His only surviving work is the *Phaenomena*, a didactic epic poem in the style of Hesiod that deals with the astronomical constellations and with weather prognostication. The poem consists of 1154 hexameters: a Stoic proem to Zeus, whose influence pervades the poem (1–18); the constitution of individual constellations in the northern and southern skies (19–453); the planets (454–63); the measurement of time and how to mark nocturnal time by simultaneous risings and settings (462–757); weather signs (758–1141); and a conclusion (1142–54).

The first *Life* explains that Antigonos commissioned the *Phaenomena* by asking Aratus to versify the prose treatise on astronomy by Eudoxus of Cnidus (fl. 340 BC). The extant commentary by Hipparchus details the relationship between Aratus' poem and Eudoxus' source material. Although Aratus' astronomical inaccuracies disturbed Hipparchus, the poem enjoyed immediate recognition and lasting success among readers who were taken by its poetic achievement. The *Phaenomena* masterfully proceeds in an epic style calculated to emulate Hesiod, whose reputation flourished in the early 3rd century BC, the golden age of Hellenistic poetry. Aratus' literary accomplishment was not lost on contemporaries. The great Hellenistic poets Callimachus (*Epigrammata*, 27) and Leonidas of Tarentum (*Anthologia Palatina*, 9. 25) praised Aratus' refinement – each using the adjective *leptos* (subtle) particularly – and Ptolemy Philadelphus stated in an epigram (*Supplementum Hellenisticum*, 712) that the *leptologos*

(subtle-tongued) Aratus deserved to wield the sceptre among poets on astronomical topics. This terminology suggests that the poet's intended audience was an elite readership with interests in literary esoterica.

That some 20 subsequent authors wrote commentaries on Aratus or composed *Aratea* demonstrates the breadth of the poem's influence. It is among a handful of Greek poems to have been translated anciently into Arabic. And its influence on Roman poetry is of tremendous importance. The influence is manifest in the great didactic hexameter poems written by Lucretius and Virgil (*Georgics*) in the 1st century BC, both clearly having been influenced by Aratus' style. Latin poets exhibited a "strong urge to win Aratus for Latin" as part of a patriotic move to "absorb the three great poets [i.e. Callimachus, Theocritus, and Aratus] of the classic Hellenistic generation" (Courtney, 1993). This urge was made manifest among the new poets by China, who brought a copy of Aratus back from Bithynia; by Varro of Atax, whose *Ephemeris* closely recalls Aratus in its extant fragments; and by a youthful Cicero himself, whose *Aratea* consists of 480 continuous lines and some 70 additional lines called the *Prognostica*. Virgil mines Aratus for material in a remarkable passage of the *Georgics* (1. 351–460). Although Ovid's *Phaenomena* survives in only two fragments, both bear strong resemblance to Aratus. Germanicus modernized Aratus, fitting the whole into 725 lines, of which 200 are not based on Aratus, and correcting some errors. Avienus (fl. mid-4th century AD) composed a version expanded by more than 700 lines over what Aratus himself had written: *Aratea Phaenomena* (1325 hexameters) and *Aratea Prognostica* (552 hexameters). This interest propelled Aratus into western literature with immense influence (Böker), which is still working today.

ROGER T. MACFARLANE

Biography

Born in the late 4th century BC in Soli in Cilicia, Aratus studied in Athens where he was taught Stoicism by Zeno and associated with Callimachus, Timon of Phlius, and Menedemus of Eretria. In 277/76 BC he was introduced to the Macedonian royal court at Pella by Antigonos Gonatas. He composed much poetry but only the *Phaenomena* survives, a didactic poem on astronomy. He died before 240 BC.

Arcadia

Region of the central Peloponnese

Arcadia is a mountainous region in the centre of the Peloponnese rising to heights of more than 2000 m. It did not gain political independence until late in the Classical period when in 366 ^{BC} Megalopolis, the "great city", was founded. But in 234 the poleis of Arcadia joined the Achaean League which became subject to the Romans. After the defeat of the Macedonians at the Rattle of Pydna in 168 ^{BC}, the Romans took 10,000 Arcadian nobles as hostages to Italy; among them was Polybius, who was later to become an admirer of Roman imperialism. The destruction of Corinth in 146 ^{BC} also resulted in the end of Arcadian liberty.

Arcadia was not only a physical landscape; it became also a mental landscape ("geistige Landschaft"; as described by Bruno Snell in *Die Entdeckung des Geistes*), representing a cultural idea on which certain ideals were based. Poets of the Hellenistic period made Arcadia the scene of a charming but unrealistic poetry of shepherds and other herdsmen, chief among whom was Pan, the lewd god of the herdsmen with the legs of a billygoat who was always playing the panpipes. The bucolic genre, however, did not arise in Arcadia, but in Sicily (Theocritus, the Greek representative of bucolic poetry, was born in Syracuse).

It was the Roman Virgil (70–19 ^{BC}) who combined Arcadia and bucolic poetry. He knew the historical work of Polybius with its warm description of the inhabitants of old Arcadia, and he wrote the *Bucolica*. Thus Virgil founded a special genre for all European literatures.

Archaeology

Our knowledge of Greek culture was originally derived from written documents, historical texts, and other literature, transmitted through the Middle Ages and the schools of Constantinople. It was largely the dispersal of Byzantine manuscripts to the west that led to the revival of interest in ancient Greece and its achievements, and the development of Classical Greek studies as a fundamental part of western education. At the same time, the conquest of Greece by the Ottoman Turks made Greece difficult of access, and Greek remained essentially a matter of book learning. Travellers such as Cyriac of Ancona, who visited and recorded surviving monuments in the mid-15th century, were most exceptional.

During the 18th century there was a considerable development of interest in the physical remains of antiquity, particularly in Italy. Antiquities were collected by wealthy aristocrats making the Grand Tour, and excavation was carried out at ancient sites, above all Pompeii. The Greek remains in southern Italy, especially the temples at Paestum, came to be known, appreciated, and even copied (e.g. the columns in Joseph Bonomi's church of St James at Great Packington in Warwickshire, of 1789–90). More crucially, in 1751 the aristocratic Society of Dilettanti sent James Stuart and Nicholas Revett to Greece itself, to produce accurate measured drawings of the ancient Greek buildings in Athens and elsewhere, as exemplars for Greek Revival architecture. This was a real stimulus to antiquarian interest in the material remains of ancient Greece, even if there was in all this much of the approach that can be summarized as "Fair Greece, sad relic". From this time there was a steady stream of artists and architects visiting Greece to record the monuments.

All this was transformed, if slowly, by the War of Independence and the freeing of at least part of Greece. The recovery of the material evidence for ancient Greek culture now became a fundamental aspect of the national heritage, and even as Karl Friedrich Schinkel was producing plans for his "dream palace" to house the Bavarian king Otho on the Acropolis of Athens, Kyriakos Pittakis (the brother-in-law of Theresa Makri, Byron's Maid of Athens) was struggling to recover and preserve the fallen and scattered fragments of Classical buildings and sculpture as the Turkish structures there were demolished. The

new Greek state passed its law of 10/21 May 1834 that concerned the uncovering and conservation of antiquities. Already, in 1829, Kapodistria had established the Archaeological Service, and in 1833 Adolf Weissenberg had been put in charge of “the conservation, discovery and collection of the archaeological treasures of the Kingdom”, with Pittakis responsible for northern Greece, J. Kokkonis for the islands of the Aegean, and Ludwig Ross for the Peloponnese. In 1837 came the foundation of the Archaeological Society of Athens.

Their work was undoubtedly hampered by the poverty of the newly independent state. At first there were very few purpose-built museums (that on Aegina was one of them). At Athens antiquities were stored in the Theseum (temple of Hephaestus), in the Propylaea, in a Turkish cistern in front of the west end of the Parthenon, and in a Turkish house behind the Erechtheum. Conservation work was often crude; although the temple of Nike was resurrected from the Turkish gun bastion into which it had been incorporated, the patching of the Erechtheum was elementary, while the north wall of the Parthenon was supported by a rough and intrusive structure of brickwork.

Into this context came the foundation of the foreign schools, beginning with the French in 1847, which brought much greater resources to the development of Greek archaeology, whether state-supported or funded by wealthy individuals. There was increasingly a new approach, the transformation from collection and antiquarianism to scientific archaeology. Already in the 1850s Charles Newton was emphasizing, in his proposals to excavate the Mausoleum at Halicarnassus, the need for a proper archaeological approach (which he achieved with the recording of his work, including the use of photography), even though, by digging in what was still the Ottoman empire rather than Greece, his main purpose was to acquire material for the collections at the British Museum. At the same time, significantly, he was stressing the need for archaeology to be recognized as an essential element in the study of Greek civilization.

From this time, archaeology has transformed our knowledge of Greek culture. In many ways, the most significant single development has been the discovery and ongoing interpretation of Greek prehistory. Excavations at the major prehistoric sites, on the mainland at Mycenae, Tiryns, Pylos, and a whole host of other places, together with those on the island of Crete, have revealed a complete new world of Greece before the Classical Greeks. The discovery at Knossos, Pylos, and elsewhere (most recently, under the streets of modern Thebes) of the Linear B tablets, and their brilliant decipherment in the 1950s by Michael Ventris, has brought us knowledge of the Greek language at a stage more than 500 years earlier than Homer, and with this an understanding of Greek society in a different form, centuries before

the evolution of the Classical city states. It has shown us, too, the pre-Greek world of Crete, on top of which the prehistoric Greeks developed, and has enabled us to trace its formative elements from Egypt, the Near East, and Asia Minor. None of this was known before the excavations of Heinrich Schliemann, Arthur Evans, Carl Blegen, and many others.

Turning to the Classical period, archaeology has broadened immensely our knowledge of the Greek world at that time. In Athens we can now see the Agora, not just read about its involvement in the affairs of the city. We no longer have to rely on Thucydides' assurances to understand the physical contrast between the cities of Athens and Sparta. Even things of little significance in themselves make our understanding of the Classical world more real and vivid: we can now actually see the gash made in the forehead of Philip of Macedon by the arrow that removed the sight of one of his eyes at his siege of Methone; but more significantly, in the material that was buried with him in his vaulted tomb at Aegae/Vergina we can see something of the luxurious wealth that characterized his royal existence in the palace at Pella (whose plan itself has been revealed in recent excavations). Beyond the Classical period, archaeology traces (more clearly than the broken written record) the essential continuity of the Greek world; more attention than previously is paid to post-Classical remains, for example, in the excavations at Corinth.

The contribution of archaeology to our understanding of Greek culture can be divided into two broad categories: first, the recovery of actual material from the earth, and secondly its interpretation. Recovery is not confined to excavation. Surveys of extended areas, the study of the distribution of artefacts over the ground, give information about settlement patterns outside the obvious city sites, and their variation at different periods of Greek history, down to the present day. The study of surface evidence, as well as that from excavation, has given us the street plans of innumerable Greek cities. We can now see not only the great temples of the major religious sanctuaries, but also places of lesser, or even completely minor cults, and thereby understand more of the place that these cults had in the lives of the ancient Greeks. It is possible to see more of the workings of the cults, the objects deposited as offerings, the buildings associated with religious practice, often specialized such as those provided – for a select minority – for the ritual feasting that was an essential element of Greek religion. Archaeology has extended our documentary evidence for Greek civilization, above all the discovery and recording, already started by Cyriac of Ancona in the 15th century, of inscriptions. The range of these is immense: they include major historical events, such as the evacuation of Athens at the onset of

Xerxes' invasion (though this inscription is later than the event, and raises problems of interpretation). From inscriptions we have the oath sworn by the founders of Thera's colony at Cyrene, records for building the temples at Athens, and of the development of the sanctuary of Asclepius (and thus the Asclepius cult) at Epidaurus. We can assess the tribute paid by the dependent states of Athens' empire, and read the lists of property confiscated from those who mutilated the hermae on the departure of Athens' doomed expedition to Syracuse. Excavation in Egypt, whether organized or, to use a euphemism, commercial, has produced the texts of literary works that did not survive the rigorous exclusions of Byzantine copying, but also more personal documents, bills, receipts, even the private letters of the Greeks in Hellenistic and Roman Egypt. The list is never-ending.

In short, archaeology has shown the complete context in which Greek civilization developed and flourished, as well as its periods of decline. It has given us a first-hand knowledge, not easily recoverable from other sources of information, of Greek art and architecture (which is Classical archaeology in its original meaning). Though much has been lost, discoveries are still accumulating. Without archaeology we would have no visual knowledge of the sculptures that decorated the temple of Zeus at Olympia, or of the marble masterpieces dedicated on the Acropolis of Athens in the 6th century BC and buried after their desecration at the hands of Xerxes' soldiers in 480 BC. Even if chance finds have given us the powerful bronze god (surely Zeus) fished up off Cape Artemisium, or the Riace warriors, plausibly if not with certainty attributed to Phidias himself, it is the techniques developed for the conservation of antiquities that have restored and stabilized them. The literary sources – such as Pausanias – tell us of important paintings, and tantalize us with their descriptions of lost masterpieces; archaeology has restored to us at least the masterpieces painted on the walls of the royal tombs at Vergina, revealed in the late 1970s by Manolis Andronikos, their colours as fresh as the day they were painted, their style compared by their discoverer with that of the old masters. These same graves, and others elsewhere, both in and beyond the Greek world, have produced for us splendid examples of Greek metalworking, in gold and silver as well as bronze, of which there are otherwise only the dimmest echoes in the ancient written sources.

Archaeology has also recovered much of the everyday aspects of Greek civilization. We now have examples of the houses in which the Greeks lived, generally reduced to foundations and footings, but with some better preserved, and certainly with more evidence to show what they were like when they were intact, ranging in date from the prehistoric to the present day, and from all levels of society.

Archaeology has uncovered much of the paraphernalia of everyday life, or at least that which was not made of perishable materials (in rare circumstances, even this has survived). The painted vases, too, illustrate not only legends and mythology, but also scenes from everyday life – in the house, at school, at the workplace, at the bottom of the mines, in the exercise grounds of the gymnasia. They show us the drinking parties, as well as the fun and games that went on there. But they also help to fill out our knowledge of contemporary houses, for they illustrate the furniture – couches, chairs, chests – and the way that objects were hung on the walls of the feasting rooms.

More specialized aspects of archaeology give us further information. Underwater research has been particularly rewarding, starting with the finds dredged up, like the Artemisium Zeus, by fishing nets, but more recently developing, thanks to advances in diving technology, into a branch of scientific research that not only locates wrecks but investigates and records them in every detail. The identification of such wrecks, and their cargoes, of all periods, has produced much information on patterns of trade in Greek waters, and wider afield in the Mediterranean. It has even led to the recovery of the remains of ancient ships, particularly the 4th-century BC Kyrenia wreck, which has given us information about the relative longevity of ordinary small trading vessels, and, most invaluable, about the technique of ship construction.

With archaeology go the scientific techniques developed to assist in interpretation. Analysis of pollen, seeds and other vegetable remains in soils and in rubbish pits tells us about crops and diet. Analysis of pottery fabrics tells us where they were made, including the plain wares that were, with their contents, an important part of the export trade of Greece. If our understanding of the Greek world, from the beginning to the present day, is so much wider now than it was a century ago, or compared with the time when the texts were our only source of information, it is archaeology that has made the difference.

Archaic Period c.700–479_{BC}

The Archaic period of Greece, which follows the Geometric and precedes the Classical period, is traditionally dated c.700–479_{BC}, for the Geometric style of pottery decoration ends and Orientalizing styles appear around 700_{BC}, while the end of the Persian Wars in 479_{BC} marks a significant turning point in Greek history. Some, however, especially archaeologists, like to distinguish the first 100 years of this span (c.700–600_{BC}) as the Orientalizing period, and others prefer to start the Archaic as early as c.750_{BC} so that its beginning coincides with the Greek renaissance. Some recent scholars would also like to end the Archaic period c.500_{BC}, somewhat earlier than the traditional date of 479.

The Archaic period is marked by some of the greatest achievements of the Greeks, visible in such diverse areas as pottery and sculpture, the architecture of the great temples and sanctuaries, lyric poetry, philosophical speculation, and the shift to new forms of political organization. In most respects these achievements were the direct result of developments begun at the time of the Greek renaissance from c.750_{BC} on. The great colonization movement that had begun then continued during this period. Most of the Greek colonies had been established in the west by 650_{BC} and in southern Italy and Sicily later became known as Magna Graecia because of the large number of newly established Greek settlements there. The Greeks, however, also went further afield, into France and Spain, North Africa and the Near East, and, in fact, the colonization movement did not end until about the middle of the 6th century_{BC}.

This was an era of great thinkers and writers. In Ionia Greek philosophy was born. Thales, Anaximander, and Anaximenes, all from Miletus, sought answers to profound philosophical questions, but elsewhere other schools evolved, each with its own ideas and followers, and significant advances were made in science and mathematics. In literature lyric poetry replaced epic poetry; instead of sweeping accounts of gods and heroes as in Homer's *Iliad* and *Odyssey*, this was personal, often very poignant poetry, filled with the range of human emotions. Archilochus, Alcman, Mimnermus, and Sappho all wrote at this time.

The shift in poetic style can be seen as a symptom of this new age, which was a time of political and social transformation. The poleis – the city states – were now consolidated, but the era was one of turmoil and revolution, as well as of greater individualism, as the work of the lyric poets demonstrates. At the beginning of the 7th century BC city states were typically ruled by aristocracies that were generally quite conservative in outlook and, in some respects, greedy and corrupt. Time had come for change, however, and in many city states this meant the adoption of tyranny. The first tyranny on the Greek mainland was in Corinth, where Cypselus took power from the noble Bacchiad family in the 650s BC, and most of the other major states followed suit, with the notable exceptions of Sparta, where two royal families continued to rule, and Athens, where tyranny came relatively late – in the mid-6th century BC.

The 7th century BC also represents a time of significant change in artistic style. This was the so-called Orientalizing period, when Greece accepted much influence from its eastern neighbours. It was the heyday of Corinth and it was there that the Geometric style first came to an end (c.720 BC) to be replaced by a new Orientalizing ware known as Protocorinthian. Both incision and polychromy were used to great effect and new motifs, generally inspired by the east, made their appearance on the pottery: floral motifs were employed, as were representations of real and imagined creatures such as lions, sphinxes, and griffins. Corinthian artists are especially known for their miniature pots; exquisitely decorated and filled with oils and perfumes, these were bound for export not only within Greece itself but also to the colonies, and they attest the pre-eminent economic position enjoyed by Corinth at this time. By the later part of the 7th century BC, however, Protocorinthian pottery became mass produced, a victim of its own success, and with this a noticeable change, not to say decline, set in. By the time that the so-called Corinthian ware (the successor of Protocorinthian) had established itself towards the end of the 7th century BC, Corinth's position of wealth and economic dominance was waning and would soon be eclipsed by Athens, whose fortunes were on the rise.

The Orientalizing period also saw the appearance of the type of sculpture known as Daedalic. The eastern, particularly Egyptian, characteristics of such sculpture are obvious in the very stiff frontal pose of the figures, depicted with arms at their sides and heads with triangular faces, low foreheads, and stylized hair. These statues were the forerunners of the famous *kouroi* (male) and *korai* (female) statues of the 6th century BC.

Sculptures are often associated with sanctuaries that themselves grew and prospered throughout the 7th and 6th centuries BC.

emphasis on public religion had begun in the geometric period, but it was in the 7th century ^{BC} that the temple became the religious focus of poleis all over the Greek world. Essentially a home for the deity, the temples, which had started life as wood or mud-brick constructions, some as early as the 8th century ^{BC}, were now built of stone and followed newly defined rules of architecture – the Doric and Ionic canons. The typical Greek temple comprised three rooms and had a colonnaded porch that surrounded the building. Besides the individual temples built in the poleis there were also the great Panhellenic sanctuaries that received worshippers from all over the Greek world and which were also venues for various types of competitions, particularly athletic and musical ones. The most famous of these sanctuaries were Delphi and Olympia, but others, such as Isthmia, Nemea, Delos, and Dodona, also enjoyed widespread renown. Delphi was known particularly for its oracle of Apollo and it acquired great prestige with visitors coming from all over Greece to receive advice and offer dedications there. Dedications, such as large bronze tripod cauldrons and figurines, demonstrate the popularity already enjoyed by Olympia in the later part of the Geometric period. As the home of the Olympic Games, the first celebration of which is traditionally dated to 776 ^{BC}, Olympia came to achieve a very prestigious position in the Archaic period. Treasuries as well as various other buildings, both religious and secular, were erected throughout the Archaic period at both sanctuaries.

In sculpture the 6th century ^{BC} was the time of the *kouroi* and *korai* which may, in general, be described as idealized portraits of young adults, the *kouroi* being nude males and the *korai* clothed females. Normally the *kouroi* stand stiffly, one leg slightly forward and their arms held tightly at their sides and, on their faces, the famous Archaic smile. These stone statues, many of which acted as grave markers, are often life-size or larger, but their features are not sufficiently distinct to be intended as individual portraits of the deceased; these are men shown in the prime of life – an idealization of manhood. With the *korai* the situation is somewhat different: many appear in sanctuaries as dedications and, while identification remains problematic, it is felt that some may represent votaries. The *korai*, which also show the Archaic smile, are normally clothed, and various colours are used to highlight clothing, hair, jewellery, etc. While these statues are very stiff and block-like when they first appear, the sculptors gradually develop a softer approach in their work and, by the Classical period, have achieved a great degree of naturalism.

One of the major developments of the 6th century ^{BC} was the re-emergence of Athens as the leading state after having lost its pre-eminence to Corinth for about a century. This dominance is seen

archaeologically in the appearance of Attic black-figure pottery which succeeded the proto-Attic style of the 7th century BC, itself characterized by Orientalizing motifs and an abandonment of Geometric conventions. The Athenian black-figure ware of the 6th century BC managed to surpass the Corinthian ware of that period and became as popular and widely exported as the Protocorinthian had been in the 7th century BC. Incision was used with such exactness and delicacy that finely detailed paintings were possible. Quite apart from the technical excellence of the pottery, the scenes that the painters chose have been an enormous and valuable source of information about all aspects of life, for Athenians are shown engaged in various everyday pursuits. Grape and olive picking are depicted, for instance, as are pottery making, sculpting, feasting, taking part in the Panathenaic Games (horse racing, wrestling, javelin throwing, etc.), going to school, and so on. Moreover these scenes have afforded glimpses of clothing and furnishing styles, of architectural details, and much more. Mythological scenes were also very popular and feature exploits of a number of heroes and deities such as Achilles, Ajax, Heracles, Athena, Poseidon, Dionysus, and the like. Signatures on the pottery help to identify individual potters and/or painters; among the most famous are Exekias and Amasis, both of whom were active in the 6th century BC.

Politically, too, Athens underwent great changes in the 6th century BC as the aristocrats were challenged, and although attempts at reform were undertaken, most notably by Solon in 594 BC, tyranny was established by Pisistratus in the late 560s BC. After twice being expelled, Pisistratus was able to take over power and command Athens until his death in 528/27 BC. Under his rule Athens flourished and, like his earlier Corinthian counterparts, he also patronized the arts and literature and did much to foster Athenian trade, commerce, and industry. The Acropolis became the centrepiece of Athens as the temple of Athena, the predecessor of the Parthenon, was begun. In general Pisistratus' reign was thus a time of peace and prosperity, but when his two sons took over power in 527 BC the character of the tyranny changed and became oppressive after one of them was murdered. The tyranny was finally overthrown in 510 BC and, two years later, in 508 BC, the Athenians developed a new type of political system, democracy, under the leadership of Cleisthenes. This gave the Athenian citizen a direct say in running the state. It should be noted, however, that women were excluded from this process. The polis system, and in Athens democracy itself, was male-dominated and women were segregated and confined to specific gender-related and socially acceptable roles. The rules governing the role of women varied, however, according to class and status as well as from place to

place; in Sparta, for instance, women enjoyed a much freer lifestyle as a result of Sparta's particular social system.

The end of the Archaic period is marked by the onset of the Persian Wars (490–479 BC), caused by the expansionist policies of the Persians. In these wars the two great Persian kings, Darius and then Xerxes, were defeated by a coalition of Greeks, although the brunt of the offensive was borne by Athens and Sparta. After the extraordinary naval victory of the Athenians at Salamis in 480 BC, the battles of Plataea and Mycale the following year mark the end of the Persian threat in Greece.

Archilochus

Lyric poet of the 7th century BC

Archilochus was born to an aristocratic family on Paros in the early 7th century BC, and his career and poetry exemplify trends in the Greek world during a period of great change in traditional social structures and attitudes. This was the era of Greek colonization and exploration in the Mediterranean and beyond, and Archilochus was a soldier and a wanderer, politically active, and involved in the later stages of the colonization of Thasos begun under his father, c.680 BC. Like Hesiod and the early lyric poets, his poetry moves away from the impersonal tone of Homer to one in which the individual is more prominent. The poetic persona that emerges from surviving fragments is consistently passionate, tough, practical, and impatient with pretension and traditional values: he appears as a devotee of war, poetry, women, drink, and, above all, survival.

Much of Archilochus' style and language is Homeric: no early poet could escape the influence of Homeric formulaic language, although Archilochus himself probably composed in writing rather than orally. Different from Homer is much of its subject matter and tone. The world of proud heroes and elevated expression gives way to one where the humbler details of subsistence in a harsh environment, quite absent from Homer, are given as much attention as loftier themes. One notorious poem records the loss of the poet's shield in combat with barbarians: the poem seems unbothered by what should have been a shameful loss – "let it go, I'll get another one just as good." Later sources allege that Archilochus' works were banned from Sparta because of such unsuitable content. Far away is the Iliadic view of death as a worthy end in itself: Archilochus' view is more that of an adventurer who fights for survival, not for glory and death. While such poems strike a new and un-Iliadic note, their atmosphere is not utterly dissimilar to that of the *Odyssey*, and Archilochus' persona resembles Thersites' in some respects. Very Odyssean is one poem in which he encourages his heart "neither to rejoice too much in delights nor be too vexed in troubles, knowing what sort of rhythm possesses

man". His attacks on grandiosity and pretension are sometimes thought to reflect a newer, more egalitarian spirit in the newly founded city states of the Archaic age.

Ancient critics consistently link Archilochus with two great predecessors, Homer and Hesiod. His literary power is said to resemble Homer's; his attitudes and subjects are closer to Hesiod's, though he takes his individualism to a greater extreme. He is also the earliest Greek poet to write specifically about sexuality, sometimes using obscenities that are entirely missing from Homer or Hesiod. He was especially famous in antiquity for an abusive iambic poetry whose forerunner was the apotropaic ritual abuse associated with the rites of Demeter, with whom iambic verse itself seems to have had a particular connection. Paros had an old Demeter cult with which Archilochus' family may have been connected. Such traditions also influenced mock-epics such as the *Margites*, and Aristotle makes iambic verse the antecedent of comedy. The obscenities in Archilochus can be remarkably mingled with tender romanticism, and this uniquely dual tone has made him very popular with moderns. In none of his poems is this duality more noticeable than in an unusually long fragment (Page, *Supplementum Lyricis Graecis*, 5478) in which an unidentifiable speaker tries gently to persuade a young woman to make love with him – when she suggests that her sister Neobule is more suitable for him, he abuses Neobule, calling her oversexed and past her prime.

The poem was a particularly important discovery, because of the most famous tradition about Archilochus. According to later sources, he was engaged to be married to Neobule, but when her father Lycambes broke the engagement off, he assailed the family with verses so vicious that they eventually hanged themselves. Nothing specific about the betrothal is found before Horace, but evidence from fragmentary comedy (Cratinus) suggests that the story was well known in 5th-century BC Athens. While some suspect that the story is fictional and derives from misunderstood ritual abuse, the names Lycambes and Neobule do appear in the fragments, and archaeological evidence has proved the reality of some others of Archilochus' addressees. Parian inscriptions indicate that both Archilochus and Lycambes were from leading families, and thus a proposed alliance between the two is plausible. Some of the Lycambes poems were expressed as beast fables, a form derived from Asia Minor that first appears in Greek literature in Hesiod, and later in Aesop. In these, Archilochus could give full rein to his anger while appearing detached and sardonic.

Archilochus' reputation abroad was that of a dangerous, angry man, but within Paros he posthumously acquired an almost heroic status.

An inscription of the 3rd century BC describes an Apolline command to honour Archilochus along with the Muses, Apollo, Dionysus, and others, in a place dedicated to his memory. While it admits that the Parians banished him for his abuse, it also mentions the mass attack of impotence sent on them by Dionysus as a punishment for the banishment, and portrays Archilochus as a poet under divine patronage, whose immortality was prophesied to his father by the Delphic oracle. A later inscription, a biography of Archilochus by Demeas (a Parian historian of the 4th century BC), records his death in battle against the Naxians. Such inscriptional evidence tells of participation in embassies and battles, and the Parians apparently remembered him as more community-minded than his fiercely individualistic reputation would suggest: only a few fragments of songs with a community emphasis now remain.

The brilliant violence of his verses brought him admiration for his talent and condemnation for his subject matter in equal measure. Pindar condemns Archilochus' anger as unattractive and unproductive, but he was popular in 5th-century BC Athenian comedy: his apparent rejection of establishment values and pretension made him attractive to the democracy. Plato mentions him in the company of Homer and Hesiod, but does not recommend his writing as edifying. He was the subject of treatises by Heraclides of Pontus and Aristotle, and the Alexandrians included him in their canon of iambic poets along with Semonides and Hipponax. Apollonius Rhodius wrote a book about him, and while Callimachus mentions his ferocity with apparent disapproval, his own iambics were a kind of Archilochean revival. Aristophanes of Byzantium and Aristarchus of Samothrace wrote commentaries on the poems, but unsurprisingly they were omitted from the educational syllabus of later antiquity because of their tone and subjects. Archilochean papyri date from the mid-3rd century BC to the 3rd century AD. The early Church Fathers preserve some references and quotations: for them, Archilochus was undeniably great but a thoroughly bad character, all too typical of pagan behaviour. The emperor Julian forbade priests to read his work. It is probable that his poetry survived plentifully at least to the 5th century AD, but after Eusebius little is heard of him for the next few centuries. It is hard to know how much survived as far as Byzantium: such quotations as we have may well derive only from anthologies. The first Renaissance edition of his poems is Henri Estienne's *Carmina Poetarum Novem Fragmenta* (Paris, 1560).

SOPHIE MILLS

Biography

Born on Paros in the early 7th century BC to an aristocratic family, Archilochus left in

disgrace for Thasos where he became a mercenary, eventually dying in battle against the Naxians. Probably the first major literate poet of the Greek world, he was ranked with Homer and Hesiod by ancient critics; but there is far more passion in his verses than in those of his predecessors.

Archimedes c.287–212/11 BC

Mathematician and inventor

Archimedes was killed in the Roman sack of Syracuse in 212 or 211 BC, which gives us one of the few firm dates in the history of ancient science; if, as a 12th-century Byzantine author reports, he was 75 years old at the time of his death, he would have been born around 287 BC. His father, Phidias, was an astronomer, so that for Archimedes science was the family trade. He came from Syracuse, and did most of his work there, at the court of king Hieron II (and at least some of his writings were originally composed in the Doric dialect spoken in Syracuse); he also seems to have spent some time in Alexandria, and corresponded with the mathematicians Conon, Eratosthenes, and Dositheus, who were based there.

Both in antiquity and in the modern world Archimedes has principally been famous for two reasons: because of the ingenious mechanical devices he is alleged to have discovered; and through anecdotes representing him as the archetype of the scientist so absorbed in his work that he forgets about ordinary life. So it is reported that he would forget to bathe, and when his friends persuaded him to do so he would draw geometrical diagrams in the oil

on his body; his death in the sack of Syracuse is said to have been brought about because he was so preoccupied with a geometrical problem that he spoke rudely to the soldier who came to capture him; most famously, while in the bath he reached a solution to the problem of how to find out whether gold that had been given to a craftsman to make a crown had been adulterated with silver, and was so excited that he forgot himself and ran naked through the street shouting "I have found it!" He is credited with the invention of a number of ingenious engineering devices. He is said to have supervised the construction of a massive 4,200-ton ship for Hieron II, and, when it was finished and no one knew how to launch such a large vessel, he supposedly devised a system of pulleys by means of which he was able to move it single-handed; this is of course impossible, because real pulleys (as opposed to mathematical concepts) waste energy through friction, and the whole story is perhaps a fiction designed to illustrate his work on mechanics, and particularly his saying "Give me somewhere to stand and I will move the world." Better attested is his construction of a number of moving models of the celestial sphere. He was also reputed to have invented the Archimedean screw (a device for raising water) and a hydraulic organ. The difficulty that the Romans had in capturing Syracuse was explained by the formidable defence put up by the war-engines devised by Archimedes. In itself this is quite plausible, since in the Hellenistic and Roman periods mathematicians were involved in the construction and use of such machines as catapults. The account was, however, embroidered as time went on, and by the 2nd century AD we are told (by Galen) that he used burning mirrors to set on fire the Roman ships. The story became a favourite one for Byzantine writers, and indeed we are told that in AD 514 the philosopher Proclus used exactly the same technique to drive the fleet of Vitalian away from Constantinople. Though the report is not plausible, and is surely based on inferences from Archimedes' work on the geometry of optics, repeated attempts have been made to show that the device could work (most recently by a Greek journalist, whose practical demonstration, though spectacular, failed to convince sceptical historians that a burning mirror could be made into a practical weapon of war).

Archimedes' interesting eccentricities, and his engineering achievements, tended to obscure the importance of his mathematical work. So when the Roman Cicero, as quaestor in Sicily in 75 BC, rediscovered the tomb of Archimedes overgrown with thickets outside Syracuse, he reported that it carried on it a representation of a sphere and a cylinder. He seems, however, to have had no idea that this represents Archimedes' discovery of the ratio of the volume of a cylinder to that of a sphere inscribed within it (*On the Sphere and*

Cylinder, 1. 34). Archimedes, in fact, was not only a great mathematician, he is also the only one of the truly creative mathematicians of antiquity whose work survives to any extent (since the surviving writings of Euclid and Apollonius of Perge are largely systematizations of the work of their predecessors). In pure mathematics, his greatest work is probably *On the Sphere and Cylinder*, on the volume and surface area of spheres and segments of spheres. Other works in the same field are: *On Conoids and Spheroids*, which deals with the solids created by the revolution of conic sections; *The Quadrature of the Parabola*, which is on the area of parabolas; *On Spirals*, dealing with the geometry of the so-called Archimedean spiral; and *The Measurement of the Circle*, which calculates upper and lower limits for the value of π . In these works Archimedes uses the methods of his predecessors, and especially Eudoxus' "method of exhaustion" with great ingenuity, and sets out his results in traditional Euclidean form. Another surviving treatise, *The Sand-Reckoner*, purports to be a calculation of how many grains of sand it would take to fill the universe, but is actually a demonstration of a method of writing very large numbers using base 100,000,000. He extended the scope of mathematical method by applying it to statics in *On the Equilibrium of Planes* (on centres of gravity and the theory of the lever) and to hydraulics (a subject he seems to have invented) in *On Floating Bodies* (known only in Latin translation until a Greek text was discovered in 1899).

Archimedes' account of his work in the prefaces to his treatises makes it clear that the discovery of a mathematical proposition, and the method by which it was discovered, was quite separate from the presentation and publication of the proof in Euclidean form. In 1906 a previously unknown work of Archimedes, *The Method*, was discovered in Constantinople on a parchment of the 10th century, which had been partially erased so that a Eudologium could be written over it. In this work Archimedes shows how he originally discovered a number of the propositions that are set out in Euclidean form in his other works. He treats figures as combinations of infinitely thin strips, to which the methods of mechanics can be applied, and to some extent anticipates the methods used by the discoverers of calculus in the 17th century. Archimedes himself regarded the method as insufficiently rigorous (and so published proofs in more traditional form). The discovery of this work gives us a rare opportunity to see one of the greatest creative minds of antiquity in action.

Some time in late antiquity (probably in the 6th century AD) the more elementary of Archimedes' works (and in particular *On the Sphere and Cylinder* and the *Measurement of the Circle*) were translated from Doric into Attic Greek, presumably to make them more

accessible to readers. This development may be associated with the school of Isidore of Miletus (one of the architects of Hagia Sophia in Constantinople), and is evidence of the continued use of at least some works of Archimedes in education. It was, however, not until the 9th-century revival of the study of mathematics in Constantinople that a proper collection of his works was made, which is the basis of the texts we have today.

RICHARD WALLACE

Biography

Born c.287 BC in Syracuse, Archimedes was the son of an astronomer. He worked mostly in Syracuse at the court of Hieron II, but he also visited Alexandria. He is best remembered for the many engineering devices he is said to have invented, but he was also one of the most creative mathematicians of antiquity. He died in the Roman sack of Syracuse in 212 or 211 BC.

Architecture

Domestic

Domestic architecture describes the space in which people live as private individuals and, generally, as part of a nuclear or extended family. Houses, often the least documented buildings in history, are part of an organic architectural fabric that over time continuously changes and adapts to the inhabitants' ever-evolving needs and desires. Houses are also primarily the domain of women, since women usually decide the arrangement of domestic spaces, keep them in good order, and tend the animals and garden that might form part of a household. Furthermore, beyond providing shelter and a space for familial gathering, houses may also accommodate religious, commercial, manufacturing, or agricultural activities that involve the extended family. In some cases, groups of families and individuals live together in multi-family buildings, thus blurring the line between private and public spheres. A review of domestic architecture through time elucidates not only the conditions of daily and family life, but also the broader context of historical, technological, and economic change. The stylistic details of a house reveal cultural alliances and influences, both within the community and in a broader geographical

context. At the same time, however, domestic architecture is markedly conservative and resistant to change. Building methods and the arrangement of space both exhibit a tenacious attachment to traditional materials, techniques, and practices, which are primarily dependent on local resources and climatic conditions. Dramatic changes in building practices are invariably the outcome of major economic, political, and demographic restructuring.

Our knowledge of Classical Greek houses is derived primarily from the 1930s excavations of Olynthus, a town in Chalci-dice that was founded in 432 BC according to the Hippodamian manner. While the orthogonal street grid resulted in the erection of buildings in blocks of equal size, housing lots varied slightly in size, undoubtedly the result of individual agreements among landowners. The ground space of a typical residential block was roughly a square measuring 17.2 metres per side. Larger houses had five to seven rooms, smaller houses had one or two. All had a small, interior, south facing courtyard, where many of the daily activities took place, notably cooking and often weaving. Several of the courtyards also had permanent altars, commonly dedicated to Zeus Herkeios. The houses were constructed of unbaked bricks, on a foundation of rubble. Pillars were mostly wooden, while the sloping roofs were covered with tiles. Water was supplied from the city cisterns or occasionally by a private cistern.

Athenian houses of the 5th and 4th centuries BC bore an affinity with those of Olynthus both in arrangement and in materials. Due to the irregular street pattern of Athens, however, both the houses and the rooms themselves were irregular in size and shape. The rooms of Athenian houses were arranged around a small, usually south-facing courtyard that could be reached either directly from the street, or through a narrow passage. In fact, the courtyard pattern is characteristic of most ancient Greek houses. Some courtyards had a porch supported by columns, on one or more sides. They were later paved with pebbles set in cement, while most floors were made of hard earth topped with clay. The walls of the principal rooms were covered with plaster and painted with a light colour wash. Literary sources frequently refer to the second storey of houses, though none has survived.

Despite the number of passing literary references to the different spaces, and their uses, within the ancient Athenian house, it is still impossible to match these descriptions to archaeological findings. For example, while texts make references to separate men's quarters (*andron* or *andronitis*) and women's quarters (*gynaikonitis*), archaeologists have been unable to identify such specific locations as little evidence exists of the character of individual rooms. This may also indicate a certain versatility of function among the rooms,

depending on the season or on the special needs of the household. Another clear social distinction, that between free and slave inhabitants, is also absent from the physical remains of Athenian houses. Presumably, all men slept in the men's quarters and all women in the women's.

Women's work was confined to the house and included the care of children, the cleaning of the house and its contents, the preparation of meals and the processing of food for storage, as well as spinning and weaving to make clothing and bedding. Many professional men also used their house as a place of business. Marble cutting, pottery making, or metalworking often took place in the courtyard. Rooms that opened directly on to the street were used as offices, workshops, retail shops, taverns, or warehouses. Wealthier and poorer housing quarters were not necessarily mutually distinct. Finally, the majority of Greek towns, including, to an extent, Athens, were home to farmers who worked the surrounding countryside. Wealthier city dwellers maintained handsome residences in the countryside as well. These were not only more spacious than most of the town houses, but also more regular in plan, as the space occupied by town dwellings was restricted by the irregular street pattern.

New socio-economic conditions during the Hellenistic period brought about the creation of a new urban class of merchants, manufacturers, retired soldiers, and civil servants who prospered in the unified Hellenistic world of the Mediterranean basin and who were able to afford larger and luxurious villas. Architects experimented with new building methods and artistic trends, creating impressive domestic complexes. The layout of Hellenistic houses is similar to that of the houses at Olynthus, but larger and more elaborate. The finest surviving examples of the period are found on the island of Delos, a major mercantile centre at the time. Rooms were arranged around an interior courtyard, usually a complete peristyle with elongated Doric columns. The courtyard and the floor of the principal room often featured mosaic decorations. In the Roman period many of the houses also had an atrium, in addition to the peristyle court. As the Greek and Roman cultures infiltrated each other, their domestic worlds also grew more similar.

In the cities of the late Roman empire the apartment house (*insula*) was a more common housing type than the individual dwelling (*domus*). Two *insula*-type buildings have been unearthed in Ephesus. Constructed in the 1st century AD, they underwent several remodellings until the 7th century. There were vaulted shops on the ground floor and modest rectangular rooms on the upper floor, while a two-storey mansion formed a component of one of the *insulae*. Literary sources also confirm the existence of *insulae* in Constantinople. In fact,

residents of a five-storey *insula* complained when some of their neighbours kept pigs in the upper storeys. The individual dwelling (*domus*) continued to be based on the central peristyle courtyard surrounded by rooms and other service areas. These included a bath, kitchen, latrines, plumbing and heating systems, and storage rooms.

Building laws regulated the construction of new houses or the remodelling of existing ones (*Codex Justinianus*, 8. 10. 12). A distance of at least 12 Greek feet had to be maintained between houses. Repairs to old houses were allowed, provided the original plan was not altered. New buildings had to respect neighbours' access to daylight and, especially in Constantinople, view of the sea. Balconies could only be built on streets that were over 12 feet wide, and exterior staircases from the street to the balcony were not permitted, as they could obstruct traffic and pose fire hazards.

Fortifications

Over the centuries in the Greek world the art of fortification struggled to keep pace with methods of attack; in the long term the attacker prevailed. At times the consequent catastrophes were overwhelming, and the systems being defended collapsed, resulting in a complete regression before the process started again. Therefore no constant line of development and improvement can be traced. In addition, these aspects of warfare did not occur in isolation; external developments,

new ideas brought from outside the Greek world, affected the systems employed in Greece.

The Minoan world appears to have eschewed the use of fortifications. There are no walls around the Cretan cities, implying a surprising degree of stability and peacefulness among the various communities on the island. By contrast, the mainland citadels of the Late Bronze Age were fortified, and with the passing of time these fortifications were steadily strengthened. The walls enhance the strength of places already chosen for their steep sides and difficulty of approach. Generally, they are built of massive, irregularly shaped blocks of stone that rely on their sheer weight to keep them in place and the walls intact; this may imply that attack using battering rams was anticipated, and in any case there is no doubt that the massiveness was designed to impress and so deter any would-be attacker. The systems grew up more or less fully fledged, indicating that their origin is to be sought elsewhere – without doubt the even more massive defences of the major Hittite sites, such as Boğazköy in central Anatolia. Gateways were strongly defended, projecting bastions being used to provide flanking protection to the actual gate, which, at Mycenae in particular, was given massive jambs and a lintel surmounted by the famous sculptured slab depicting heraldic lions facing a pillar.

Repaired where necessary (and invariably with less massive masonry), these walls served for centuries the communities that emerged from the collapse of late Bronze Age civilization. New fortifications were rare during the early centuries of the 1st millennium BC. The best example is the walls of Smyrna, in which a high footing of carefully fitted stone surmounted by a thick superstructure of mud brick protected the city from landward attack. This dates from the late 9th or early 8th century BC, and was renewed and replaced until the end of the 7th century BC, when it had to defend the city against an attack by Alyattes, king of Lydia, who brought with him the techniques of siegecraft developed by the Assyrians, particularly overtopping the walls by constructing against them a huge siege mound. Against this the fortifications were helpless, and the same is true a little over a century later, when the Persians used a similar mound against the Cypriot Greek city of Paphos, despite strenuous attempts by the Paphians to undermine the mound by tunnelling.

Within Greece itself this siegecraft was not developed. During the 5th century BC city walls were sufficient to keep out attacks by other Greek forces. In particular, the heavily armoured infantry (hoplites) were too unwieldy, and the risk of losing citizen lives too great. Many cities therefore defended themselves with walls, using stone footings

(generally with inner and outer faces only, and a rubble and clay fill) and a super-structure of mud brick. The only practical method of attacking such a wall was to surround it and starve the defenders into submission. This was circumvented by Athens, which linked the city walls with those of its harbour, Piraeus, by means of long walls running the full 7 km between the two places, and then using its command of the sea to import food, protecting the inhabitants from starvation.

Important developments took place in the 4th century BC. Techniques of siegecraft were improved, partly by the introduction of Near Eastern methods, partly by the increased use of specialized non-citizen troops. Siege engines began to be employed, and in consequence the fortification systems had to be strengthened. A crucial development resulted from the victory of the Boeotians over the Spartans in 371 BC. Messenia was liberated, and the Boeotian leader hurriedly created a new strongly defended city at Messene. A huge circuit of more than 6 km was completed within months, allotted section by section to a multitude of constructors. The wall is made throughout of stone, with outer faces of strong rusticated masonry and rubble fill. The most significant development is the addition of towers at regular intervals, to carry missile-throwing engines and archers who could prevent an enemy reaching the curtain wall itself. Gateways were particularly strong; a good example is the Arcadian gate, flanked by towers, an outer gateway giving access only to an inner circular forecourt in which an attacker would be surrounded before being able to reach a second inner gate. Such systems began to be found in other places. In Boeotia itself there is a smaller version at Siphae which is backed by a system of free-standing watchtowers of similar construction.

Some experimentation can be seen in the methods used to build the walls. With the likelihood of direct assault on the fabric of the walls, it was found that a rubble fill might contribute to total collapse if the outer face was dislodged. Different fills, such as packed mud brick, and dividing the interior of the wall into compartments by using through stones binding the inner and outer faces together at intervals, were tried. At the same time, siege engines improved. Philip of Macedon and, especially, Alexander the Great had formidable arsenals of such weapons. Alexander's engines were thwarted only by the walls of Phoenician Tyre, of extra large blocks and gypsum mortar, until he found a weak spot that he could attack by sea. By the end of the 4th century BC systems were extremely sophisticated, but even the walls of Rhodes, strengthened by internal arcaded buttressing, were breached by the elaborate siege engines of Demetrius, and only a desperate defence saved the city. Demetrius' siege engines included a massive

mobile tower called the Helepolis, the Taker of Cities, which earned him the nickname of the Besieger; Rhodes was his only failure.

Thus the final phase of Hellenistic Greek fortification had to be designed to keep the siege engines at bay; once they reached the wall, it was virtually doomed to collapse. This was done by providing taller towers that held whole batteries of counter-siege engines, enfilading the wall as well as firing outwards, and by constructing outer systems (*proteichismata*) of secondary walls with deep ditches in front to prevent the heavy and cumbersome engines of the attacker getting close enough to the walls. Parts of the *proteichisma* of Athens, recently excavated, have in front a sheer-sided ditch 6 m in depth. The strongest and most elaborate of these systems was built late in the 3rd century BC at Syracuse in Sicily, designed by the great scientist Archimedes, but even this failed, after a bloody siege by the Romans.

Despite this, most Hellenistic cities were surrounded by fortification systems so extensive that many of them are well preserved. There are excellent examples at the Greek or Hellenized cities of Asia Minor. Heracleia by Mount Latmos, close to Miletus, is a good example. Miletus itself must have had similar walls, and one of the largest circuits is that at Ephesus. Both Heracleia (a small city) and Ephesus have walls that, like those a century or so earlier at Messene, include a much vaster area than needed for developed habitation, either anticipating expansion or, more likely, leaving room to receive people evacuated from the surrounding countryside in time of war. The walls of Ephesus certainly, and probably also Heracleia, were built for the Successor king Lysimachus, who took over the region after the battle of Ipsus in 301 BC. The walls are of good ashlar, built on the compartment system. Where they run up hillsides, the rock is carefully trimmed in steps to receive the blocks, lowers are generally square, but there are some circular ones, including at Ephesus a massive tower towards the seaward end of the wall. Such walls serve a variety of functions, even if it must have been accepted that they were bound to succumb to a protracted siege vigorously maintained. They certainly gave routine security against brigandage and small-scale attack, but, most important, they gave their possessors a sense of pride. At some places, such as Perge in Pamphylia, one gets the feeling that the walls, and especially the main gate, were intended as much to look impressive as to be militarily effective.

With the development of Roman authority, military needs changed. The Romans learned their siegecraft from the Hellenistic Greek specialists. The engineers who developed the siege engines worked in a Hellenistic context. Vitruvius, who was Julius Caesar's engineer, certainly knew the engines invented and described in treatises by his Hellenistic predecessors, to whom he refers in his own *De Architecture*.

Methods of fortification were vastly improved by the development of concrete construction techniques, which at last made the fill so permanent and durable that any outer facing employed was for decorative purposes only. Moreover, the extension of the empire and the creation of the Pax Romana removed the need for fortifications from the cities of the Greek world. Where walls were retained they were obviously for secondary purposes only, local security, and local pride. The real defence was on the frontiers of the empire.

The incursion of invading peoples into the Aegean area in the 3rd century AD brought a sudden reversal of this situation. Many places were to all intents and purposes undefended. Athens was attacked and sacked by the Heruli in AD 267. A new system of defence was necessary. This had to take account of the fact that a Greek city like Athens no longer had a significant army of its own, or Roman troops to help. It would have to rely on its own limited resources, and this meant that it could no longer hope to defend a circuit as long as that which had surrounded the Classical city, and which, though ruined, survived in part. A new circuit was therefore created, considerably reducing the length of wall and the area defended. This can be seen most clearly in the Agora, most of which was now outside the wall – generally referred to as the “Valerian” wall, after the contemporary emperor at Rome – but this in no way implies that it was an official imperial creation. The wall itself is plainly makeshift. It was made from reused elements of demolished Classical buildings, forming a line of solid but unmortared masonry. At sections, it includes actual buildings; the stoa of Attalus, at the eastern edge of the Agora, survived relatively well preserved because its main structure was incorporated into the new defences. The Agora itself was razed almost completely, not by the Heruli but to create an open zone devoid of cover for an enemy in front of the wall. Beyond this area, the temple of Hephaestus remained intact. The wall ran up to the entrance of the Acropolis. No attempt was made to refortify the Classical Propylaea; instead, a new gate with a small opening and flanking bastions was created, again from reused material, a little below. Everything looks makeshift. It is not constructed according to the latest systems of military works, and, except in so far as it reuses material, it is not a revival of older Classical systems. The city soon redeveloped to include areas outside this wall, but sections of it, particularly on the Acropolis, remained to be incorporated into later medieval fortifications.

Athens in the 3rd century AD is an example of what a Greek city was able to achieve relying entirely on its own resources. Constantine's city of New Rome, Constantinople, represents the opposite extreme, fortified with the full resources of the imperial authorities. The main

landward wall, the Theodosian, was laid out in the early part of the 5th century AD. It was built largely of mortared stonework, with regular stringcourses of brick, in the manner that had evolved for Roman concrete construction at the time of the early empire; the obvious comparison is the walls built in the 3rd century AD by Aurelian at Rome. It incorporates larger blocks of stone, for decorative effect rather than necessity, and where a special effect was felt appropriate, there are elements completely faced in good squared masonry; this was particularly so at the Porta Aurea, the great Golden Gate. Such masonry here was a direct revival of the appearance, at least, of the Classical and Hellenistic walls. The wall itself had a regular series of tall towers, placed at intervals of 50 or 60 m. Most were square, some were octagonal, mostly occasionally but near the Golden Gate alternating with the square examples. In front of the wall was a *proteichisma*, lower, but like the main wall, battlemented. It also had towers, but these were not much higher than the wall itself. In front of this was a deep ditch, vertical sided, the sides being supported where necessary by masonry. This was a strong system. Maintained, but not essentially altered in character, it survived as the main defences of the city, and sufficed for resistance to all attacks, perhaps the longest survival of a defensive system, until the Turks set about it with cannon and gunpowder in 1453. Yet, apart from the use of mortar in its construction, it was little modified from the Hellenistic walls of the 3rd and 2nd centuries BC. All the elements in its layout are found in the walls of Hellenistic Athens, and, particularly, in Archimedes' great defences at Syracuse. It is an important example of a continuing military tradition.

Military, and Masonry Developments

Military architecture from the ancient world survives in the form of city walls and citadels, and linear walls with towers. The main features of ancient fortification can best be seen in Greek wall building.

City fortification is probably as old as the formation of the city

itself. Herodotus tells us that the seven walls of Ecbatana, built in the 9th century BC, were concentric, and towers can be seen on Assyrian reliefs depicting military sieges. A well-preserved early example of city walling is at the Hittite capital of Hattusas, Boğazköy in Asia Minor. It has an earth glacis or berm lined with stone at the base of the wall. On the top was either wooden palisading or mud-brick walling. The warring Greek city states improved on these examples, adding their own innovations.

The Lion Gate at Hattusas has a straight principal entry, like the Lion Gate at Mycenae, and both these gates were strengthened spiritually by the presence of the religious sculptural decoration. The idea of a spiritual aid to defence continues into the Byzantine period, when gates were dedicated to Christ or the Mother of God or to a saint. The gates or guardian towers often had a chapel incorporated in them, usually on the first floor.

The Lion Gate at Mycenae testifies to the importance attached to the defence of city gates. It was placed at an angle in the walls so that attackers approaching the gate on the road beneath were subject to flanking fire before they actually reached it and, in addition, it has a defensive bastion on the opposite side to the city wall. The obvious importance of the gate to any fortification is echoed by literary tradition which describes how each of the seven leaders in the Theban war was in command of the attack on one of the seven gates of the city, and that six of them were killed. At Troy a legend has it that Achilles was wounded by an arrow in the heel while attacking the Scaean Gate, which suggests defensive fire from a flanking bastion. By the 4th century BC the more developed form of a gate flanked by two defending towers can be seen at Messene. This type became the standard defence to the principal gate of many cities in the Greek, Roman, and Byzantine periods, since such towers offset the weakness of the gate itself. At the same time they provided protection for an orderly sortie of counterattacking cavalry or infantry. In times of peace, such a gate was also used for important fêtes and processional purposes. Two other forms of gateway appear in Greece from the 5th century onwards. The bent gate forces an enemy to turn a corner between heavily defended walls before he reaches the gate. A development of the bent gate in Byzantine and crusader times provided for a second or even a third bend inside the principal gate so that, if the besiegers broke it down, they still lacked clear access to the town or citadel that they were attacking. The postern gate served the defenders as a secretive means of communication with the outside world and as a means for covert counter-attack. A postern gate appears at Hattusas, Boğazköy, and was not an invention of the Greeks, but it became a regular element in Greek, Roman, Byzantine,

and Frankish fortification.

Walls and towers antedate ancient Greece, but from the Bronze Age onwards the Greeks made great developments in wall construction. Early Cyclopean masonry can be seen at Tiryns and Mycenae. It is typified by the use of huge blocks of irregular masonry shored up by smaller stones and backed by earth and rubble. From the 5th century ^{BC} onwards there was a rapid development of masonry types. For their strength these mainly rely on the masonry surfaces of the wall, which were backed up by a core of earth and rubble and could absorb the shock of a missile or the impact of a ram. The surface blocks were made of regular ashlar fitted closely together. The setting pattern for these blocks developed in the Classical period. Instead of regular blocks laid in horizontal courses with the long side outwards, a pattern of headers and stretchers was developed that greatly strengthened the wall. The headers went deep into the earth and rubble core and gave much greater stability. This type of walling, known as casemate walling, probably derives from timber bonding, which was used in mud and masonry walls from the time of the Old Testament onwards (1 Kings 6: 36). A second development was the use of embossed masonry, which can be seen in the 4th-century ^{BC} fortifications of Aegosthena and Messene. Whereas ashlar blocks had a smooth surface, the embossed block had smooth margins at the edges while the rest of the surface was rough hewn and irregular. It was designed to dull or deflect the impact of missiles. Its efficacy is reflected in its long history that ends only with the decorative use of it as rusticated masonry in the Baroque period in western Europe.

The early historical development of masonry that makes use of lime mortar as opposed to earth has yet to be charted. It is of vital importance not only to military building but to all architecture since lime mortar transformed the wall into a single strong structural component; earlier, it had consisted of the two elements of fitted surface blocks with an interior core of earth and rubble filler. Vitruvius names an early type of lime mortared walling – *opus incertum*. He remarks that this walling is much stronger than *opus reticulatum* and attributes it to the Greeks, and says that it is not to be made light of. Philo of Byzantium, writing in the 2nd century ^{BC}, refers to mortars and to the use of *gypsos*, which may be gypsum rather than lime. However that may be, his lack of emphasis on the use of lime suggests that he did not fully understand its potential. It was the Roman military engineers and builders who made the greatest advances in the use of lime mortars and lime concrete, and their technical advances were in turn made use of by the Greeks in the Byzantine period. The massive Slav invasions of Greece from the 5th century onwards and the Persian invasions of Asia Minor in the 5th

and 6th centuries AD followed by the Arab invasions in the 7th to 9th centuries, saw the transformation, and often the virtual destruction, of the great Greek and Roman cities of the plains. There was a need for rapidly built and efficient defensive walling, and the type of masonry favoured by Byzantine military engineers was the Vitruvian *opus incertum* or mortared rubble wall, with a bonding system of either brick or timber. This could be constructed under the supervision of a military engineer with the use of unskilled labour, most probably the soldiers themselves with the help of forced levies of the local population to bring in stones. It did not require a large force of skilled masons to perform the slow task of shaping ashlar for the smooth surface of a wall. Nor did it require stone suitable for cutting and shaping, since any shape or size of stone could be firmly bedded into the wall mortar with its smoothest face to the outer surface. The outer surface of the wall was protected from water penetration by a shelter coat of lime plaster. In the Byzantine period from the 6th to the 15th century there are numerous examples of *opus incertum* military walling scattered throughout Greece, the Balkans, and Asia Minor. Unlike ashlar walling, *opus incertum* does not look elegant or impressive, and it is difficult to date unless it incorporates inscriptions, brick bonding courses, or decorative features. It has not attracted much attention from Classical scholars because it is not aesthetically pleasing, but its legacy was of fundamental importance not only in military architecture but in all workaday building in the medieval and modern world until Portland cement replaced lime mortar.

The two main categories of military architecture lie in the defence of cities and the defence of frontiers. In the siting and defence of cities the Greeks carried on an ancient tradition of using naturally defended sites: either around a hilltop as at Mycenae, or in the case of ports by using natural ravines. Such natural defences could be improved by rock clearance or ditching. The Greeks concentrated on the development of hilltop citadels such as Aegosthena or Acrocorinth to serve as a final stronghold if the walls of the city were to fall. A Greek city in the plains such as Mantinea was an exception that only became the rule after the Roman conquest; it was not until the 3rd century AD, with the Gothic invasions, that there was an enemy of consequence. In the Byzantine period cities often reverted to Hellenistic hilltop sites and it is not uncommon to find a city with the original Greek ashlar masonry at the base of the wall and Byzantine mortared rubble masonry in the higher courses.

Linear fortifications were used at Athens to link the city with its port and at Acrocorinth to link city and citadel, but they were more suited to frontiers or to the creation of walled mountain refuges that sheltered the whole population of an area with its livestock. Thus the

walls of Messene enclose not just a city but a whole landscape. During the Peloponnesian War a defensive wall across the base of the peninsula was planned. Another example is the Byzantine long wall of Thrace.

In both city walls and linear fortifications towers were a regular feature. But once again it was the Greeks of the ancient world who seem to have made the most significant developments in the construction of towers. Early towers seem to have been an integral part of wall construction. They were conceived as vantage points, higher than the adjoining wall, and by projecting a little they acted as buttresses from which flanking fire could be directed upon the attackers. By 304 BC towers that were structurally independent of the walls had been developed. At Rhodes Demetrius Poliorcetes destroyed the curtain wall to either side of a tower, but he was unable to take the tower itself. The text of Philo of Byzantium on the subject of towers is ambiguous, but he does appear to suggest that some towers were structurally independent of the walls, and that they were heightened by the addition of a smaller turret on the top level. The archaeological evidence for the upper work of towers is lacking since none survives intact, but in the 6th century AD Procopius describes independent tower keeps that were forerunners of the medieval keep. No Byzantine examples survive, but their existence is suggested by 16th-century Ottoman examples, such as the White Tower at Thessalonica, and the three great towers of Rumeli Hisar outside Constantinople. In the individual forms of towers and in the traces of walls the ancient Greeks were also innovators. They built towers that were rectangular, round, and U-shaped. Philo of Byzantium seems to recommend the pentagonal, prow-shaped tower. Its pointed shape served well to deflect missiles, and it was a favourite choice in Byzantine fortifications. A version even survived to form a part of artillery fortifications from the 16th century onwards. Philo of Byzantium also describes a wall traced on the pattern of saw teeth. A good example is the 9th-century walls of the Byzantine city of Ankara.

The surviving evidence of military architecture thus shows that the ancient Greeks and the Byzantines were important developers in this field, and sometimes skilled innovators.

Palaces

If palaces are defined as buildings that served as a residence and place for fulfilling the administrative duties of a ruler, it is obvious that they will not form a significant element in the architecture of Classical Greece, since at that time monarchy was not a normal political system. At other periods, before and after, the picture is different. The prehistoric societies of Greece, in their developed forms, depended on a complex, centralized administration which, presumably, was under the supreme control of individuals, though, apart from the palaces themselves, the only evidence for this is in later legend, with all the dangers of distortion that implies. There are two main types of palace found in the Bronze Age communities of Greece, the Cretan (Minoan, in the archaeological terminology invented by Sir Arthur Evans, who excavated the greatest of them, at Knossos) and the mainland (Mycenaean). Since we have no written record of how these presumably monarchical states functioned, other than references to authority in the Linear B tablets, interpretation of their palace architecture has to be based on the buildings themselves.

The palace at Knossos comprises areas that can be assigned with some certainty to residential purposes and others that functioned as storerooms, workshops, record office, and thus administrative functions; and others, less easily understood, that were probably designed to accommodate some, at least, of the religious functions of a monarch. The structure developed over a protracted period of time, punctuated by natural disruptions, particularly earthquake, before final destruction some time in the 14th century BC. The placing of the various elements round a central courtyard (a regular feature of the Minoan palaces) gives a superficial appearance of unity; in fact, it is clear from the archaeological evidence that the palace was rather the result of piecemeal development. There is no simple unity to the plan: the different sections have their own organization, and, generally, their own separate routes of access, a feature that is normal in Minoan architecture. The residential areas are on the eastern side of the courtyard. They presented two storeys to the court, though there were

also basements taking advantage of the slope down from the courtyard and overlooking a river valley. Grand, wide staircases surrounding a light well led up and down. The individual rooms are spacious and well decorated. (Evans's attempt to assign occupiers to some of them, such as the "Queen's Megaron", are entirely fanciful.) A distinctive feature is the division of a room from a shaft by means of a set of folding doors set between piers. This must have been designed to control and modify the ventilation, to allow free circulation of air during the hot summers, to restrict it in the cooler winters. The religious function seems to have been served by at least one room on the opposite, western side of the court, one of the oldest parts of the palace: a lavishly decorated room, containing a solitary stone "throne", and with basins sunk in the floor, for water and possibly some purification ritual. The courtyard itself, it is suggested, may have been the location for the bull-jumping ritual depicted in Minoan art. The storage and workshop areas comprise long passages, with magazines and other rooms leading off. They are much vaster than would be required to meet the consumption of the residents in the palace: the materials stored and produced would be intended for trade, in a system of economy that would be managed and controlled by the centralized palace authority.

The Mycenaean palaces developed later, after the apparent collapse of Minoan Crete, and were obviously influenced by their Minoan predecessors, whose centralized political and economic systems they probably imitated. There is, however, a significant architectural difference. The central element is a rectangular hall building, divided into an open porch, with two columns, and a square room, sometimes separated from the porch by an antechamber. This was the formal area of the palace. It contained a large central hearth, too big and too magnificent to be merely for heating, and which presumably had some ritual significance. The room may have functioned as an audience chamber, or perhaps the place where the monarch consulted some form of council. It is generally assumed that it corresponds to the room where the kings of the Homeric poems carried out such functions, and the term given to it by Homer, the megaron, is normally applied to its Mycenaean predecessor. In addition, there were often subordinate rooms of similar plan, and, as on Crete, archive and storerooms for a similarly centralized administrative and economic system.

After the collapse of these complex systems, the divided Greek communities may still have been ruled by individuals; a monarchical system, dualized, survived at Sparta throughout its independence, and there were kings even in the Classical period in more backward areas, such as Epirus and Macedon. The houses of these kings may have been

somewhat bigger than ordinary dwellings, or placed in particularly prominent locations – a good example is that at Emporio on Chios – but they were of no architectural pretensions, and it would be misleading to call them palaces. Under the non-monarchical regimes of the classical cities, such buildings would only exist under tyrant administrations, but there is no archaeological evidence for the form these took (the palace at Vouni in Cyprus of the 5th-century BC seems to be non-Greek in origin).

Palace architecture becomes important again with the rise of Macedon. Traditionally the Macedonian kings resided at Aegae, but the palace found there in the 19th century dates only from the end of the 4th century BC. Before then, at the end of the 5th century BC, king Archelaus transferred his administrative centre to Pella and built a palace there. This remained the palace of Philip II, and it was there that Alexander the Great was born. It was situated at the top of an acropolis hill, overlooking the city. It is currently being excavated by the Greek Archaeological Service, but it had been very thoroughly destroyed at the end of Macedonian independence and little more than its foundations survive. Its principal feature is that it incorporates five distinct courtyards, not all built at the same time, and certainly separating official from residential areas. The residential section probably dates back to the 4th century BC. We know that important artists, such as the painter Apelles, were recruited by Archelaus to decorate and embellish it, but, inevitably, nothing of this survives.

The palace at Aegae, probably built by the successor king Cassander, who wanted to revert to the older Macedonian tradition, is better preserved. It consists of two parts, a smaller courtyard structure at the back, added at a later date, and a large formal courtyard in front, overlooking the plain of the Haliacmon river. This measures 44.50 m square, and was surrounded by Doric columns, 16 on each side and made of local limestone. The entrance is at the centre of the east side, into which it is incorporated. It is marked by two marble piers, each fronted with engaged Ionic half columns, and gives a degree of formality and axiality that is not found in ordinary Greek houses. To the left of the entrance, and entered from the court, is a circular room containing a throne, probably religious in function, dedicated to Heracles Patroos. As far as can be seen from the remains (not all are well preserved), the other rooms that surround the court were all designed for formal feasting. Those on the south side were particularly splendid, two being entered from a vestibule with marble half columns recalling those of the porch. Their floors had magnificent mosaic decoration. Those on the west had space on the surrounding plinths for 30 dining couches. Despite their dimensions, 16.74 by 17.66 m, they were roofed and tiled, with the largest unsupported

spans known in Greek architecture, an indication of the superior quality of Macedonian timberwork. The graduation of size and splendour (the floors of the largest rooms were paved with broken fragments of marble only) suggests the hierarchy of the Macedonian court. The whole concept, which was probably anticipated at Pella, was influenced by the Macedonian tradition of erecting large (100-couch) temporary dining pavilions or tents in sanctuaries for particular religious occasions. Such a pavilion was taken by Alexander on his campaign of conquest.

These Macedonian palaces must have influenced the palaces of the successor kings who established themselves in the different fragments of Alexander's empire, though little archaeological evidence survives for them. At the same time the Persian royal tradition was also influential. At Pergamum, which became the capital of an independent kingdom in the second half of the 3rd century BC, there survives on the top of the hill on which the city was built a group of houses that would have served the royal family. They have good-quality mosaic floors, but apart from their select position have nothing special about them to distinguish them from the better-quality Hellenistic houses.

More important was the palace of the Ptolemies at Alexandria. There are no surviving archaeological traces of this, though evidence for its position has been confirmed by recent underwater research in the adjoining harbour area. Literary evidence gives us some idea of its arrangement and what it comprised. The city had been founded by Alexander as a place in which he could gather the existing Greek settlers in Egypt. He may have intended a palace, though whether he would have regarded it in any sense as his capital in Egypt is unclear. Rather, the palace was developed by his successor Ptolemy I Soter (305–282 BC) and his descendants. An area by the sea and in the northeast part of the city was designated as the royal area (*Basileia*). It had two main parts. The outer, which was accessible to the public, contained sanctuaries and buildings such as the Museum with its great library, and the theatre. It seems to have been an open space of parkland – it included a zoo – within the city, with the buildings spread out. There was still room in the 1st century BC for Cleopatra to build a shrine-sanctuary dedicated to her lover, Julius Caesar. The inner area, on the promontory *Lochias* that formed the eastern side of the Grand Harbour, was occupied by the private quarters of the royal family. Even here there seems to have been open space, and the building of which we have the fullest description was a typical Macedonian dining pavilion with 100 couches, lavishly decorated and carpeted. It was built by Ptolemy II Philadelphus (282–246 BC); we have no idea if it was anything more than a temporary structure, though the description we have, by the late author Athenaeus (*fl.* AD

200), derives from the near-contemporary Callixinus, and refers to a structure then long since disappeared.

Much more remote, and part of a very different tradition, was the palace at a Greek settlement known only by its modern name of Ai Khanum in Afghanistan. Here a large area to the west of the main road through the city was devoted to the palace. It dates from the foundation of the place in the early 3rd century BC, with a final phase of about 150 BC. It was vast, covering an area of 87,500 sq m. It was entered by way of a monumental propylaea building, and then a second propylon after the road turned through 90 degrees. This led to a large courtyard surrounded with Corinthian columns, at the back of which was an oriental-type open audience hall, with a wide room behind. Behind all this was the residential area. There are distinct Mesopotamian elements in this, though it undoubtedly belonged to a Greek ruler.

The word “palace” is itself derived from the name of the Palatine Hill in Rome, where the emperors lived. At first their residences were almost entirely in the non-Hellenic tradition of the Roman atrium house. The intention was to play down the concept of monarchy, now equated with the Hellenistic rulers, but as the imperial system came more and more to incorporate elements of the Hellenistic monarchies over whose territories it now ruled, aspects of Hellenistic palace architecture were adopted by the Romans, for example in Nero’s Golden House and Domitian’s palace on the Palatine.

As a result, later palaces in the Greek area echo rather the Roman type; this can be seen in the palace of Galerius at Thessalonica with its adjacent hippodrome. The same is true of the Great Palace at Constantinople, though this has suffered badly in successive destruction and rebuilding. As with the earlier imperial palaces it comprised an official, administrative area to the east, and a residential one to the west. The entrance to the official section was at the gate called Chalke, south of Hagia Sophia. Within were audience chambers, quarters for the imperial bodyguard, a church, and a 19-couch dining hall. Terraces faced southeast, overlooking the sea, while to the northwest was the Hippodrome, corresponding in its relationship to the palace with the Circus Maximus in Rome. Little of all this remains visible, though the monuments decorating the central line of the racecourse, including the serpent column taken from Delphi, survive. Written descriptions of the sumptuous decoration within give a general idea of its magnificence; excavation has revealed mosaic floors of the highest quality.

Public Works

While domestic architecture provides shelter to individuals and families, public architecture exists primarily for the benefit of the health, safety, and wellbeing of the larger community. Public architecture caters, among other things, for the provision of water, removal of waste, facilities for personal hygiene, street paving and other civic utilities, and defensive works. Public architecture, in the form of harbours and lighthouses, roads and bridges, markets, and, more recently, railways and telecommunication systems, also facilitates and encourages commerce and other exchange. Finally, public works, such as poorhouses and hospitals, schools and orphanages, police headquarters and prisons, are associated with social welfare and public order. Depending on the historical period and on the particular administration, responsibility for the undertaking and maintenance of these projects rested variously on private individuals, the city state, the Church, the local or central administration, and national or international commercial concerns. A review of representative public works provides an insight into the daily life of an average citizen, with its attendant inconveniences and occasional luxuries, and reveals the major preoccupations and priorities of various administrations.

In the cities of Classical, 5th-century ^{BC} Greece civic buildings and public works were commissioned and financed by the citizens themselves. They included roads and fortifications, temples and theatres, stoas and gymnasia, water fountains and reservoirs. In the pre-Classical period these were financed by kings and tyrants, while in the subsequent Hellenistic and Roman eras they were often commissioned by wealthy donors and, in some cases, by the emperors themselves. Provision of water and removal of waste formed the core

of most public works projects.

Although there were elaborate bathing facilities in the palaces of Crete and Mycenae, and simple ceramic bathtubs (similar in shape to our own) in Olynthus, most people in antiquity bathed in public baths. These had separate spaces for men and women and were often located at the entrance of cities for the convenience of travellers. Public baths gained widespread popularity in Roman times, becoming large and impressive social spaces that were adorned with marble, mosaics, and statues. Public latrines, built also by the city states, similarly provided for the needs of both travellers and residents, since most houses did not have private latrines. In the Roman Agora of Athens an elegant public latrine building accommodated up to 64 customers in a generous, roughly square room. Lavatory seats, carved out of marble, were arranged around the walls. Running water continuously flushed the latrines, while an opening in the centre of the roof allowed for ventilation.

Drinking water for people and animals was supplied by wells, fountains, aqueducts, and reservoirs. In the 6th century BC the tyrant Pisistratus erected the Enneakrounos (nine-spouted) fountain in the Agora of Athens on the site of the simple spring called Kallirrhoe (fair-flowing). It became famous both for its architectural elegance and for its cool water, which was used in wedding ceremonies for the bathing of the bride. Several other fountains and wells in the Agora and the rest of the city provided water for residents and travellers, their animals and plants. In the Agora of Athens alone 400 wells were opened up throughout a 1000-year period, as indicated by pottery shards found in excavations. In Athens the supervisors of the fountains – *epimeletes krenon*, as Aristotle called them – were elected by the citizens to serve four-year terms, while less important municipal posts were assigned by lot. Care and maintenance of the water supply have always remained an utmost priority for each administration, as it directly affects the life and health of the whole population.

In the islands and other places with little rainfall, residents built private cisterns in their courtyards and occasionally public ones, like the large cistern on the island of Delos (measuring 15.5 × 6.3 m) that gathered rainwater falling in the theatre. A famous water reservoir, built in the island of Samos during the rule of tyrant Polycrates in the 6th century BC, remained in use for 1000 years. According to Herodotus, it was the work of the architect Eupalinus from Megara.

The swelling population of cities and the widespread institution of public baths increased the demand for additional water. New aqueducts transported water from the nearby mountains to central reservoirs in the cities. From there, a network of clay pipes directed the water to baths and fountains. The most elaborate fountains, called

nymphaea, were monumental in size and shape, embellished with the statue of the emperor or donor and with numerous sculptures of water nymphs, satyrs, and river gods. Among the most celebrated fountain buildings in the Greek world were the nymphaeum of Herodes Atticus in Olympia and the three-storey nymphaeum of Miletus, both dating from the 2nd century AD. The Roman emperor Hadrian, who embellished Athens with several new structures, also addressed its water supply. He built an aqueduct system that collected water from the nearby mountains of Parnes and Penteli and brought it to a great reservoir in Athens, on the southeast slope of Lycabettus. The reservoir, which can still be seen today, was cleaned up and used again in 1857 and in 1925–26. Waste water along with the rainwater of the Athenian Agora was collected in a closed conduit that led to the Eridanos river. The sewer, which survives almost intact, is still in use today.

In Archaic and Classical cities roads were usually narrow and meandering. One of the most famous roads of antiquity was the Sacred Way that started from the Sacred Gate of Athens and ended 20 km away at the temple of Demeter in Eleusis. The road was 5 m wide, defined on either side by two courses of rough stones and paved with small stones and packed earth. The road was punctuated by stone markers denoting the distance from Athens. Unlike their predecessors, Hellenistic cities were laid out with generous and regular streets. Alexandria, in Egypt, featured an orthogonal street pattern with seven parallel avenues, the central one of which was 31 m wide. Each avenue was bisected by a tree-planted island 1 m wide. One side was paved and intended for people on horses, while the other side was covered with packed earth and pebbles for carriages and chariots.

The construction of harbours was also an important undertaking in ancient Greece, since most of the commercial and military activities relied on sea routes. Harbour entrances were usually wide enough for only one ship to pass through and could be closed with a chain in case of danger. Dock buildings (*neosoikoi*) housed the boats during the winter, while the boats' movable parts – sails, anchors, ropes, chains, etc. – were stored in separate buildings called tool chests (*skeuothe kai*). *Neosoikoi* could be found in the Piraeus, Sunium, and other towns by the sea, while the most famous *skeuotheke*, that of Philon in Piraeus, took its name from the architect who designed it.

The Pharos of Alexandria, one of the seven wonders of the ancient world, was the most famous lighthouse in antiquity. It was built on a little island called Pharos for Ptolemy II of Egypt c.280 BC. It is said to have been more than 110 m high, with a light that could be seen from a distance of about 300 stadia (about 55 km) at night, while its smoke could be seen from even further away in the daytime. A broad spiral

interior ramp allowed the mules to carry wood for the fire that burned at the top. The outside of the lighthouse was made of white stone and decorated with marble and bronze designs. An inscription recorded the name of the architect, who was also known for other works he completed: “Sostratos, the son of Dexiphanos, dedicates this to the gods, saviours of those who travel.” Continuously repaired, the Pharos was still standing in the 12th century.

Defensive walls were often one of the most costly public works of a town. They usually enclosed all of a city’s area and were expanded as a city grew. Athens, for instance, built first the Mycenaean walls (1240–1220 BC) and the Pelasgic walls, followed by the Themistoclean (479/78 BC) and the post-Herulian walls of the 3rd century AD. Ruined parts of earlier buildings including stones, unbaked bricks, and tiles were commonly incorporated into the walls, which were often built in haste. In case of danger, they provided refuge not only for a town’s residents, but also for the inhabitants of the surrounding countryside.

The extensive public works established by the Romans continued to be used and maintained by the Byzantine emperors and administrators. Constantinople drew its main water supply from about 15 km northwest of the city, through an aqueduct built by Hadrian and later restored by Valens. The masonry arches which carried it a distance of 970 m still stand today. A new network of aqueducts was constructed in the late 4th century to accommodate the needs of the growing population. Additional water was supplied by large cisterns, which became the main source of water after the aqueducts fell into disuse around the 7th century. Cisterns supplied water to public baths, monasteries, and churches. The city of Constantinople, whose daily water consumption was about 10,000 cubic m, had a number of open cisterns, with approximate capacity of 900,000 cubic m, and more than 80 covered cisterns, with a capacity of 160,000 cu m. Most houses in the cities and the countryside had no plumbing. Even three-storey houses in Constantinople were often built without sewer drains. Residents obtained water from cisterns and wells and used latrines located outside the main buildings. The large public Roman latrines remained in use until about the 7th century, but apparently not beyond. Building codes regulated the construction of new latrines and other plumbing installations, such as gutters, sewers, and water pipes.

Religious

In the prehistoric period the practices of religion were partly associated with the palaces, in which rooms or areas were set aside for cult purposes. In addition, there were shrines at localities that had some particular religious significance; on mountain peaks, for instance, in Minoan Crete, or in caves. There is an obvious shrine building below the citadel at Mycenae, but its religious character is attested by its contents – terracotta cult figures and frescos – rather than the architecture, which is nondescript.

Classical religious architecture begins with the revival of the Greek world following the collapse of the Bronze Age communities and its aftermath. There is undoubtedly some continuity of religious belief, though the movements of peoples may bring different cults with them, and there may have been some association of religious practice or beliefs with the ruins of abandoned structures surviving the collapse, but by and large religion was at first devoid of monumental structures, and cults might well be performed at nothing more than an open-air altar. Yet the gods were identified as persons, and inevitably could be represented, whether or not realistically, by images. References in late literary sources (especially Pausanias) to wooden cult images of great antiquity, similar to the one that survived at Athens, suggest that these were frequent, and needed to be protected from the weather. There are a number of early, simple, square buildings at Kommos, in Crete, of the early 1st millennium BC, which probably housed such images.

From these simple origins there developed a regular system for the architectural requirements of Greek religion. The central act was the sacrifice, performed at an altar. Some altars were non-architectural (the altar of Zeus at Olympia was no more than a pile of ash), but normally they were built of stone, rectangular in shape, and decorated with the conventional architectural mouldings or other features (triglyph and metope systems, for example, in districts associated with Corinth). In the most elaborate examples, generally Hellenistic, the actual altar of sacrifice might be included in an elaborate architectural

frame, as at the temple of Athena at Priene, or, most famously, the great altar of Zeus at Pergamum. The general rule, however, was simplicity.

The sacrifices would be attended, not only by human worshippers, but by the god, in the form of the cult image, and the greatest scope for architectural embellishment was the provision of housing for the image. This is the temple, which is literally the home of the god. Its basic form is the rectangular box, a room for the image, with a porch in front. In the simplest sanctuaries, even the porch may be lacking, but very often the temple was elaborated far beyond this. The starting point was the house as a hut. Very early temples, such as that of Apollo at Eretria, were little, if at all, distinguishable from contemporary hut houses. From this point, architectural development diverges. Houses become more complex in plan, with a multiplicity of rooms arranged round a courtyard. Temples retain the simple hut plan, but embellish it, particularly externally. The original forms use simple materials, timber, wattle, mud brick, thatch, and the only durable element is often a rough footing of field stones. During the 7th century BC the development of quarrying and stone-carving techniques led to the construction of temples built of local stone, generally a form of limestone. The decorative systems become more elaborate, with recognized standard regional forms, of the column, of the entablature the columns supported, and the embellishment of the roof. These constitute the “orders” of Greek architecture, Doric in the mainland and, generally, the west, Ionic in the islands of the Aegean and the east Greek areas. Marble is used where it is locally available (the Cyclades), while the temple of Artemis at Ephesus, supported by king Croesus of Lydia, took advantage of neighbouring quarries of marble to become the first colossal building in that material. Size was a matter of prestige and cost. Temples might increase the dimensions of their basic room, the cella, but this required internal supports (the temple of Artemis at Ephesus was unroofed). Size could also be made more impressive by the addition of external colonnades. The platforms on which these stood were stepped, but as size increased it is noticeable that often, particularly with Doric temples, it was essentially a matter of scaling up the smaller buildings: where these took three steps of reasonable dimensions to give access to the platform, the larger temples retained three steps as a convention, even though as a result they became too large to be of practical use, and special provision for access, a ramp or additional steps, would be needed at the front of the building. The 7th century BC was one of great innovation, but thereafter the forms of temple architecture were essentially static, development being restricted merely to the refinement of detail. Thus in basic appearance there is no real

difference between the limestone temple of Artemis at Corcyra (Corfu), of the early 6th century BC, and the Parthenon at Athens, built between 447 and 436 BC. Both have eight-column Doric façades. The difference lies in the proportions of the columns and the Doric order in general, the proportions of the whole building, the refinement of its lines, and the quality and style of the carved decoration applied, as well as the difference of material that makes all this possible. Similarly, there would have been little significant difference between the temple of Artemis at Ephesus of the 6th century BC and its successor, built on the same foundations after the earlier building was destroyed by fire in 356 BC.

There are relatively few colossal buildings. The average important temple seems to have been about 30 m in length and less than 15 m in width. Within this width, the cella would be reduced to around 6 m wide, giving a reasonable room for the cult statue and the deposition of sacred objects, utensils, and valuable offerings, allowing individuals to admire the interior, but certainly not affording room for anything resembling a congregation. The worshippers gathered outside, and were not accommodated in buildings. Thus it was possible for many temples – probably the majority – to be much smaller, and certainly far less elaborate. The conventional view of a Greek temple as a peripteral building, that is, surrounded on its exterior with a colonnade, is misleading.

Other buildings in sanctuaries were ancillary, aimed at providing shelter for a variety of purposes. The most frequent takes the concept of the colonnade, with the orders invented for the temples, and applies them as façades for long, open-roofed porticoes, or stoas. They might provide shelter for worshippers, or for objects deposited in the sanctuary that could not go into the temple. They were useful for defining lines, and so, often, the boundaries of the sanctuary. They would not be so solidly built as temples, and thus are not so durable. Other buildings were more specialized. The core of the cult practices in most sanctuaries was the ritual consumption of the sacrificial victims, the meat being roasted and shared among the worshippers. Mostly it would be consumed al fresco – inevitably, given the thousands who would attend the major festivals – but in many sanctuaries buildings were provided to accommodate the couches on which a privileged few might recline. These often have a porch, with rooms accommodating 11 couches round their walls. Some provide more accommodation. The great banqueting building at Epidauros had six 11-couch rooms, but also two large halls each holding more than 100. Such buildings were invariably arranged round a courtyard, and this principle, adapted from the now normal form of the Greek house, could serve a variety of other purposes, particularly the

enclosed exercise ground. Other specialized buildings are found attached to sanctuaries, perhaps in an area away from the temple/altar complex, such as the open-air theatres and music buildings (odeia), and the stadium for athletic contests. Where a cult placed particular significance on performance, the theatre might well be architecturally dominant, with only an insignificant temple, as in the sanctuary of Dionysus at Athens. The entrance to the sanctuary on occasions (but not always) might be given an elaborate gateway building or propylon, two colon-naded porches placed in front and behind a wall with the actual door openings. The coherence of all these structures within the sanctuary would normally depend on the repetitive use of the architectural order; though use of the orders soon spread outside the sanctuaries, they originated specifically in the religions context.

Some sanctuaries might require special buildings. Major sanctuaries, like Olympia or Delphi, which were international in character, were often given buildings as offerings by individual cities to the presiding deity; these “treasuries” generally took the form of miniature temples. Others had particular cult requirements, the most important being those cults where the ritual involved the performance of secret procedures seen only by people who had been initiated into the cult. Foremost was the cult of Demeter and Kore at Eleusis, where a large enclosed and roofed building was put tip (following earlier and smaller structures) in the 5th century BC; eventually, this too was given a colonnaded porch.

Such sanctuaries continued to be built and used during the Roman period; the Roman form of temple was similar, but generally stood on an elevated podium, approached only from one end. There are surprisingly few specifically Roman-form (as opposed to chronologically Roman) temples in the Greek world, except at places such as Corinth, which had now become actual Roman colonies. Generally, Greek religion remained loyal to the Greek type of temple.

The acceptance by the Greek world of Christianity brought about a profound change. The new religion was both initiatory and congregational; it required closed buildings in which the ritual could be performed, but large enough to accommodate the congregation. The model for this therefore was not the pagan sanctuary with its outdoor altar and sacrifices, but the Roman basilica, a building form that had developed in the 2nd century BC, almost certainly from Hellenistic royal origins (hence its name), but used by the Romans essentially for secular purposes: legal actions, political gatherings, commercial transactions. It would normally be one of the buildings attached to the forum of a Roman city, and comprised a rectangular hall with a platform for a presiding magistrate or judge, usually at one

end, and formed by an apse projecting from the main hall. To support the roof, it was divided along its length by two rows of columns supporting a clerestory, with the roof itself carried on wooden beams. Because of developments in Roman woodworking technique it was now possible for the central nave to be reasonably wide; together with the aisles to either side it could hold a congregation easily. In secular Roman architecture the form of the building remains conservative for most of its history. The columns bear a horizontal architrave, and the roof supports remain wooden.

Such a building required virtually no modification to serve as a church. The apsidal tribunal, filled with semicircular tiers of seats, accommodated the priests. Privacy was maintained during services by the construction of a closed porch across the front of the building, the narthex, to which the catechumens, those seeking to become members of the church, would be admitted and from which they could glimpse the proceedings. Outside this, and in major examples, an enclosed colon-naded court provided additional privacy. Such Christian basilicas were built at Rome (Old St Peter's, San Paolo fuori le Mura) and at Constantinople, as well as in the older Greek cities. There was a particularly large and splendid basilical church at Lechaion, the harbour town of Corinth.

An alternative form of church developed in the Greek areas. It seems to have originated with a special type of building devised to embellish burial places, particularly of people designated saints; a most important example was the church covering the Holy Sepulchre in Jerusalem. For this an alternative Roman form of construction, the dome, was adopted. In the first instance it came over circular buildings, and is obviously related to a whole range of Roman secular structures. At the same time, there were large roofed halls in other structures, where the roofs were not supported by wooden beams, but formed by concrete vaults, particularly the great cross-vaulted cold rooms, the frigidaria, of Roman imperial bath buildings. One secular basilica, that of Maxentius and Constantine at Rome, had already employed this system in a freestanding building. The new development was to combine the domed structure with the vaulted hall, using the device of pendentives to transfer the circle of the dome to a square of massive piers linked by arches. In front of this, the nave and aisles would be vaulted over piers linked by arcades; behind, the projecting apse, as in colonnaded basilicas, was covered with a semidome. Subsidiary domes might replace the vaults in the body of the church. Such construction culminates in the great churches of St John at Ephesus, and Hagia Sophia at Constantinople. Although there is no hard and fast rule, later churches in the Greek cast tend to the domed form, those in the west the basilical. Thus it was the Orthodox

domed church that influenced the Islamic architecture of the Ottoman empire, while in the west the basilica led to the medieval cathedral.

Archives

Archives, in the modern sense of the term, were slow to appear in ancient Greece and even then never really corresponded to their modern counterparts in form or function. Oral tradition remained paramount at least until the 5th century BC. Written documents were not necessarily viewed as authoritative or considered important in and of themselves until relatively late in the Classical era. While the Mycenaeans certainly created written records, as witnessed by the many surviving tablets in Linear B, little can be said about their retention and organization. Record-keeping remained sporadic and unsystematic throughout the Archaic period. Cities often recorded important public documents, such as laws, lists of officials, and treaties, on stone. These inscriptions might be found in a variety of locations and in no way constituted a single collection of public records, although groupings of inscriptions are sometimes referred to as archives. Both individuals and cities often used temples as repositories for documents; Heraclitus, for example, allegedly deposited a copy of his writings in a temple of Artemis. Records not deemed worthy of stone were consigned to less durable media, such as wooden tablets (*pinakes*), whitened boards (*leukomata*), and papyrus.

Athens instituted a central archive, the Metroon, in the late 5th century BC (probably between 409 and 405 BC). This was placed in the old council house (Bouleuterion), when a new council house was built on an adjacent site. The building served as a shrine to Demeter as well as the archive, hence the name Metroon. The archives were under the jurisdiction of the Council (Boule) and were staffed by public slaves. It is likely that the contents originally consisted largely of council documents: decrees, correspondence, treaties, etc. As in the past, the

keeping of administrative records usually remained in the hands of the individual officials. Many of these officials failed to keep records or treated them as temporary mnemonic devices to be destroyed once their purpose was served. Later in the 4th century BC other documents, such as laws, came to be placed in the central archives. Individuals began depositing personal documents in the public archives at some point in the late 4th century BC. Epicurus deposited his will (Diogenes Laertius, 10. 16) and probably copies of many of his writings in the Metroon.

By the later 4th century BC the use of written documents was increasing. Greek cities of the 4th century BC and Hellenistic period usually had an archive or record office. These served as depositories for the original copies of public records, usually on papyrus or parchment. Private documents, such as contracts and wills, were also frequently deposited in city archives (Aristotle, *Politics*, 1321b). Important public documents might be inscribed on stone in a public place as well; these have sometimes survived. The contents of these “stone archives” tended to be selective and focused on a particular theme. The documents often concerned the rights and privileges of the city. At Priene a small archive on stone preserved decrees and letters of Alexander the Great and Lysimachus that apparently granted various rights to the Prienians. Similarly at Aphrodisias a number of inscriptions document relations between the city and Rome from the late Republic to the time of Septimius Severus with the aim of establishing grants of autonomy and immunity to the city by Rome. Local cults and festivals also figure prominently in Hellenistic inscriptional archives. An example is an archive from the agora of Magnesia-on-Maeander, which concerns the Panhellenic festival of Artemis Leukophyrene.

The best-known and most developed Greek archives are those found in Ptolemaic and Roman Egypt. These tended to be more elaborate than those found elsewhere in the Greek world, reflecting the highly bureaucratic nature of Egyptian society. In addition to the central archive in Alexandria, each district (*nome*) had its own archive, which kept records of many private transactions as well as official ones. Many larger villages had their own record offices (*grapheia*) which kept local records and sent copies or summaries of these to the *nome* archives. The workings of the *grapheion* in the village of Tebtunis during the 1st century AD are particularly well understood thanks to the many surviving documents. In the Roman period the *nome* archives also sent summary records to the central archive in Alexandria. Many private archives of Graeco-Roman Egypt also survive in part. While some of these represent accidental groupings of related papers, others indeed represent conscious record keeping by

individuals or families. Some of the better known archives of this type include those of Zenon (3rd century BC), Nemesion (1st century AD), Heroninus (3rd century AD), Aurelius Isidorus (4th century AD), Abinnaeus (4th century AD), and Dioscouros of Aphroditos (6th century AD).

Argolid

Region in southern Greece

The Argolid is most simply defined as the territory of Argos when it was a city state, but simple definitions are never complete. Argos came to control the entire plain which it dominates geographically from the west, but beyond that there are other areas which in a broad sense constitute part of the Argolid, but which were not part of Argos. Often the term Argolid is taken to include the whole of the area between the Saronic Gulf to the north and the Gulf of Argos to the south, but it is best restricted to the plain and its surrounding mountains, for within the wider area the plain of Argos is distinct from the mountainous and more broken region to the east. All the important communities are positioned in or around the plain; of those beyond, Epidaurus, though claimed by Argos, was rarely under Argive control, while the more distant cities of Troezen and Hermione were always completely separate entities. It is the Argive plain that matters.

Along the plain's southern edge is an extensive sweep of beach; though the ancient coastline was inland from this, it must have been similar. The plain extends northwards to form a roughly triangular area. Argos is almost at the southwestern corner; at the southeastern corner is Nauplia (modern Navplion), and, a little to the west, Tiryns. Mycenae is, more or less, at the northern apex. Today the best harbour and most important town are at Navplion. In antiquity Tiryns probably had little more than an open beach and probably used Nauplia's harbour. Argos is further away from the sea, but evidence for overseas trade is clear for the Archaic period, and some form of maritime outlet is certain.

Otherwise communication and access are by land. Until recently the main route, followed by road and railway alike, entered the plain from the north, from the territory of Corinth and its neighbour Phlius down past Mycenae. It left Argos heading south, where, near Lerna, the mountains come closer to the sea; it then went across a smaller plain, into the hills that took it up to Arcadia, the centre of the Peloponnese, or along the coast into yet another plain, the Thyreatis, the possession of which was long disputed between Argos and Sparta. The Argive plain was therefore of some strategic significance, coming between the central and southern Peloponnese and the north, but it was not as strategic as Corinth, which could block the passage from south to north absolutely. There were alternative routes past the Argive plain through the hills and mountains to the west, from Arcadia, past Tegea and Mantinea, across to Phlius, and down to Sicyon and the gulf of Corinth. The modern motorway follows part of

this route past Mantinea and over to Phlious, although this is only achieved with the help of a substantial tunnel. Nevertheless, the pass over the mountains at this point was always feasible, and this was the route preferred by the Spartan armies.

The Argive plain is potentially fertile. Though no great river flows through it, the surrounding limestone hills retain the water, and there are abundant springs round its edge. It is here that the communities grew up, and there is much evidence for settlement already in the Neolithic period. By the Early Bronze Age there were important communities around the plain, especially on the site of Argos itself, but the period of greatest significance was undoubtedly the Late Bronze Age, generally termed the Mycenaean Age to give emphasis to the apparent predominance of that state. This is based partly on archaeological evidence, and partly on an interpretation of the Homeric poems, which give supreme authority to Agamemnon, king of Mycenae, over an alliance of the whole of mainland Greece. How far this reflected political reality is impossible to say, but in so far as there is evidence of a common standard of material existence and wealth in mainland Greece, the importance of Mycenae is certain, though it is an importance shared with the other communities of the Argolid.

How this wealth was acquired is unclear. Today the plain produces a mixture of crops, including citrus fruit, but in antiquity much of it was probably used for corn. Horse-rearing also seems to have been significant, particularly in the Late Bronze Age, and remains of horses have been found deliberately buried, presumably with their owners, in Late Bronze Age graves. Homer often mentions horse rearing and describes Mycenae specifically as “rich in gold”, though this would have come from elsewhere. Mycenae, with its heavily fortified citadel, is often compared to a robbers’ lair, but this is over-dramatizing the situation: the fortifications are repeated at Tiryns and elsewhere in this period, and are essentially defensive. Control of the sea may have involved overseas raiding – the genesis of the story of the siege of Troy may lie in a memory of such activity – but trade and exchange, however it was conducted, is the likeliest explanation for the Argolid’s wealth.

Argos seems to have been less important in the Late Bronze Age than in the succeeding Classical period, and this can lead to some confusion, since Athenians in the 5th century BC were liable to attribute the Homeric stories to the kings of Argos rather than Mycenae, which by the 5th century BC barely existed. More significant is the existence of a whole string of communities along the eastern side of the Argive plain, starting with Mycenae in the north. Not all their ancient names are known. Next to Mycenae is the locality known

as the Argive Heraion, where the most important of the Classical sanctuaries developed. Graves indicate that there was a prehistoric settlement here. A short, dry gorge leads northeast to the small plain of Berbati, with hills all round except at the point of entry: again, a place of Late Bronze Age settlement. Further south are Dendra, with important graves, and Midea, with its long fortification wall leading to a remote hilltop site. Finally, at the southern end of this string of communities is Tiryns.

There is a pattern to these places. There is a reasonable degree of separation between them, so that they could function independently. They are all situated at springs, or where springs once existed, another clue to their existence. Whether they actually were independent, or whether they were all placed under the control of one authority, is not known. Mycenae and Tiryns were both equipped with structures suitable for a ruler and his needs. Their fortifications were very extensive, with spectacular and well-defended entrances. Inside the fortifications of both places was a rectangular building, with a porch at one end and a ceremonial hearth within. These buildings have been identified as palaces and would seem to have been where rulers could perform their official duties. Both buildings have storage space and have yielded evidence of imported goods from overseas. Mycenae, more than Tiryns, has massive cemeteries with different types of graves. The earlier shaft graves, which were excavated in the 19th century by Heinrich Schliemann, contained the fabulous gold treasures and other objects now in the National Museum at Athens. The later graves include the tremendous tholos tombs with their high corbel-domed chambers which, though mostly robbed centuries ago, still impress with their structural competence and scale. More ordinary graves, particularly rockcut chamber tombs, which are related in form to the tholoi, have been found at all the Late Bronze Age sites. Although these tombs probably belonged to people of lesser rank, they often contained offerings of value. Taking all this into account, and comparing it with other regions of Greece of the same period, it is clear that in the Late Bronze Age the Argolid was the wealthiest and the most important area of mainland Greece, and that it had taken over from the earlier supremacy of Minoan Knossos in Crete.

In the 11th century BC all this collapsed, despite the construction of massive fortifications in the principal centres. What eventually emerged in the 8th century BC was rather different. Some of the Late Bronze Age centres continued as communities, such as Mycenae, Tiryns, and Asine, near Nauplia. They may, like Mycenae, have patched up their stupendous fortifications. Mycenae's connection with the heroes of the Homeric poems was accepted, and the hero worship

of Agamemnon was established in the greatest of the tholoi, which was identified as his tomb (or, alternatively, as the treasure chamber of his father, Atreus). Tiryns also continued to be inhabited, but, like Mycenae, seems to have had a much-reduced population. According to Herodotus, at the time of the Persian invasions in the early 5th century Mycenae and Tiryns, unlike Argos, sided with the anti-Persian alliance and between them could only field an army of 400 men. The Argive Heraion was now a sanctuary, rather than a settlement. The lead undoubtedly had passed to Argos. Behind this development lies the arrival, into a depopulated region, of Dorian settlers who established themselves at Argos rather than the eastern sites, which perhaps overawed them with their massive remains. At Argos they settled on the lower ground below the citadel, just as at Sparta they chose a new, low-lying site across the river from the Bronze Age settlement. The eastern Argolid communities may have continued to be descended from the earlier population. The Argive Heraion, to judge from the objects deposited in it, at first belonged to its eastern geographical neighbours.

In the 7th and 6th centuries BC this changed as Argos took political control of the entire area. The Heraion now became the principal sanctuary for the whole of the Argolid. It was this that made Argos one of the major cities of Classical Greece, though its control was briefly broken as a consequence of the Battle of Sepeia in about 494 BC when it was defeated by Sparta, and Mycenae and Tiryns regained their independence. It was not long, however, before Argos recovered and reunited the Argolid under its control. But the Argolid never regained the preeminence it had enjoyed in the Late Bronze Age. The overseas trade, and the benefits of that trade, moved from the gulf of Argos to the Saronic gulf and Athens. All this is reflected at the Argive Heraion. The sanctuary is an important one. It contains the remains of one of the earliest peripteral temples in Greece which, although its columns were of wood, is likely to have been a forerunner of the Doric order. Destroyed by fire in 416 BC, it was replaced with a more up-to-date stone temple. Little of this replacement remains, apart from its foundations, but the sculpture, including the cult statue, was attributed to the greatest of the Argive sculptors, Polyclitus. Even so, and although in its design it shows Athenian influence, this temple nowhere approaches the Athenian buildings in quality or magnificence.

The later history of the Argolid is relatively uneventful, and is essentially that of the city of Argos. During the Roman empire the Argolid continued as a prosperous backwater, with most of the population probably living in the city. There is a Roman bath building at the Argive Heraion, which was excavated in the early 20th century,

and which has partly eroded away. Otherwise there is little Roman construction outside the city. There are some good examples of late mosaic floors, now in the Argos museum, which indicate continued prosperity into the 5th century AD. Later still, scattered over the Argolid, and often incorporating the remains of Classical buildings, are a number of delightful but small Byzantine churches which suggest a population living in villages, most noticeably on the eastern side of the plain, and continuing a traditional pattern of life.

Argos

City in southern Greece

The city of Argos has a continuous history from the Neolithic period to the present day. It centres on two hills, the high acropolis, called the Larisa, to the south, and the lower, rounder Aspis to the north. The main area of settlement is on the eastern side of these two hills. Of the earliest occupation only traces remain, but of the Middle Bronze Age there is more substantial evidence, particularly on the Aspis. By the Late Bronze Age the hills were fortified. They look across the plain towards Tiryns, on the coast, and Mycenae, further inland. The relationship between the three communities during this period is imprecisely known; Argos may have been the least significant of the three, and as such perhaps the least likely to survive during their decline at the end of the Late Bronze Age. Whatever the reason, it was occupied by new settlers, of Dorian origin, who seem to have assimilated the descendants of the original population. By the 8th century BC Argos was again a flourishing city and a leading community in the Greek world as it emerged from the obscurity that followed the collapse of the Late Bronze Age states. It produced an abundant sequence of pottery decorated in the Geometric style, less refined than that of Athens, but equally vigorous. Much survives from local burials, indicating a degree of prosperity in the community. Even more significant is the suit of bronze armour – comprising a helmet, breastplate, and shield – that was found in one of the graves at Argos,

named the "Panoply Grave" after this discovery. The bronze from which this armour was fashioned would have been imported, a sign of revival at Argos, and it probably indicates the first stages in the development of the form of warfare which led to the heavily armoured infantryman, the hoplite, of Classical history.

There is a tradition that at this time Argos controlled a wide area of the Peloponnese, but this was still a long time before true historical record began, and it may be an anachronism, either a reflection of the larger territorial states of the Late Bronze Age or the predominance of another city, Sparta, in the Classical period. It is unlikely that in the 8th century BC Argos controlled even the eastern side of the Argive plain.

During the 7th century BC Argos underwent changes. The city's pottery industry seems to have collapsed, or, at least, ceased producing vases to be deposited in graves. Political resurgence brought a certain Pheidon to power. He is described by Aristotle as a king (meaning, perhaps, that he exercised traditional religious and military power) who became an authoritarian ruler (a tyrant, in the Greek sense) seizing control of the Olympic Games on the other side of the Peloponnese and engaging in war with the Spartans as well as with more closely neighbouring cities. He is also said to have introduced a standard of coinage, an anachronism for the 7th century BC and possibly again a misinterpretation. Whatever the truth of all this, Argos was by that time clearly becoming a major city, powerful enough to challenge Spartan supremacy in the Peloponnese, though not to prevail. At the battle of Sepeia (494 BC) the Argive army was crushed by the Spartans, and Argos forced into a submissive peace. Subsequently Argos was invited by Athens and Sparta to join their resistance to Persia, but Argos tactfully set impossible conditions, so justifying its refusal and doubtless hoping to play the Persians against the Spartans. When the peace between Argos and Sparta expired after 30 years, the Argives, this time in alliance with the Athenians, challenged the Spartans but again were crushed. Nevertheless the city flourished. On the lower ground below the Larisa the agora was developed at this time, its edges being delimited in part at least by extended porticoes (stoas) of a thoroughly up-to-date form. A further attempt at victory over the Spartans, again in alliance with the Athenians, ended in defeat for the Argives at the Battle of Mantinea in 416 BC. In the years that followed Argos rallied support from other Peloponnesian cities who had turned against Spartan authoritarianism. This led to the so-called Corinthian War, during which an interesting political experiment, a union between Argos and Corinth, gave much alarm to the Spartans, who duly suppressed it.

A revival in the city's fortune came about fortuitously when the

Macedonian kings, whose family name was Argeadae, claimed descent from the legendary kings of Argos, apparently on the dubious basis of the similarity of name and the invention of a fictitious genealogy. This meant, after the Macedonian victory of Chaeronea, that the Argives were in favour. Even after the death of Alexander the Great and the confusion which followed, Argos remained loyal to its Macedonian connection, and eventually to Antigonos Gonatas who ruled Macedon for much of the first half of the 3rd century BC. His enemy Pyrrhus tried to take Argos by surprise, but lost the initiative when one of his battle elephants (previously used spectacularly in his fruitless war with the Romans) got stuck under a city gate. Pyrrhus himself broke into the town, only to meet an ignominious death when an old woman dropped a heavy rooftile on his head. For much of the 3rd century BC Argos was ruled by pro-Macedonian tyrants, who were derided for their subservience by Greeks opposed to Macedonian supremacy, but who were perfectly acceptable to the citizens of Argos, who prospered as a result.

The major contribution of Argos to the Classical tradition in the arts lay undoubtedly in the field of sculpture. The early Argives' skills in bronze working produced in the 7th century BC a series of decorated shields, primarily for dedication in the sanctuary at Olympia and probably reflecting the Argive involvement there. With the development of the lost-wax technique of hollow casting, these bronze-working skills were later applied to freestanding sculpture. The pioneer in this, Ageladas, is no more than a name. He is eclipsed by the 5th-century sculptor Polyclitus, perhaps a pupil, though the chronology is uncertain. Only copies of Polyclitus' works survive. One in particular, called the *Doryphoros* (spear-bearer), seems to have been produced as the sculptor's ideal of masculine human beauty. The form, as well as the style, influenced sculptors of the succeeding century, and in the Roman period Polyclitus was regarded as the supreme exponent of his art, so that Polyclitan forms are used, for instance, for portrait statues of the Roman emperors, such as the *Prima Porta Augustus*; others, incongruously, go even further and depict emperors in Polyclitan nudity.

Aristarchus of Samothrace c.215–c.143^{BC}

Librarian and scholar

Aristarchus was born in Samothrace c.215^{BC} and died at the age of 72 (we are told) c.143^{BC} in Cyprus. Most of his adult life, however, was spent in Alexandria, first as tutor to several young royals of the house of Ptolemy and then as one of a distinguished line of librarians at the most famous centre of learning in the Greek world, the Museum. His predecessors were Zenodotus, Apollonius of Rhodes, Eratosthenes, and Aristophanes. Although nowadays we tend to think of librarians primarily as cataloguers and maintainers of the texts in their collections, those at Alexandria were also scholars and occasionally, most notably in the cases of Apollonius and Eratosthenes, poets as well. (Callimachus, however, the most famous of Hellenistic poets and the compiler of the *Pinakes*, a list of authors and their works so complete that it could serve as library catalogue, never served as a librarian.)

Aristarchus has his detractors as well as fans, but despite the frequent difficulty in distinguishing his contribution from the vast amount of scholiastic material in the margin of extant Greek texts, especially the scholia of Homer, the overall nature of his contributions is clear. Like his predecessors, and much like any modern editor and commentator, Aristarchus was responsible for establishing the standard text and explaining his choice of readings and the meanings of puzzling words, expressions, character motivation, and overall meaning. Prose works, arriving in the library in fewer copies with fewer textual variants, required (or at any rate received) little work of this sort, although Aristarchus did write a commentary on Herodotus, some traces of which survive. Poetry, however, written in all the dialects ever spoken in Greece, to say nothing of the artificial forms that Homer and others felt free to create, and showing up – “published” is too narrow a term – in varying lengths for the same work and with a variety of lexical and morphological forms, required a battery of methodological skills. Homer and Hesiod, therefore, along with the more difficult lyric (notably Alcman and Pindar) and tragic poets, received the greatest attention from the Alexandrian poet-scholars.

The first task, as suggested above, was to establish a standard text, which in large part was derived from what was thought to be the best readings of preexisting manuscripts; but to a lesser extent, when the manuscripts were deemed unsatisfactory, editorial intervention was brought to bear. The gentlest instance of the latter was the use of

marginal signs designed to alert the reader to questionable lines, which would be allowed to stand in the text. Aristarchus, for example, kept many lines which Zenodotus had expunged from his official text of Homer. A stronger measure would excise one or more lines or alter individual words.

Of all the poets treated by Aristarchus – Homer, Hesiod, Archilochus, Alcaeus, Pindar, Aeschylus, Sophocles, Euripides (very likely), and the comic poet Aristophanes – it is the author of the *Iliad* and *Odyssey*, thanks to the vast amount of carefully attributed scholia surviving in medieval manuscripts, who provides us with the best picture of Aristarchus' activities as both editor and commentator. In hundreds of places the scholia on Homer name Aristarchus as their source; in others a suggestion that is anonymous in the scholia is attributed to Aristarchus elsewhere, which strongly suggests that many other anonymous scholia owe their origin to him. We even on occasion learn his earlier views along with his later thoughts, as expressed in his second commentary on Homer. Some of the characteristics of Aristarchan scholarship are:

(1) Removing narrative inconsistencies. For example, to avoid inconsistency between Odysseus' account to Alcinous in book 7 of the *Odyssey* and Homer's narrative of the same event in book 6, Aristarchus altered a sunset in the earlier book to late afternoon, although, even if this was an inconsistency, rather than the result of yet one more bending of the truth on Odysseus' part, it would be Homer's and not that of a scribe; it would deserve not textual emendation so much as notice (with or without censure). In fact Aristarchus himself did this on other occasions in his separately published commentaries, as when he pointed out, without demanding alteration or excision, that the emissaries to Achilles in *Iliad* 9 ate two dinners on the same day (as what soldier could not?).

(2) Excising "improper" passages. Homer had been criticized for describing gods impiously as early as Xenophanes and most notably by Plato, but although the editorial vice of actually removing such passages is associated chiefly with Zenodotus, Aristarchus too is guilty of this. It is, for example, only thanks to Plutarch that we know the lines spoken by Phoenix in *Iliad* 9, where he says that he considered killing his own father, which were ejected from the text by Aristarchus and from all subsequent copies. But these lines are part of a long speech in which Phoenix artfully develops a parallel between his younger self and Achilles, who had threatened *his* superior, Agamemnon.

(3) "Explaining Homer from Homer". The idea behind this well-known phrase is an excellent starting point for any commentator, but Aristarchus could carry it too far, occasionally misinterpreting a

Homeric word, when even a text so close in time to Homer as an early Homeric hymn would explain and defend Homer's usage. Since excesses of this sort were largely limited to his commentaries, they did not affect the text. Some close readings of the text, moreover, such as Aristarchus' attempts to understand the point of individual similes, can still stand.

Many of Aristarchus' readings were adopted by later editors and still appear in current editions. More important than any tabulation of his presence in later texts, however, is the example that he and his fellow Alexandrian editors left for their successors. For all that their methodology has been tempered with a greater understanding of Greek historical linguistics and the nature of poetry, their diligence and desire to explain all puzzling passages on rational principles remain the core of modern editorial practice. Their philology is our philology.

Biography

Born in Samothrace c.215 BC, Aristarchus spent most of his career at Alexandria. He was tutor to the Egyptian royal family. He succeeded Apollonius as head librarian of the Museum and was also a scholar and critic. He produced critical editions of Homer, Hesiod, Archilochus, Alcaeus, Anacreon, and Pindar. He wrote commentaries on Homer, Hesiod, Archilochus, Alcman, Pindar, Aeschylus, Sophocles, Aristophanes, Herodotus, and perhaps Euripides. He died in Cyprus c.143 BC.

Aristides, Aelius AD 117–c.180

Writer and orator

In many respects Aristides is a typical representative of the cultural tendencies of his age, the so-called Second Sophistic, while in others he cuts a rather peculiar figure. Born into a well-to-do family of the little town of Hadriani in Mysia, he acquired a thorough rhetorical education based on the great texts of the Greek classics and soon began to pursue the career of a professional speaker (a “sophist” in the

parlance of the time) for the multifarious public occasions that the cultural life of his times provided. A long-lasting illness, however, with symptoms of physical as well as psychic distress, which broke out soon after he had returned from an educational journey to Egypt, forced him to curtail public appearances and to spend long periods within the precinct of the healing god Asclepius at Pergamum. Aristides himself documented these periods in his *Hieroi Logoi* (Sacred Discourses), relating how the god appeared in his dreams and gave him various (and sometimes quite strange) commands to fulfil, but also encouraged him to carry on with his rhetorical studies, promising that he might even surpass the great Demosthenes. The *Hieroi Logoi* thus reveal not only the workings of an overanxious and selfcentred mind, but also a singular determination to rival and outdo the best of the Classical authors he had been taught to emulate.

It was apparently in the AD 150s that Aristides was able to put his illness behind him and publicly perform some of his great speeches, among them the famous *Encomium to Rome*; in this he celebrated (not without some exaggeration) the civilizing power of the Roman empire that had given the Mediterranean and especially the Greek world a stable frame within which to survive and prosper (Aristides was a Roman citizen, a distinction probably inherited from his father). Like other Greek intellectuals of his time, however, he looked back even more to the glorious days of Classical Greece and wrote an even longer speech (the *Panathenaikos*, its title not fortuitously evoking its great predecessor written by Isocrates) extolling the cultural and political achievements of Athens in its most illustrious days. In a similar vein, his *Meletai* ("declamations", i.e. speeches conceived as if pronounced by some great historical figure in a certain historical situation) tried to bring back to life some of the most decisive moments of Classical history (e.g. the situation on the eve of the Battle of Leuctra in 371 BC; the Athenians deliberating about reinforcements to their troops fighting against Syracuse in 414 BC); and a number of hymns in prose – a genre of which Aristides even claimed to be the inventor – praised the gods of Classical religion. Still, at least some part of his rhetorical activity was also directed to the present. Like Dio Chrysostom, he addressed various cities and exhorted them to put aside their internal differences and rivalries with each other. His most remarkable achievement in this domain is the speeches on Smyrna, which he addressed to the Roman emperors Marcus Aurelius and Commodus after the city had been levelled by a disastrous earthquake in AD 177 or 178; these speeches actually moved the Roman authorities to contribute decisively to Smyrna's resurrection.

Some of Aristides' most elaborate works were probably never performed, but were disseminated in written form and soon proved to

be influential. In three long essays he intervened in an intellectual struggle of already long standing, that between rhetoric and philosophy, both of which claimed to be the most important subject of a higher education. Since Plato had carried out his formidable attacks on rhetoric in the *Gorgias*, that struggle had never ceased, and now Aristides came down emphatically on the side of rhetoric. A long double essay *On Rhetoric* proclaimed the pre-eminent worth of its subject against philosophy, and the equally long *In Defence of the Four* aimed to rehabilitate the achievements of the four great Athenian statesmen and generals Miltiades, Themistocles, Cimon, and Pericles, which had been ferociously taken apart in the *Gorgias*. Later on, the Neoplatonists took these attacks on their founding father seriously enough to react to them: in the latter part of the 3rd century ^{AD} Porphyry wrote *Against Aristides* in seven books, and in the 5th century Olympiodorus and Proclus still felt obliged to take note of Aristides' essays.

It was, however, in the field of rhetoric itself that Aristides proved most influential. He was one of the foremost exponents of literary Atticism in his age, and his efforts to make his style conform as much as possible to the way Attic authors had expressed themselves some 500 years earlier were astonishingly successful. He had no gift for extemporizing speeches (an ability that was very much sought after in his time), but rather preferred to polish his texts as meticulously as possible in his study. This may in fact have assured their survival; Aristides is one of the very few typical authors of the Second Sophistic whose work was preserved beyond the end of antiquity, and he even belongs to the small number of Greek writers whose works survive almost in their entirety. For centuries after his death (which probably occurred around ^{AD} 180) Aristides very nearly attained the goal he had so fervently pursued: to surpass Demosthenes. Already in the 3rd century ^{AD} the rhetorician Longinus regarded him as the defender of Atticism against the dissoluteness of so-called Asianic oratory (characterized by bombast and emotion); at about the same time the rhetorical treatises of Menander of Laodicea (who also wrote the first commentary on him) cite Aristides as often as Isocrates and Plato and considerably more frequently than Demosthenes and Lysias. In the 4th century ^{AD} Libanius and Himerius show his influence: Libanius wrote set pieces against declamations that Aristides had worked out (e.g. his *Embassy Speech to Achilles*) and the *Hieroi Logoi* provided inspiration for his autobiography, while Himerius' *Polemarchikos* drew on Aristides' *Panathenaikos*. At about the same time Sopater of Apamea provided an *Introduction* to Aristides' work and commentaries, which – together with the exegetical notes of other authors – later became a part of the extensive scholia (explanatory notes) that were added in

the margins of the manuscripts.

After the dark centuries of early Byzantium we find Aristides holding an important place in higher education. Photios in his *Bibliotheca* (cod. 246–48) provided excerpts of the *Panathenaikos* and the long anti-Platonic speeches on rhetoric; in the 10th century archbishop Arethas ordered the writing of what today is the most important Aristides manuscript (A, Oxford, Bodleian Library, MS E.D. Clarke 39) and added notes to it. In the 11th century Theodora (daughter of the emperor Constantine VIII and later an empress herself) copied a text of Aristides in her own hand, and Michael Psellos commended studying him – besides such classics as Demosthenes, Isocrates, and others – as a necessary means for attaining mastery of style. The Palaiologan renaissance preserved Aristides' influence; two speeches *On Exemption from Public Burdens* (also called the “Leptinean orations”) by Thomas Magistros (who also excerpted Aristides for his lexicon) even found their way into the Aristidean corpus. In the 14th century Theodore Metochites not only modelled his *Byzantios* on Aristides' encomium on Rome, but also wrote an essay comparing Aristides and Demosthenes, and in the 15th century the *Hieroi Logoi* still provided inspiration for John Chortasmenos's reports on his own sickness. The fall of Byzantium finally put an end to Aristides' long importance as a model for elaborate rhetorical writing.

HEINZ-GÜNTHER NESSELRATH

Biography

Born in AD 117 at Hadriani in Mysia, Aristides was educated in Athens and Pergamum and travelled widely (to Egypt, Cyzicus, and Rome) before settling at Smyrna. Chronic illness forced his (temporary) retirement and enabled him to pursue his rhetorical studies. He became a great exponent of literary Atticism for which he was much admired by posterity. He died c.180.

Aristocracy

Rule by the “best”

Aristocracy (*aristokratia*), a form of government based on the principle that the “best” should rule, is a compound of the Greek words for the best (*ariston*) and rule (*kratos*). Aristocracy may appear similar to rule by the rich (plutocracy), or by the few (oligarchy), or by honour (timocracy), but it is distinguished by the exercise of power by a hereditary minority, usually a relatively small landed class. Aristocrats claim to be the best because they are the possessors of some superiority by blood, lineage, rank, talent, virtue, or wisdom, which becomes a legitimizing principle. A variety of socio-political practices and political arguments have been used to justify the resulting privileges. Aristocracies develop traditions to set themselves apart from the common mass of people. By adopting distinctive styles of behaviour, dress, habits, speech, interests, education, and even sexual practices, aristocrats are marked as qualitatively different from ordinary people. These cultural distinctions are inculcated into all members of the aristocratic families. Aristocrats seek to maintain themselves by the principle of purity of blood so that only a noble may marry a noble. They usually maintain control of the principal sources of wealth, military training, and the institutions of religion. By means of these controls power can be held for generations. Aristocracies degenerate in several ways. Excessive inbreeding can eliminate the vigour needed to rule. Inter-marriage with the *nouveaux riches*, or with powerful oligarchs, to renew ebbing fortunes violates the genetic principle and puts the aristocracy up for sale. Or they may simply fail to cope with changing times.

In Homer “the best” usually means the best warriors. By the Archaic period the Homeric military elite of merit had changed to a nobility of birth. When combined with the advantages that family traditions and

wealth provide, aristocracy can produce those who are the apparent “natural leaders” of society, Greek aristocratic families claimed that descent from a heroic or mythical person set them apart from and above others in every generation. The aristocrats were the eupatrids, or those born to “good fathers”.

In the 8th century ^{BC} when the Greek city states were emerging from the Dark Ages, the kings of earlier times had all but vanished, except at a few places such as Argos and Sparta. Elsewhere kings were replaced by or dominated by aristocrats. For the next few centuries the aristocrats ruled or dominated their respective city states, usually through a council (*boule*). Often the ruling class came from only one clan.

By the end of the 6th century ^{BC} socioeconomic and military changes brought challenges to aristocratic power. Growing population pressures and economic difficulties impoverished small farmers. Lenders, often aristocrats, sold indebted fellow citizens into slavery. These conditions and practices led to socioeconomic tensions which were aggravated by the revolutionary changes in warfare. In the heroic age aristocrats had been the most powerful warriors. Riding to battle on a horse or in a chariot, they often fought only their social equals. Now the hoplite, a heavily armed, middle-class soldier, fighting as part of a unit called a phalanx, became the core of the city state's army. The new middle class, who could afford the armour but not the horse, demanded a share of the political power. When the aristocrats refused to accept reforms, the ensuing conflict with the lower classes turned into class warfare.

In some cases of civil strife in the city states a disgruntled aristocrat would lead the people in revolt against the aristocracy. These “class traitors” eventually acquired the name *tyrannos* (tyrant). Cypselus became tyrant of Corinth after the aristocratic family, the Bacchiadae, were overthrown. The 5th century ^{BC} was virtually the age of tyrants in Greece, a time when the old aristocratic system was breaking down, to be replaced by oligarchies, or democracies. The civil strife ended in some city states, such as at Athens, with a democratic form of government. Elsewhere it produced oligarchies. In Sparta, however, the regime was successful in suppressing any democratic tendencies that threatened the prevailing aristocracy.

Athenian aristocratic families included the Alcmaeonidae, Philaetae, Eumolpidae, Phytalidae, Eteoboutadae, and Lycomidae. Individual Athenian aristocrats included Draco, Solon, Hippias, Cleisthenes, Pericles, and Alcibiades. Individual Spartan aristocrats included Lycurgus and Leonidas. The Presocratic philosopher Heraclitus of Ephesus was an aristocrat, as were many other philosophers, including Plato. The rise of democracy reduced the

power of aristocrats, yet they often provided the leadership in many fields.

Plato in his *Republic* advocates rule by an aristocracy of intellect. Generally, aristocrats have avoided intellect as a criterion of membership in the aristocracy because there is no guarantee that remarkable aristocrats will have anything other than ordinary children. Aware of this, Plato rejected physical succession in his *Utopia* in favour of a system of recruitment that sought the best and brightest, even if born into the lower orders. Aristotle's theory of aristocracy, as developed in the *Politics*, has been used over the centuries to support aristocratic aspirations. He argues that aristocracy is the good form of rule by the few because they are the best from virtue, and that such a regime itself cultivates virtue in the city state.

In the Hellenistic age a few aristocratic families continued their traditions, but for the most part the Hellenistic kings ruled through bureaucracies, as did the Romans.

Aristophanes

Athenian comic dramatist of the 5th–4th centuries BC

Aristophanes composed 40 comedies, 11 of which have survived, the earliest of these being datable to 425 BC and the last to 388. In the course of the Classical period comedy underwent great changes in

character and structure. Aristophanes is a representative of Old Comedy – its supreme representative, in the judgement of late antiquity, and therefore the only one whose works have survived.

Nothing quite like Old Comedy exists in the modern theatre; it comprises elements of farce, but includes much that we associate with pantomime, situation comedy, savage political satire, and animated cartoons. Its dramatic time is always the present, and its topicality constitutes one of its essential differences from the universality of “New Comedy”, which held the stage two generations after Aristophanes’ death. The characters in some of his comedies were living people known to the audience, such as Euripides (in *Acharnians*) and Socrates (in *Clouds*). The plot sometimes turns upon an issue which was a real political issue at the time of performance.

By no means are all Aristophanes’ plays political, and whether they are or not, the resolution of the plot entails unlimited fantasy. In *Birds*, for example, a plausible Athenian persuades the (Greek-speaking) birds to build a city in the sky and lay siege to the gods; and in *Frogs* the god Dionysus travels to the underworld and presides over a poetical contest between the ghosts of Aeschylus and Euripides. The operation of cause and effect in the world as we know it is suspended to whatever extent the poet wishes, and the audience is not expected to say “But how could...” or “But surely...!” because consistency is readily sacrificed. In *Lysistrata*, for instance, an Athenian woman organizes the citizens’ wives of the belligerent states to go on a sex strike until negotiations for peace are opened. The plot envisages that while the younger wives stay at home, tantalizing and frustrating their husbands, the older women occupy the Acropolis; but then we find that *all* the wives have shut themselves away on the Acropolis.

Whereas there is some evidence that some of Aristophanes’ plays were performed in the Greek cities of southern Italy and Sicily for a while after his death, that seems not to have been the case in Athens, where popular taste in comedy changed rapidly and fundamentally. In the 3rd century BC, however, scholars were attracted to the reading and study (though not the performance) of Aristophanes, and successive commentaries on his texts were composed. By about AD 900, when interest in ancient pagan literature revived at Byzantium after a long lapse, manuscripts of 11 out of the original 40 plays could still be found, and within those 11 a canon of three took shape: *Wealth* (*Plutus*), *Clouds*, and *Frogs*. *Wealth*, far in the lead in respect of the number of medieval manuscripts which contain it, owed its popularity and educational utility to the universality of its theme – the “injustice” which everywhere rewards the dishonest and impoverishes the righteous – and to the consequent paucity of references which demand antiquarian knowledge. Its comparative avoidance of outright

obscenity and of difficult passages in elaborate poetic language no doubt contributed to its high status.

Aristophanes became known to western European scholars in the 15th century; the first printed edition of his plays appeared in 1498, and many Latin translations followed (there was even an Italian translation in 1545). When an individual play appeared in a modern language, it was usually *Wealth*, for the Byzantine evaluation, inherited by the Renaissance, prevailed for nearly three centuries. After the beginning of the 19th century school editions of all the plays, together with translations for the educated public, proliferated. The editions were often ruthlessly bowdlerized by excision, which obscured the point of jokes, as did evasive paraphrase in translations.

According to an ancient anecdote, Plato told the Syracusan tyrant Dionysius that for a proper understanding of Athenian democracy a thorough reading of Aristophanes was essential. That advice was not taken (and probably not known) by the protagonists of the Hellenic cultural revival which from small beginnings in the 17th century increasingly came to engage Greek intellectuals at the end of the 18th century. While school pupils in the west were becoming well acquainted with Aristophanes, he had no place in the 30 volumes of Korais' *Hellenic Library*, and first found a modern Greek editor (Neophytos Doukas) in 1845. Doukas, rather like the Byzantine scholars, valued Aristophanes above all as an exponent of the Classical Attic language, whereas Korais and other participants in the Greek revival were aiming at moral and intellectual regeneration, an end to which a poet so often frivolous, cynical, and obscene did not seem to make a contribution of value. Within living memory, students at Greek universities heard no lectures on Aristophanes. There exists, however, in Greece a long and rich tradition of obscene, satirical, anti-establishment popular song, together (in some regions) with touring market-square comic performances, and it is noteworthy that the first translations of Aristophanes into demotic Greek (by Rangavis) coincided with the introduction in 1860 of shadow-plays whose stock characters always included an ingenious and imaginative rogue of Aristophanic type (*karaghiozis*). During the last 50 years performances of Aristophanes in demotic translation have come to be one of the most striking achievements of the modern Greek theatre.

In a typical Aristophanic play a substantial part is played by a chorus, sometimes representing animals, birds, insects, or personified abstractions. That is a tradition which Aristophanes inherited, for a vase painting dating from long before his time depicts men dressed as birds dancing in line. The chorus of *Wasps*, pitiless old jurymen, is a metaphor realized in the flesh. Except in his last two plays, *Women in the Assembly* (*Ecclesiazusae*) and *Wealth*, where we see the start of the

process which soon led to the limitation of the chorus's role to song-and-dance intermezzi for which the poet did not write the songs himself, the chorus at a central point in the play steps wholly, partly, or minimally out of its role in the plot and addresses the audience directly. It may speak for the poet, as "he" or (as part of the time in *Clouds*) "I", denigrating the poets who were his rivals for prizes at dramatic festivals; it may criticize, often with a light and humorous touch, political behaviour of the citizen body; or it may (as in *Birds*) exploit with jocular imagination ideas which emerge from the plot of the play. This direct address to the audience, usually preceded and followed by lyric hymns addressed to deities, is the "parabasis" of the play, and it raises the question: when it seems to us to be serious, is it really serious?

On one occasion at least it is hard to avoid saying "yes". In *Frogs* the parabasis urges the restoration of citizen rights to the men who had been disfranchised for their involvement in an oligarchic revolt six years earlier. That was a practicable step (even if unwise), and a step actually taken some months later after disastrous defeat at sea. But it is not just in the parabasis that the question arises; it is raised also by the purposes which the "hero" of the play (there is not always one) realizes triumphantly. We can be certain that the audience of *Acharnians* contained some people who shared the view that going to war against Sparta had been a mistake and that there was now an opportunity to stop it, because we know that not everyone had favoured war at the start and that in its second year, under the impact of the plague, the assembly had seriously contemplated negotiation for peace. It is wrong, though, to think of Aristophanes as a pacifist in the modern sense; between the belief that killing is always a sin and the recognition that there are times when peace is more advantageous there is a considerable gap. Perhaps, diffidently, he was a feminist, who in *Lysistrata* and *Women at the Thesmophoria* gives a powerful voice to the dissatisfactions of women, though to his audience the idea that women (or sheep, or sharks) could organize themselves like men would have been intrinsically funny, and *Women in the Assembly* treats women as preoccupied with food, drink, and sex.

While his parodies of tragedy can be acquitted of malice, his uninhibited attacks on named individuals can hardly be dismissed as harmless fun, seeing that at the end of *Clouds* Socrates and his disciples, driven out of the school by fire and pelted with stones, suffer the fate of traitors whose crimes were judged so monstrous as to deprive them of the law's protection. Plato blamed Aristophanes for creating popular prejudice against Socrates; and there were a few critical occasions on which vilification of named individuals on the comic stage was temporarily forbidden by law. Perhaps humorous

periodicals which are frequently sued for libel are the nearest modern equivalent to Aristophanes.

Biography

Born probably in the 450s BC, Aristophanes was the greatest exponent of Old Attic Comedy but little is known of his life. Of 40 plays written by him, 11 have survived, ranging in date from 425 to 388 BC. They are now popular on the modern Greek stage. Aristophanes died c.386 BC.

Aristotelianism

It is not possible to understand “Aristotelianism” properly without understanding the complex reception of Aristotle’s works. It is true that there are concepts one immediately associates with Aristotle’s teachings – the four causes, the doctrine of the mean, and the like – but Aristotle meant many things to many readers over time. As is well known, Aristotle’s writings were not in circulation for more than two centuries after his death. It is not entirely clear who was responsible for recovering them, but copies of his works were evidently available in Rome in the 1st century BC. Aristotle’s ideas had little detectable influence, however, except in the fields of rhetoric and cosmology. It was not until the 3rd and 4th centuries AD that Aristotle was the subject of lectures and commentary activity in the schools of philosophy at Alexandria and Athens, notably by the Neoplatonists, Porphyry and Alexander of Aphrodisias, both of whom concentrated mainly on the works comprising the *Organon*. Porphyry’s *Eisagoge* (Introduction) to Aristotle’s *Categories* was enormously influential through the Greek and, later, the Latin Middle Ages, as was Alexander’s commentary on the *Topics*. These Alexandrian and Athenian exegetes, however, were concerned above all to reconcile Aristotle with Plato, on the assumption that in the works of both one could find the truths of philosophy, but expressed differently. By comparison with Plato, they found Aristotle notoriously obscure – intentionally, these commentators explain. In the 6th century significant commentary activity was carried on by John Philoponus and Simplicius, both students of the Neoplatonist Ammonius Hermeiou in Alexandria. In Ravenna, then the capital of the western Roman empire, Boethius produced a translation of the *Topics* into Latin and commentaries (now lost) on the *Analytics*. The Boethian version of the *Topics*, along with his *De Differ-entiis Topicis*, formed the core of the “Old Logic” that was to persist well into the Latin Middle Ages.

As early as the 4th century Aristotle was being translated in Edessa into Syriac. These Syriac versions formed the base for translations into Judaeo-Arabic and, in 10th-century Baghdad, into Arabic. These aroused keen interest among Muslim scholars both in Baghdad and, in the two succeeding centuries, in Moorish Spain. Among the most influential of those scholars were al-Farabi (d. 950), Ibn Sina (Avicenna) (d. 1137), and Ibn Rushd (Averroes) (d. 1198), all of whom produced editions, with commentaries (often collating Greek manuscripts checked against the Syriac), of Aristotle’s major works

with the exception of the *Politics*, the *Eudemian Ethics*, and the *Magna Moralia*. Like their Greek Neoplatonist predecessors, whose prolegomena and commentaries they also translated and studied, Arabic exegetes understood Aristotle as the author of a closed system and supposed him to be in complete agreement with Plato.

Aristotle 384–322_{BC}

Philosopher

Aristotle was born at Stagira in Chalcidice; his father, Nicomachus, was court physician to the Macedonian king Amyntas III. At the age of 17 he went to Athens to study at Plato's Academy, remaining a member for 20 years (first as a student and later as a teacher). Shortly after Plato's death in 347_{BC}, he left Athens for the court of Hermias at Atarneus in Asia Minor. He lived for two years on the island of Lesbos, where he engaged in some zoological researches and met Theophrastus, who was to become his student. In 343_{BC} he went to the court of the Macedonian king Philip II at Pella and there served as tutor to Philip's son, Alexander. In 335_{BC}, when Athens had come under Macedonian rule, Aristotle returned and founded his own school, in the Lyceum (a sanctuary located outside the eastern section of the ancient wall). There was a *peripatos* – a colonnaded walk – in the building, from which the school acquired its name – the Peripatetic school. On the death of Alexander in 323_{BC} there was an eruption of anti-Macedonian sentiment in Athens, and Aristotle himself was charged with impiety. He fled and came to reside on a family estate at Chalcis on the island of Euboea. One report has him stating that he fled “so that Athens might not commit another crime against philosophy” (in 399_{BC} Socrates had been charged with

impiety, found guilty, and sentenced to death.) He died at Chalcis a year later, perhaps of a stomach ailment.

Aristotle was a student of Plato, but his own writings clearly show that he was by no means a Platonist. (Some of his early works, of which only a few fragments survive, contain Platonist elements, but these may have been propagandist writings for the Academy.) Plato's grand theory was that of the Forms. He held that certain unitary, unchanging, and perfect realities exist in a realm beyond perception. Among these realities are the Good Itself and the Beautiful Itself. The theory of the Forms has both ontological and epistemological aspects. The Forms are basic realities and so the existence of all other things (within our own changeable and imperfect realm of perception) is dependent upon them. Further knowledge, for Plato, is a cognitive grasp of the Forms. Knowledge is gained, not through a process of justification (in which experience or belief is built up into knowledge through argument or investigation), but through a process of discovery. To come to know the Forms is to turn the mind's eye towards these self-justifying realities.

Aristotle explicitly rejects the theory of the Forms. His ontology and epistemology are profoundly anti-Platonist. For Aristotle, individual substances – such as “this man here” and “this horse here” – are ontologically basic. (It has been suggested that Aristotle's emphasis on biological individuals, in contrast to Plato's emphasis on quasi-mathematical individuals – the Forms – is due to the influence of the profession of Aristotle's father.) All else is dependent upon these primary substances: particular quantities and qualities would not exist if primary substances did not exist. Further, the universals that range above individual substances – universals such as man, horse, and animal – are substances only in a derivative sense. These indicate the character of a plurality of primary substances, but they do not exist as unitary basic realities. Thus, Aristotle reverses the Platonic model: he takes what is changeable to be ontologically basic and he denies that universals are substantial unities.

Scientific knowledge, according to Aristotle, is a cognitive grasp of the cause of a thing together with an understanding that the cause could not be otherwise. Aristotle thought of the sciences as axiomatic deductive systems. (Here Plato's fascination with mathematics may have been of some influence.) According to his view, one has scientific knowledge when one can demonstrate the cause of a thing from first principles. These first principles are better known and prior to the conclusion of a scientific demonstration. Thus, for Aristotle, knowledge of, say, why snakes have a larynx but no epiglottis is akin to knowledge of why two triangles with the same base and height are equal in area. In each case, knowledge is secured through

demonstration from the first principles of the relevant science. First principles, however, cannot be demonstrated. These must be grasped by some other means. Aristotle holds that our perceptual experience provides the ultimate justification of first principles. Our nature is such that we store perceptions within the soul. Owing to memory we come to have experience (a grasp of concepts based on particulars) and owing to experience we come to entertain the principles of science (concepts involving the grasp of strict universals). For example, Aristotle asserts that it is from perceptual experience that we grasp the truth that an eclipse is a certain loss of light on the moon. This, however, is not knowledge of the cause of an eclipse. Knowledge of the cause – obstruction of the sun's light by the Earth – is secured through a process of inference to the best explanation. Other candidate explanations (say, rotation of the moon) fail the test of perceptual experience (our familiarity with the precise pattern of loss of light on the moon during an eclipse suggests that the rotation of the moon is not a suitable explanation). Reason tests candidate explanations against our perceptual experience and so it is this experience that provides the ultimate justification of first principles. Aristotle's empiricism, thus, lies in stark contrast to Plato's rationalism.

Aristotle was the first philosopher to develop a theory of formal logic. His theory of deductive inference is that of the categorical syllogism. By first establishing the validity of four "perfect" (axiomatic) syllogistic forms, he was able to show which remaining standard syllogistic forms are valid. (Out of 256 standard syllogistic forms, only 24 are valid.) Aristotelian logic was for two millennia treated as the whole of logic. The logical writings constitute a singular and unparalleled achievement and Aristotle was himself aware of this. In a rare self-congratulatory passage he lauds his own achievements in logic as being entirely without precedent among Greek philosophers.

In areas where his predecessors had expounded theories, Aristotle would often begin his own studies by setting out, analysing, and comparing their views. He would then explore what is common among such theories, mark differences, and locate areas in which such theories stand at odds (with one another, with the perceived phenomena, or within themselves). He would then guide his own positive investigation in the light of the results of this inquiry. In such inquiries Aristotle sought to preserve what is true in earlier theories and to understand better the difficulties within a given field. (He claimed that it is impossible for one to untie a knot that one does not know.) Inquiry of this sort occupies the philosophical branch of Aristotle's dialectical method, a method of arguing from the opinions of others.

Dialectical inquiry is most evident in the works on natural science. In these works, among other things, Aristotle sets out and studies the theories of the Presocratic philosophers. We owe practically all that we know of the Presocratics to Aristotle; for a majority of the extant fragments come from his own writings, the writings of his student Theophrastus, and the writings of his Greek commentators (such as Simplicius). Within the works on natural science we find many of the distinctive conceptual advances that mark Aristotle's thought as superior to that of his predecessors. One such advance can be found in his treatment of causality. While many of the Presocratic philosophers had attempted to account for natural phenomena through an analysis of matter, Aristotle argues that a complete treatment of such phenomena must take into account not only material causes, but formal, final, and efficient ones as well. Just as a complete account of a sculpture will make reference to its matter (bronze), its form (shape or organization), its efficient cause (the sculptor who initiated the shaping of the bronze), and the purpose for which it was made, a complete account of the genesis of a living thing, or of the organic functioning of a living thing, will make reference to four causes.

Aristotle utilizes the doctrine of the four causes within both his psychological and his biological works. In his main psychological work, the *De Anima*, he argues that soul is not a body, and yet it is also not an immaterial substance that might exist in separation from the body. Soul is the form of the living body: it is the organization-for-the-sake-of-functioning of the living thing. This theory – hylomorphism – avoids the pitfalls of both elemental materialism (which fails to give an account of purposes or goals in nature) and Platonic dualism (which, when conjoined with the doctrine of the transmigration of soul, fails to give an account of how different kinds of bodies might prove to be suitable hosts for some one kind of soul). The theory of hylomorphism is, perhaps, compromised within Aristotle's account of intellect. He suggests that intellect may be separable from the body. (This move towards dualism is, perhaps, an anomaly within his writings, an anomaly that may betray a Platonist influence.)

The doctrine of the four causes shapes Aristotle's biological investigations. (The writings on biology take up more than one-fourth of the extant corpus.) His view of nature is teleological. Thus, taking the fully developed and flourishing member of the species to be the end towards which the species itself aims, he holds that the biologist must focus his studies on healthy mature adults within a given species. The variety and depth of Aristotle's investigations into the anatomy, development, and habits of animals are dazzling. While a summary of his work in zoology cannot be attempted here, it should be noted that

even into the 19th century naturalists were (re)discovering certain anatomical features of species that Aristotle had already noted in his own researches.

The central concept of Aristotle's ethics is flourishing (*eudaimonia*). The concept is also central to his political writings, for he asserts that the main function of government is to promote *eudaimonia* among its citizens. He thinks that, since humans differ from other animals in so far as they are rational, flourishing for a human must be living a certain life of active reason. We are rational, however, in two ways: part of us exercises reason and part of us is obedient to reason. Out of this distinction – a distinction between intellect and passion – Aristotle generates a theory of human excellence that treats both rational excellence and moral excellence. The moral excellences (such as courage and temperance) are means between extremes. To be temperate, for example, is to have an intermediate disposition in respect to bodily pleasures. These excellences are acquired through habituation. One becomes courageous, for example, by doing courageous things (even if at first one does not do courageous things courageously). The intellectual excellences (such as wisdom and prudence) are not means between extremes. These excellences are not acquired through habituation, rather they are taught. In his discussion of the best life, Aristotle places special emphasis on the intellectual activity of contemplation. He maintains that the life of contemplation is the best life: it is the best life in so far as it involves the activity of some divine element within us.

Aristotle's conception of God is linked to his cosmological theory. He holds that the earth is the centre of a finite spherical cosmos and that the heavens are constituted by a set of nesting concentric spheres that move eternally in perfect circles. The motion of the spheres has a first cause. This cause is an unmoved mover: it is an immaterial god. The unmoved mover (the highest sort of being) engages eternally in thought (the highest sort of activity). It is not the generative cause of the cosmos. Rather, it lives an exalted life of contemplation. The unmoved mover is eternally self-thinking thought.

After Aristotle's death Theophrastus became the second head of the Peripatetic school. Under his leadership the school thrived. He was a talented empirical scientist and a vigorous thinker intensely interested in the study of Aristotle's works. After his death the Peripatetic school fell into decline. His successors were either highly specialized thinkers (like Strato) or markedly unoriginal thinkers (like Lyco). It is probable that the Peripatetic school in Athens did not survive into the 1st century BC. Aristotle's thought, however, did not perish in the Lyceum. A considerable number of his writings have survived. In the 1st century BC Andronicus of Rhodes produced an edition of Aristotle's

works and from the time of this edition there has been a continuous history of the transmission of Aristotle's texts within the Greek tradition. (The corpus as we now have it contains, perhaps, one third of what Aristotle had written.) Texts survived, but in addition Aristotle's thought did not go the way of dead dogma: his works were studied in the Neoplatonic schools of Athens, Constantinople, and Alexandria. Some of his doctrines found their way into Neoplatonism itself. (For example, the doctrine of the unmoved mover as self-thinking thought clearly reemerges in the writings of Plotinus.) These schools established a tradition of writing commentaries on Aristotle's works and in so doing they secured his legacy within Hellenic culture.

Biography

Born at Stagira in Chalcidice in 384 BC, Aristotle studied at Plato's Academy in Athens and remained there until soon after Plato's death (347 BC), when he moved first to Asia Minor and then Lesbos. On Lesbos he met Theophrastus, who became his pupil. In 343 he moved to Pella in Macedonia as tutor to the son of Philip II, Alexander. In 335 he returned to Athens and founded the Peripatetic school in the Lyceum. After Alexander's death he was charged with impiety and fled to Euboea where he died in 322 BC.

Aristoxenus

Writer on music in the 4th century BC

Born around 370 BC in Taras (Latin Tarentum; modern Taranto), Aristoxenus grew up when this town was ruled by Archytas the Pythagorean. His first instructor was his father Mnesias, a musician, and it is by this title, *musicus*, that Aristoxenus was persistently called, although in his case this term must be understood to refer primarily to his theoretical writings on music rather than to the skill he had in singing and in plying instruments. (That he has such abilities is demonstrated by his basing his theory of harmonics on aesthetic principles at variance with the purely mathematical views of more orthodox Pythagoreans.) His later teachers included the obscure Lampros of Erythrae (perhaps while still in Taras), then the Pythagorean Xenophilus, and finally Aristotle. His reputation in the Lyceum was such that he expected to be head of the school after Aristotle's death. That the headship fell instead to Theophrastus, whose interests were as wide-ranging as Aristotle's (including some technical works on music), should have come as no surprise.

Aristoxenus, for all his 453 books (as tallied by the *Suda*) on various philosophical, biographical, and historical topics, seems to have concentrated his best efforts on music. Indeed, we now know very little of his straightforward philosophical works, not even how large a proportion of the whole they formed. His comments on the nature of the soul owe little if anything to Aristotle's *De Anima* but have more to do with Pythagorean ideas of harmony in the soul such as are found in Plato's *Phaedo* and *Timaeus*. Since our sources (chiefly Cicero and Lactantius) associate these ideas with musical harmony, Aristoxenus may well have introduced them in his musical writings rather than in

a separate work on the nature of the soul. Some sources refer to his *Hypomnemata* (Memorabilia), but this is a catch-all title that says nothing about the work's subject matter; other sources add the word *Miscellaneous* to the title. Here too Aristoxenus is said to have discussed musical matters, although perhaps not as technically as in his treatises devoted to the subject. Even his biographies may have been chosen because of his interest in music. This is obviously so in the case of his comprehensive work entitled *On Tragic Poets* and a separate life of Telestes the dithyrambic poet but, even in his biographies of Plato, Socrates, Archytas, and, of course, Pythagoras, he would have had much to say about their views of music as well as more usual matters, such as Socrates' two wives and Plato's travels. The quality of his biographical writings was praised by none other than the master of the genre, Plutarch, comparing the great and unalloyed pleasure they provide to that obtained by reading Herodotus or Homer.

We also hear of works entitled *Rules of Education* (in at least ten books), *Political Laws* (in at least eight books), *Mantinean Character*, and (if different from the last) *Praise of Mantineans*. Most of these fragments have nothing to do with music: they discuss the difference between two words having to do with shame, the fact that one educates one's son best by making him a citizen of a well-governed cit, that Lycurgus died in Crete; but even here (in *Political Laws*), Aristoxenus has something to say about the composition of pseudo-Epicharmic verses by Chrysogonus the *aulos* player.

Aristoxenus truly deserves his title of *musicus*, then. In addition to some of the pertinent works named above, we hear of and learn a little about the following: *On Music*, *Course on Music* (these may be two titles for the same work), *On Music in Lyric Poetry*, and *Praxidamantea* (presumable on the views of the musical theorist Praxidamas). Significant portions, however, are extant of works entitled *Elementa Rhythmica* and *Elementa Harmonica* (in three books), although the latter seems rather to be selections from two distinct works. These actual words of Aristoxenus can be further supplemented by passages in later writers who drew freely from Aristoxenus: Porphyry, Michael Psellos, and two anonymous works.

Much of these two works is concerned with the technical details of notes, tempi, modes, scales, intervals, etc., but it is plain that Aristoxenus considered himself to be an innovator in the writing of musical theory. Arguing against those who, although ignorant of the true nature of music, nonetheless denied it any significance, Aristoxenus also distinguished himself from the extreme intellectualism of the Pythagoreans (see above), although he accepted some of their view on the relationship between music and ethical

behaviour. He could not, however, bind himself to a rigidly mathematical scheme that failed to take into account the slight but inherent disparities that are as much a part of music as (his example) the deviations from straight lines that woodworkers and other craftsmen in visual arts incorporate into their products. These deviations can be perceived, and then described, only by someone skilled in music.

Later writers on music theory made frequent reference to the theories expounded by Aristoxenus (even when they do not name him), some going so far as to ally themselves specifically with him in opposition to Pythagorean views.

Biography

Born c.370 BC in Taras (now Taranto) the son of a musician, Aristoxenus was taught first by his father, then by Lampros of Erythrae. Probably in Athens he was a pupil of Xenophilus and then joined Aristotle's Lyceum. He wrote copiously – 453 books according to the *Suda* – and mostly on music. He failed to succeed Aristotle as head of the Lyceum. His date of death is unknown.

Armenia

In the Classical and Byzantine periods Armenia covered roughly the rugged upland plateau southeast of the Black Sea, south of Iberia (Georgia), and southwest of Caucasian Albania (Azerbaijan) and the Caspian Sea and also the more fertile lands of the upper Tigris valley; but its boundaries fluctuated greatly and it was frequently fragmented. Its early history is largely dependent upon foreign sources since the Armenian alphabet was not devised until c.AD 400 (although governmental documents and other texts were written in Iranian in Aramaic characters, Greek or, for some ecclesiastical documents, Syriac), and even for a few centuries after that most native histories were ecclesiastical and with little interest in secular matters.

The origin of the Armenians is mysterious. Although their language is the sole member of an Indo-European subgroup, they were probably of ancient Anatolian stock akin to the Hurrians and entered the failing kingdom of Urartu, with its capital at Van, from the west around 600 BC. The area's subsequent status as a satrapy of the Achaemenid Persian empire earned it brief mention by Herodotus (e.g. 3. 93), but the first substantial documented contact between Armenians and Greeks is given by Xenophon, who led the Greek mercenaries safely home from Mesopotamia through Armenian territory in 401– 400 BC (*Anabasis*, 4. 4 –5). After his victory at Gaugamela in 331 over Darius III, for whom Armenia had furnished 40,000 infantry and 7000 cavalry, Alexander appointed Mithranes, the turncoat son of the last Persian satrap, as its governor. Although the Seleucids never exerted direct control over the principalities of a usually fragmented Armenia, Greek influence grew rapidly and can be seen most vividly today in seven inscriptions cut into a rockface at Armavir in the Araxes valley around 200 BC, one of which refers to Hesiod while another is a compilation of extracts from Greek dramas. Seleucid overlordship ended when Anti-ochus III was defeated at Magnesia in 190 BC by the Romans, who allowed his two Armenian satraps Artashes (Artaxias) and Zareh (Zariadris) to establish themselves as kings of Greater Armenia and Tsophk (Sophene) respectively.

Greek acculturation increased, notably in the 1st century BC during the reign of Tigran II who, before being forced in 66 BC to cede many of his conquests and accept Roman suzerainty, briefly, in alliance with his father-in-law Mithridates VI Eupator of Pontus and chiefly at the

expense of Parthia, made Armenia an important empire stretching from the Caspian to the Mediterranean. He built in the Hellenistic style his new capital Tigranakert (Tigranocerta, possibly the later Byzantine Martyropolis), to which he removed many thousands of Greeks. His philhellene inclinations continued under his son Artavazd II, who maintained a theatre and is reputed to have himself written tragedies and other forms of literature in Greek. For much of the Roman period Armenia was a buffer state (and often the site of warfare) between the Roman and the Parthian or, later, the Sassanian empire, although the Romans did annex a small portion west of the Euphrates (Armenia Minor) and briefly under Trajan the whole area (Greater Armenia). Latin, however, made no headway and the elite continued to use Greek (and Iranian) in addition to their native tongue. The correspondence of Libanius, the celebrated rhetorician of Antioch in the 4th century AD, indicates that he taught at least 20 Armenian students. Owing to the swift and thorough conversion of the Armenians to Christianity (which became the official religion in 314) by the Parthian missionary Gregory the Illuminator, little Graeco-Armenian art survives and, owing to their scrupulous adherence to the commandment prohibiting the making of graven images, almost no sculpture. The sole surviving temple is a magnificent grey basalt peripteral Ionic structure erected by the Arsacid Trdat (Tiridates) I in the second half of the 1st century AD and preserved only through its conversion into a royal summer residence (though ruined by an earthquake in 1679 it has been reerected). Once housing a statue of Mithras, it still displays a luxuriantly carved frieze of Armenian and Hellenistic motifs. In the neighbouring Roman bath-house a mythological mosaic of Ocean and Sea offers the curious Greek inscription “we worked without reward”.

Army

Armies and war making were the focus of one of the landmarks of early Greek culture, Homer's *Iliad*. The epic poems of the 8th century BC looked back to the battles and warriors of the Bronze Age, so vividly depicted in the *Iliad*, with awe and fascination. War making played a key role in the Mycenaean heroic age and its aftermath, after 1100 BC, when the Dorians, Iron Age warriors who invaded and eventually settled in Greece, changed the political and social landscape. The dearth of historical and archaeological information on the post-Mycenaean years, the so-called Greek Dark Age between 1100 BC and 800 BC, makes it difficult to ascertain the exact causes and consequences of the decline of the Mycenaeans. It appears, however, that the decline of Mycenae had begun before the advent of the Dorians. It appears also that a series of invasions by the armies of the migrating Sea Peoples (who overran the Hittite empire, and sought to conquer Egypt, and one of whose tribes, the Philistines, settled in Palestine) were among the factors leading to the general exhaustion that marked the Mycenaean world even before 1100 BC. After 1000 BC Greek society was reduced to small local communities, from which there gradually emerged the city state (polis).

Military conflict between the city states of mainland Greece was not rare even at a later period, between the 8th century BC and the

beginning of the Persian Wars in the early 5th century BC. Yet, with the exception of Sparta, the city states sought to avoid the maintenance of a standing army. By the time of the first Persian War (490 BC) most city states used cavalry, but its extensive use was confined to the Thessalian League. For the rest, their military strength was represented by the organization of the infantry. The hoplites, the armed citizen-soldiers, fought on foot and were organized in companies (*lochoi*) and platoons (*enomotiai*). In the ten years between the first and the second Persian War (480–479 BC), Athens concentrated on strengthening its sea power by building a large trireme fleet. After the Persians' devastating defeat in 479 BC, which ended the Persian threat to the Greek world, Athenian hegemony was established gradually in mainland Greece and, with the help of the Delian League, throughout the Aegean, from Thasos to Rhodes.

Armies in Classical antiquity represented the organized mobilization of citizenry in case of war. Therefore, while military conflict was not uncommon, it implied the temporary militarization of life – again with the exception of Sparta, the only city state in which a militaristic structure and way of life defined all other social and political activity. In Athens the relaxed quality of civic life in the polis during the Periclean age is contrasted by Thucydides to the poisonous atmosphere brought about through war, militarization, and the suspension of many features of the Athenian democracy. The Peloponnesian Wars (460–445, 431–404 BC), caused by a complex series of perceived threats and counter-threats, manifested the consequences of the imperial expansionism of the Athenian League and the commitment by Sparta and the Peloponnesian League to total victory and the destruction of the power of Athens. In particular the second, so-called Great, Peloponnesian War displayed a succession of intense clashes and a relentless crusade towards total supremacy. It was the dominance of that mentality in both camps that explains the Sicilian expedition in the final years of the war, a colossal undertaking by Athens aimed at conquering Sparta's allies in Sicily. The defeat of Athens left Sparta in the position of a dominant player. But the inward-looking character of the Spartan regime, combined with the fragmentation of the Greek city states and the efforts by the Persians to influence political developments in Athens and elsewhere, resulted in political complications which moderated the significance of the Spartan victory.

The rise of Macedon in the 4th century BC, which soon put an end to Spartan supremacy, owed much to the military innovations introduced and perfected by Philip and his son Alexander the Great. These were the development of siege weaponry to obviate the need for lengthy blockades, and the perfection of infantry/cavalry tactics based on new

models for the organization of the deep phalanx, which enabled complex manoeuvres and combined infantry/cavalry deployment (Connolly, 1977 and Humble, 1980). In the invasion of Asia Alexander led an army in which not only Macedonians but all Greeks participated, with the exception of the Spartans. After Alexander's death (323 BC) the Macedonian empire suffered the wars of the generals, which introduced the war elephant to the battlefield. The fragmentation of the Hellenistic world, the result of intense conflict between Alexander's successors, prepared the ground for the gradual absorption of large segments of that world into the emerging Roman empire.

Arrian c.AD 90–160

Historian

In his preface to the *Anabasis of Alexander* Arrian declares that wherever Ptolemy and Aristobulus, the Alexander historians, “have both given the same accounts of Alexander the son of Philip, it is my practice to record what they say as completely true, but when they differ, to select the version I regard as more trustworthy and also more telling”. He has chosen these two authors because both of them took part in Alexander's expedition and both wrote after his death, thus not being “under any constraint or hope of gain”, particularly Ptolemy, who became king. Other accounts Arrian intends to record only as “tales” told of Alexander (Praefatio, 1–3). In this unique statement on principles of selection and use of sources Arrian sweepingly disqualifies the bulk of his predecessors, including Callisthenes (mentioned only as a historical figure in the *Anabasis of Alexander*), Clitarchus, Diodorus, and Plutarch, names that never appear in Arrian's extant works. In the so-called “second preface” to the same *Anabasis* Arrian even boasts that before him Alexander's exploits were never properly recorded, and that he, at last, “will make Alexander's deeds known to men” (1. 12. 2–5). He also displays a similar attitude elsewhere. In the *Indica* (2. 9) he singles out Eratosthenes as “more trustworthy than any other writer”, and Nearchus and Megasthenes

since both are “remarkable men” (17. 6); in the opening chapter of the *Tactica* he enumerates tactical writers, including Pyrrhus, Polybius, and Posidonius, only to declare them all useless.

Predecessors and sources are not necessarily models. Arrian’s ideal was Xenophon – his career as a soldier and, later in life, as a retired gentleman-writer (*Cynegeticus*, 1). He called himself “Xenophon”, and was nicknamed the “new Xenophon” by later biographers. Arrian was indeed as prolific and versatile a writer as Xenophon. Like Xenophon, who started his intellectual career as a disciple of Socrates, Arrian began his as a disciple of Epictetus, turning thereafter to other subjects. Yet, he did not write contemporary history as Xenophon had done. All his historical work bears upon the past: the *Antiquities of Bithynia*, the monographs on Dion and Timoleon, the *Anabasis of Alexander*, the *Events after Alexander*. Actually, he must have had more than one model. Herodotus, for example, is quoted and used several times. Arrian’s works bristle with Herodotean reminiscences in content, in vocabulary, and in style. In true Herodotean fashion he reports versions that he does not credit, has reservations about his sources, and leaves it to others to judge or explain. In the *Indica* he even adopts the Ionic style. Sometimes he feels compelled to find a compromise between Herodotus and his avowed model Xenophon. A case in point is his belief in the existence of Amazons in mythical times, as attested by Herodotus and by Athenian funeral orators, while disbelieving their survival in historical times, as Xenophon’s silence would suggest (*Anabasis*, 7. 13. 5–6). Arrian’s debt to Thucydides and Theopompus (never mentioned by name) should perhaps remain a matter of speculation, but the influence of Attidography on his local chronicle of Bithynia (*Bithyniaca*) is quite evident. His presumably continuous survey of Bithynian antiquities from mythical times to 74 BC, as well as his self-identification as a priest of Demeter and Core, the tutelary goddesses of Nicomedia, echo a topos already exploited by Cleidemus and Philochorus in the 4th century BC.

Having predecessors, and even being influenced by them, does not necessarily imply slavish imitation. Arrian read and absorbed his sources, but though sometimes he followed them passively, he developed a style of his own. His historical work is a mixture of the “pragmatic” school of Thucydides, Xenophon, and Polybius, and of the encomiastic trend of Alexander-historians such as Callisthenes and the “vulgate” tradition. And, of course, Arrian was a child of his times. The very project of compiling a laudatory monograph on Alexander cannot be dissociated from the impact of the Parthian wars of Trajan on Greek intellectuals, or from the reminiscences and propaganda about the Persian wars emanating in the 2nd century from Hadrian’s Panhellenion in Athens.

Arrian's reputation among his younger contemporaries and later, as having an exemplary career as a philosopher, a historian, or a master of style, is well attested. For Lucian, Arrian was "a disciple of Epictetus, a Roman of the highest distinction, and a life-long devotee of letters", a man who did not disdain writing the life even of the brigand Tilliborus (a work otherwise unknown). Aulus Gellius was acquainted with Arrian's edition of Epictetus' *Discourses*. Cassius Dio wrote a "Life of Arrian the Philosopher" (not extant) and in his *Roman History* he mentioned Arrian's role in the war against the Alani. Dexippus apparently used and followed closely Arrian's history of the Diadochi without mentioning his name. In the 4th century AD Eusebius put Arrian's *floruit* in AD 149/50 and Themistius pronounced him a famous example of a philosopher engaged in public life. In the 5th century Malalas called Arrian a "most wise chronographer" and used his *Parthica* for Trajan's wars. His contemporary Johannes Lydus quoted him on the antiquities of the Parthians. Procopius quotes him on Kytaia, the Colchian city of Medea, and the Neoplatonist Simplicius mentions a *Life of Epictetus* written by Arrian. In the 6th century Stephanus of Byzantium used Arrian extensively, consulting particularly the *Bithyniaca* and the *Parthica* for his own purposes and quoting verbatim several passages.

Photios's encomium of Arrian, appended to the epitome of the *Events after Alexander*, is one of the longest in the *Bibliotheca*. To Photios, Arrian was "inferior to no one of the best writers of history", a true imitator of Xenophon, a writer worthy of praise for his clarity, composition, and style, as well as for his lack of out-of-place digressions and parentheses, and for his traditional choice of words. Photios abridged Arrian's historical works and knew of his edition of Epictetus' teachings. Arrian's reputation for composition is also attested in Byzantine times by the anonymous author of a treatise *On Syntax*.

The *Suda* lexicon has an entry on Arrian and refers to him repeatedly, particularly to the *Parthica*, from which many substantial passages are quoted. A 10th-century collection of *excerpta* includes passages from Arrian's *Anabasis of Alexander*, and a passage from this same work on the statues of Harmodius and Aristogiton at Athens is quoted in the scholia to Proclus' commentary on Plato's *Timaeus*. In the 12th century Tzetzes and the *Etymologicum Magnum* used Arrian's *Bithyniaca*, and Eustathios drew heavily on both the *Bithyniaca* and the *Anabasis of Alexander* for his commentaries on Homer and Dionysius Periegetes, preserving sizeable passages quoted verbatim. Finally, around 1200 the Codex Vindobonensis (Vienna, Nationalbibliothek, hist. gr. 4) was copied, from which all the extant manuscripts of the *Anabasis of Alexander* are descended.

Biography

Born in Nicomedia in Bithynia c.AD 90, Arrian studied under the Stoic Epictetus before moving to Greece (108–12) and a career in the civil service under Hadrian. He served as legate of Cappadocia (131–37) and then retired to Athens where he died c.160. Arrian wrote on a wide range of subjects including geography, hunting, military tactics, and local history, but is best known for his *Anabasis*, a history of the campaigns of Alexander the Great.

Arta

Town in Epirus

The town of Arta lies some 14 km north of the Ambracian Gulf, in a bend of the Arachthus river where it winds down from the Xerovouni mountains to the west coast of Greece. It has always been the principal coastal town of the district of Epirus, and was known in antiquity as Ambracia. Its situation close to the estuary of the Arachthus allowed its inhabitants to reap the agricultural benefits of the flat, fertile, and well-watered surrounding land.

The area was first colonized by Corinth in the late 7th century BC, and a century later had become fully established. Pyrrhus, the king of Epirus, the son of Aeacides and Phthia, consolidated his position by settling there in 295 BC, and was the first ruler to make the town into a substantial capital, erecting many public buildings and sculptures. These were largely removed by the Romans when they took the town in 189 BC, and the inhabitants were moved to populate the new city of Nicopolis.

Astrology

Astrology is a pseudoscience that uses astronomical phenomena to make mundane predictions. Its origins lie in Mesopotamian astral, planetary, and meteorological omens, which were being catalogued already in the 2nd millennium BC in the cuneiform text *Enu-ma Anu Enlil* (much of its material is to be found in later Greek manuals such as those of Ptolemy, Hephaestion of Thebes, and John the Lydian in the 2nd, 5th, and 6th centuries AD respectively). Although it was not at first true astrology, in so far as there was no suggested relationship of cause and effect, increasingly exact astronomical observations from the 7th century BC encouraged the Babylonians to extend their science to making predictions for individual humans. By the late 5th century this Babylonian protoastrology had penetrated a Greek world made receptive through its divinization of celestial bodies. Greeks are responsible for its complex developments made chiefly in the period c.300 BC–c.AD 300.

Astrology is dependent upon a belief in sympathetic magic, which postulates a link between the macrocosm (universe) and the microcosm (man). It is based upon the supposed characteristics and associations with mundane phenomena of the seven “planets” (Sun, Moon, Saturn, Jupiter, Mars, Venus, and Mercury) and the twelve constellations of the zodiac, the latter being groupings as seen from earth of unrelated stars in a moving band eight or nine degrees each side of the ecliptic (the apparent course of the sun’s annual orbit). The attribution of characteristics and associations to celestial bodies has on rare occasions a vestige of reason: thus Saturn, whose orbit is furthest from the sun of the planets known to the ancient world, was considered cold and malign, the cause of freezing weather, pestilences, and scarcity, and in man of dysentery, colic, the bringing up of phlegm, elephantiasis, etc. More typically, however, his lordship over the right ear (like Mercury’s over the buttocks) appears quite arbitrary. Other associations depend upon contemporary theories: for instance, Pythagorean mathematics, by classifying all even numbers as female, dictates that Taurus (the Bull), since it is the second sign of the zodiac, should be female.

The “planets” were seen as moving anticlockwise at various speeds against the zodiacal circle, which itself revolved clockwise against an envisaged stationary circle whose four cardinal points were those of the risings and settings on the horizon of the ecliptic and the zenith and the nadir. This second circle was divided into usually 12 segments or “places” (today commonly “houses”). The degree of influence on mundane phenomena of each celestial body was believed dependent upon its position in respect to other bodies (its “aspects”) and its “place”, but there were so many calculations of often contradictory

evidence that failure of predictions could easily be explained away. This was even more possible with the addition of the *dodecatemoria*, the division of each sign of the zodiac into 12 equal parts of two and a half degrees, each assigned to one of the 12 signs of the zodiac and thus allowing a “planet” to be in, say, the *dodecatamoron* of Scorpio in the sign of Gemini. All astrologers tended to base their predictions upon tables rather than observation, despite the accurately calculated discovery by Hipparchus in the late 2nd century BC of the precession of the equinox (the retrograde movement of the equinoctial points along the ecliptic), and thus continued to work on the assumption that the vernal equinox occurred at the first point of Aries rather than at some point in Pisces.

Believers were divided into those who, through acceptance of a purely mechanistic universe, held that the celestial bodies dictated an ineluctable fate and those who believed that astrology merely gave clues to personalities and trends and whose role was therefore that of a guide. The commonest application of astrology was for genethliology in which predictions were made about an individual on the basis of celestial positions at the hour of his birth or, far less commonly and of course less accurately calculated, his conception. These predictions could be updated by anniversary horoscopes. Large numbers of often astronomically impossible horoscopes have survived on papyrus, while there is one more “scientifically” reputable ancient collection from c. AD 130 in the *Anthologies* of the Antiochian Vettius Valens. Catarchic astrology determined the most favourable moments for commencing various enterprises such as journeys and military campaigns. Largely a subdivision of this was iatro-mathematics which dictated when certain herbs should be picked for greatest efficacy, predicted the course of illnesses, and gave clues as to treatment. Interrogational astronomy was dependent upon the positions of the celestial bodies at the time of the question.

Philosophical underpinnings to Greek astrology gave it respectability. Thus even the supremely competent astronomer Claudius Ptolemy in the 2nd century AD accepted and, indeed, even wrote a textbook (*Apotelesmatika* or *Tetrabiblos*, *Astrology or the Fourfold Book*) on the subject. Opposition was largely aimed at quack practitioners and those who threatened the stability of the state by making public predictions of the death of its ruler. Stoics, with the notable exception of Panaetius, were particularly drawn to astrology by their belief in cosmic sympathy, and in the early 1st century AD Manilius wrote a didactic poem (in Latin) on the subject. Epicureans and Cynics, however, scoffed at it. The most detailed surviving refutations are those of the Sceptic Sextus Empiricus in the 2nd century AD and of Plotinus and Origen in the 3rd century AD. Since

astrology offended the concept of man's free will, Christian opposition was at times virulent but could not entirely extirpate it owing to belief in the "star" that led the Magi to Bethlehem. The 4th-century Priscillianist heretics in Spain even went so far as to hold that God used the celestial bodies to make manifest his will.

Hellenistic astrology passed through Sanskrit translations (most notably the *Yavanatjataka*, Sphujidhvaja's versification of Yavaneśvara's translation of AD 149/50) to India, where it was modified to accommodate local beliefs. Sassanian Iran learned its astrology from both Greek and Indian sources and, before it passed it on to the Islamic world, added another type, the political, wherein predictions were made for whole nations.

Astronomy

Greek astronomy can be defined as the astronomy of epicycles, an invention of the 3rd century BC. To arrive at this solution for planetary movements, the astronomers of the 3rd century had behind them three centuries of observations and mathematical theories.

Little is known about the mathematical astronomy of the Presocratics. Thales of Miletus (7th–6th century BC) is considered to be the first Greek astronomer. He predicted solar eclipses by studying their periodic recurrences, but with an important factor of error. Anaximander (6th century BC) observed the inclination of the ecliptic. Pythagoras (6th–5th century BC) found the "right" (in the geocentric system) order of the planets (Earth, Moon, Mercury, Venus, Sun, Mars,

Jupiter, Saturn, while Aristotle later placed the Sun between the Moon and Mercury). A little more is known about the contemporary of Socrates, Meton, who, observing from the hill of Pnyx about 432 BC, defined the solar–lunar cycle of 19 years.

The observational data (especially those concerning the retrograde planetary motions and Sun and Moon anomalies) were important enough in Plato's time for him to pose the problem of "saving the phenomena" (interpreting celestial bodies' motions by circular orbits with uniform speed). According to Simplicius (6th century AD), it was Eudoxus who produced that system, composed of homocentric spheres. The combination of two spheres rotating with unchanging velocities can effectively represent the retrograde planetary motions. For the motion of the Sun he employed three spheres (one to account for an observation known to have been mistaken), and another three for the Moon.

Eudoxus' system only partially saved the phenomena: in particular it did not take into account the variations in the distance of the heavenly bodies (the variation in the apparent diameter of the Sun or in the brilliance of the planets). This problem was posed during the 3rd century BC. The heliocentric system proposed by Aristarchus of Samos (4th–3rd century) was an adequate response to that problem but, probably for philosophical reasons, it was not followed by the main Greek astronomers. According to a later source, Theon of Smyrna (2nd century AD), a system had been proposed during the 3rd century BC similar to that imagined 19 centuries later by Tycho Brahe. In that system the two "inner" planets, Mercury and Venus, orbit the Sun, while the latter orbits the earth, the centre of the universe. This system resolved far better than that of Eudoxus the motion of Mercury and Venus; it is highly probable that it is the origin of the astronomy of epicycles. Indeed, if the orbit of the Sun is replaced by the deferent cycle of Mercury and Venus, the solution attributed to Apollonius of Perge (born c.244 BC) is reached.

In an effort to respond to the solar anomaly, while respecting the principle of circular uniform motion, 3rd-century Greek astronomers proposed the "eccentric" solution: the Sun travels on an eccentric circle (centred on a point that does not correspond to the earth's centre). This system presented two difficulties: it was not symmetrical and it was contradictory to Aristotelian physics, which could not accept a motion around an imaginary point. It was probably Apollonius who resolved the problem of symmetry, by demonstrating the equivalence of an eccentric to an epicycle travelling around a concentric (deferent circle), while the "Aristotelian" problem has never been resolved. This epicycle plus deferent solution was to characterize all the astronomical systems until the beginning of the

17th century, when Kepler formulated his first planetary law, that of the elliptical orbits.

Between Apollonius and Hipparchus (who was observing at Rhodes c.128 BC), Greek astronomers had developed a complete epicycle plus deferent astronomical theory. By combining the radius and the motions (clockwise or anticlockwise), these astronomers could reproduce the retrograde motion of the planets (but not the fact that the “loops” produced by this motion were not symmetrical) and represent approximately the Sun’s and the Moon’s motion.

By reversing the “methodological” approach of astronomy, Hipparchus played a decisive role in the development of Greek astronomy. According to available information, which comes mainly from Ptolemy, Hipparchus was the first to give priority to the collection of observations in order to find the empirical laws of the motion. After that, he tried to solve the problem by circular uniform movements. Hipparchus tried to determine the radii of the deferents and the epicycles of the planets and computed a successful theory for the motion of the Sun. He also showed how to calculate the Moon’s motion; his work was masterfully completed by Ptolemy.

As for the Sun, Hipparchus determined its eccentricity, resolving thus its principal anomaly, that of the inequality of the seasons’ length. It was probably while working on the theory of the Sun that he made his main discovery, that of the precession of the equinoxes. By comparing historical observations, Hipparchus remarked that, in its annual movement, it took the Sun a little more time to reach the same zodiacal point than to reach the equator: the sidereal year would then be different from the solar year. This phenomenon, due to the spinning-top movement of the axis of the earth, was interpreted by Hipparchus as a very slow movement of the sphere of the stars, from west to east (about 1 degree per century, while the true value is 1 degree, 23 minutes, 30 seconds).

As for the Moon, the problem was much more complicated, as the motion of the earth’s satellite presents six main anomalies. Although Hipparchus knew only one, he did not succeed in resolving it, but he posed the problem of the parallax relating to solar and lunar observations: he said that astronomers must consider the earth as a point only with respect to the fixed stars. He also tried to determine the dimensions and the distances of the heavenly bodies.

The apex of Greek astronomy was the magisterial work of Claudius Ptolemy. His book, the *Great Mathematical Syntaxis of Astronomy*, known as the *Almagest*, finished between AD 142 and 146, included all the astronomical phenomena known at that time. This book constituted a unique advance in the history of science: it was to be the main reference for all astronomers until the work of Tycho Brahe and

Kepler, almost 1500 years later. Indeed, all Greek, Islamic, or Roman planetary astronomy until Kepler can be characterized as Ptolemaic.

Ptolemy continued and concluded Hipparchus' work. His method was similar: to collect as many observations as possible; to show up the anomalies of the planetary motions; to find the empirical laws for these anomalies; to combine various circular uniform movements in order to save the phenomena; to choose the most adequate among the different solutions, and determine the radii and the positions of the circles and the angular speeds; to compute the planetary tables. The coincidence of forecast with observation confirmed the theory.

The main celestial movements according to Ptolemy were the following two: (a) the diurnal motion of the sky from east to west; (b) all other motions, which mainly took place from west to east and close to the ecliptic. Whenever Ptolemy was able to choose from among many solutions, he preferred the simplest. He adopted Hipparchus' solution for the Sun, but for reasons of simplicity he chose the eccentric from the deferent plus epicycle. For all the other heavenly bodies he presented his own solution, which in the case of Venus, Mars, Jupiter, and Saturn involved the famous "equant" (it was given this name during the Middle Ages): the centre of the epicycle does not move with a uniform motion; the circular uniform motion is "transferred" to a point of another circle (the equant). As a consequence, the phenomena were saved (the planets travel faster at their perigee and more slowly at their apogee), but this represented a serious departure from Aristotelian physics and from the principle of uniform circular motion posed by Ptolemy himself. The system was also extremely complicated: Ptolemy even added circles to move the level of the epicycle from that of the deferent!

Ptolemy presented his cosmological speculations (the mechanisms responsible for all the motions of the heavenly bodies) in his book *Planetary Hypotheses*. This work was the precursor of Islamic astronomical theories on the mechanisms of the celestial spheres. Another astronomical work of Ptolemy, the *Handy Tables*, a revised version of the *Almagest*, remained in use throughout the Middle Ages.

The main Greek commentator on Ptolemy was Theon of Alexandria (4th century AD). His commentary on the *Almagest* and two commentaries on the *Handy Tables* were the last important works of ancient Greek astronomy.

Atheism

Atheism conventionally refers to a system of belief that denies the existence of a personal divinity. Taken in this sense, it is of fairly recent coinage in Greek intellectual history. In a broader sense, however, atheism, taken to refer to godlessness or, polemically, to the rejection of particular religious beliefs, has a better-documented pedigree.

Atheos is the Greek for "atheist". This is etymologically an adjective of broad application designating most frequently godlessness or the denial of a particular set of divinities. Thus, for example, in the *Eumenides* by the Athenian playwright Aeschylus, Orestes is called *atheos* because contrary to religious convention he had murdered his mother Clytemnestra, although his conversations with Apollo necessitate his belief in the existence of gods. Likewise, in *Oedipus the King* by Sophocles, the chorus protests its loyalty to Oedipus by wishing to be abandoned by friends (*aphilos*) and gods (*atheos*) alike if it wishes any ill towards him.

The number of known atheists in antiquity is very small. Though the historical record is somewhat fragmentary in most instances, during the latter part of the 5th century BC Athens witnessed a small number of piety trials directed against natural philosophers, who were commonly perceived as atheists. These early scientists became objects of legal persecution largely because of their attempts to substitute natural causality for divine intervention. Diagoras of Melos is traditionally known as "the atheist" although the evidence indicates that he did not reject the existence of all gods. Anaxagoras was more clearly atheistic in his outlook since he specifically rejected the divine nature of the sun by referring to it as a piece of "hot stone". Protagoras held a more ambivalent position by proclaiming his uncertainty one way or the other as to the existence of the gods. Most famously, Socrates was tried and executed in 399 BC because he allegedly rejected the state divinities, introduced new gods, and

corrupted the youth. The truth of these charges is unknowable, but three aspects of the case are significant. First, Socrates was represented in the *Clouds*, a comic play by Aristophanes, as rejecting the gods in favour of apotheosized natural mechanisms. Second, in Plato's *Apology*, a fictitious representation of his defence speech, Socrates specifically denies the charge of atheism, thereby demonstrating his vulnerability on that very point. Third, he is represented by the relevant witnesses as possessing a personal oracle, known as the *dacmonion*, and observing the religious customs of his day, thus leaving him vulnerable to the charge of introducing new gods. Obviously, the atheism of Socrates was not the religious nihilism of the modern era.

Subsequent to Socrates, it is possible to speak of atheistic beliefs within a broader Graeco-Roman context. The Epicurean school of philosophy with its strict materialism and denial of divine intervention in human affairs is chiefly associated with these ideas. The Roman poet Lucretius, writing in the 1st century BC, aimed to popularize this particular outlook with his epic poem *On the Nature of Things*, a spirited challenge to the religious beliefs of his day. Plutarch, who lived during the last half of the 1st century and first half of the 2nd century AD, in his book *On Superstition*, gives atheism a very modern sense, saying that it is a denial of the existence of gods, but adds that it results from spurious reasoning. Doubtless the agnosticism of Marcus Aurelius, the Stoic emperor who reigned AD 161–80, easily falls within the bounds of ancient atheism, Lucian, a contemporary of Marcus Aurelius, describes in his *Icaromenippus* several schools of thought about the nature of the divine, some of which are atheistic, whether in the ancient or the modern sense.

Christians, because they rejected the religious norms of their contemporaries and refused to yield in their monotheistic views, were regularly persecuted for their atheism. Lucian relates how Alexander of Abunoteichos, a spiritual mountebank, incited his followers to stone the Christians because they were blaspheming atheists. For their part, Christians enthusiastically labelled non-Christians and various sectarians as atheists. For example, in his Letter to the Ephesians Paul says that before the coming of Christ the gentiles were “without hope and atheists”. According to Clement of Alexandria in his *Exhortation to the Greeks*, Diagoras and others who were in his view rightly sceptical about traditional Greek religion were not atheists; rather the true atheists were those who upheld pagan religious norms. The Christian apologist Athanasius refers to those who do not share his views on the relationship between Jesus Christ and God as atheists and non-believers. Polemical allegations of atheism aside, it appears that no evidence for intellectual atheism during the late antique period

survives. As one writer has noted of this time, “sceptics and rationalists, if they existed, have left no mark on history and literature” (Jones, 1964, vol. 2, p.957).

Athenaeus

Prose writer of the 2nd century AD

Athenaeus was born in Naucratis, a Greek community in Egypt, around AD 150. He was prominent among the Greek scholars of the so-called Second Sophistic, and but one of several produced by Naucratis. These scholars, Athenaeus included, were concerned with the revival of Classical Greek culture in the context of Roman imperial rule. Athenaeus spent time in Rome in the patronage of P. Livius Larensis, a cultured Roman bibliophile with a strong interest in Hellenism. However, there is no evidence for the frequent assertion that he belonged to the circle of Julia Domna, the wife of the Roman emperor Septimius Severus.

His principal work was his *Deipnosophistae*, (Sophists at Dinner). It is divided into 15 books (not 30, as sometimes claimed), of which the opening and closing books are fragmentary: for these, we depend largely upon an epitome. The *Deipnosophistae* forms part of a long

Hellenic tradition of sympotic literature, a direct descendant of Plato's *Symposium*, Xenophon's *Symposium*, Plutarch's *Sympotic Questions*, and Lucian's *Symposium*, among other texts. However, it is far longer than these predecessors. The diners, 24 in total with the host Larensis included, discuss both the dinner itself and a bevy of issues that arise from particular dishes or circumstances – cooks (Greek and non-Greek), extraordinary concoctions, outstanding banquets, dances, music, musical instruments, furniture, wines, health, cultivated fruits, gluttony, austerity, luxury, scholarship, and humour.

Each diner receives his own characterization, but some are more strongly drawn than others. They include Ulpianus of Tyre, committed to the purity of Attic Greek and always concerned to raise a pedantic point of grammar (and probably not to be identified with Ulpian the jurist); Kynoulkus, a Cynic who takes pleasure in goading the irascible Ulpian; Galen the physician; Masourius, with pretensions to musical expertise; Ploutarchus, a grammarian; and Myrtilus with his taste for proverbs. How far these characters are real people in Larensis' circle remains a matter of doubt: Athenaeus has been suspected of sly humour in his construction and naming of the diners. Certainly, humour is a pervasive feature of the *Deipnosophistae*, both in the interaction of characters and in the dubious and often overblown learning in which the diners compete. The *Deipnosophistae* is best read as a work of both philosophy and satire, appropriately enough in the sympotic tradition.

Athenaeus' work has most often been used as a source for earlier Greek dining or for lost texts, which are quoted very extensively throughout. Its thematic division (e.g. book 7 on fish; book 13 on courtesans) encourages the former approach, while the sheer density of quotation makes the latter inevitable. In accordance with the humorous tone of the work, quotations from Greek comedy are particularly frequent and constitute an enormous part of our knowledge of the genre. Athenaeus' quotations are drawn from some 1250 authors: they include the titles of some 1000 plays and run to some 10,000 lines of verse. The combination of verse quotation and prose text indicates Athenaeus' debt to the genre of Menippean satire.

However, Athenaeus also quotes heavily from prose works, as well as from verse. For example, the historian Callixinus' lengthy account of the grand procession of Ptolemy II Philadelphus is preserved in the *Deipnosophistae*. Athenaeus displays through his characters a historical sensibility far beyond that of an antiquarian. In particular, although his work focuses especially upon Greek culture in its broadest sense, there is also a recurrent concern with the contemporary historical situation, with Rome and its emperors (8. 361f on Hadrian; 12. 537f on Commodus). Moreover, the most recent scholarship encourages the

suspicion that Athenaeus not only preserved quotations, but also inserted his own additions and emendations: in any event, it is often difficult to be sure where quotation ends and Athenaeus' own writing begins. There is also an uncomfortable inconsistency in the details of the setting: the first ten books seem to relate to a single banquet, books 11–14 indicate a second gathering, while the final book 15 contains a third session, the whole covering three successive days, it seems. The dramatic context has been taken to range inconsistently between January (9. 372b), April (8. 361f), and August (3. 99e), whether by authorial error or in consequence of the manuscript tradition. However, although January and August are mentioned in the text, it is only 21 April (the ritual “birthday” of Rome) that is clearly given as the time of the dinner(s).

Athenaeus mentions two further works of his own in the course of the *Deipnosophistae*. Neither survives, but both represent features of the concerns that he displays in the extant work. One may be regarded as a historical work in view of its title, *On the Kings of Syria* (*Deipnosophistae*, 5. 211a). However, the rulers of Syria, who might include not only the Greek Seleucids but even Semiramis, offered ample scope for a wealth of anecdote, humour, and moralistic philosophizing, so that the work may not have been the solid historical text that has often been imagined. Certainly, the short passage quoted in the *Deipnosophistae* suggests that its tone may not have been so very different from that of the extant work. Athenaeus' other work survives only as a title: it was a treatise on Archippus' comedy *Fishes*, produced after 403 BC (*Deipnosophistae*, 7. 329c). This play seems to have centred upon an imaginary treaty between Athens and the fishes, akin to the central conceit in Aristophanes' *Birds*: as with the birds of the latter, the play no doubt raised numerous issues of the identification, terminology, and qualities of a wide range of fish, a matter of keen interest to the author of the *Deipnosophistae*.

The oldest surviving manuscript of the *Deipnosophistae* is dated to the 10th century AD. The work seems to have been much used in the Middle Ages, at least in epitomized form: for his commentary on the Homeric poems, Eustathios draws from the epitome on some 2000 occasions. At present in Greece the term “Deipnosophist” has been resurrected in a series of articles on taste and aesthetics, which appeared in the newspaper *Kathemirini* intermittently from 1989 to 1991 and which have now been collected and published as a book, of which *Deipnosophist* constitutes both the title and its author's nom de plume. The inspiration of Athenaeus is explicitly acknowledged, but the modern work is not a dialogue and does not seek to reproduce the texture or flavour of its ancient forebear.

Biography

Born in Naucratis c.AD 150, Athenaeus was a leading figure in the movement known as the Second Sophistic. He spent some time in Rome as the guest of P. Livius Larensis. His principal work is an example of sympotic literature, the *Deipnosophistae*, which contains quotations from many other works that are now lost, notably comedy.

Athens

Capital of modern Greece

The modern city of Athens extends across the largest plain of Attica at a distance of 6–7 km from the coast to the south. Apart from this southern edge, which opens to the port of Piraeus and the Saronic Gulf, the city is surrounded by mountains, namely Aigaleo, Penteli, Parnitha, and Hymettos in a clockwise direction.

Archaeological evidence shows that the earliest settlement took place during the late Neolithic period around 4000 BC. The substantial remains of later periods have obscured these prehistoric settlements, but we know that the first nucleus of life in the region developed on

the rock of the Acropolis and its cavities, with farms and roughly made huts subsequently spreading to the south. There is evidence of extensive farming, herding, and fishing and of the worship of a goddess of fertility. Subsequently a number of small and independent kingdoms were established around this nucleus, such as those in Kifisia, Brauron, Marathon, and Eleusis; trade links were developed, especially with the Cyclades; arteries to the Peloponnese and mainland Greece to the north were established; and fortifications were built, especially around coastal settlements, but also around the Acropolis in the second half of the 13th century BC. Athens continued to grow amid these independent conglomerations, and by the Late Bronze Age it was undoubtedly considered one of the most prestigious Mycenaean centres, as indicated by wealthy 14th-century BC tombs, the remains of a Mycenaean palace on the Acropolis, and the 13th-century BC fortifications.

It was sometime during the 14th or 13th century BC that all the kingdoms of Attica formed a political union called *Athinai* (in the plural) and centred around the ancient Athini or Kekropia. Even if not entirely peaceful, the unification – widely known as synoecism and assigned to the mythical hero Theseus who thus became the first king of the city state of Athens – was panegyrically celebrated in the Classical period with two major festivals, the Synoecia and the Panathenaea, which took place in the Agora.

The Mycenaean period is inextricably associated with a series of mythical kings, such as Cranaus, Erechtheus, Cecrops, Pandion, Ion, Aegeus, Codrus, and of course Theseus, whose lives nourished the Athenians' collective consciousness in historical times. But the city's prosperity was seriously affected during the collapse of Mycenaean civilization and the Dorian invasion at the end of the 2nd millennium BC. These tumultuous events brought about social changes that eventually led to the abolition of kingship. The Athenians took great pride in the fact that the Dorians never invaded the city, and it is from this period that the myth of autochthony stems. It was also at that time that Athenian refugees moved across to Ionia, in Asia Minor, in what would later be known as the first movement of colonization.

The descent of the Dorians (11th century BC) also marks the beginning of the Geometric period in Greek history, which lasted until the 8th century BC. Even though the period is often called the Dark Age of ancient Greece – mainly because of the general shortage of raw materials, the decline of trade, and the non-existence of writing – Athens steadily increased in size, new settlements were built, and its pottery with the famous geometric designs and the first sketchy outlines of the human body prepared the ground for subsequent artistic achievements.

In the course of the 7th century BC the increasing significance of craftsmanship and handicraft and the revival of trade put under scrutiny the unquestionable hegemony of the aristocracy of titles and land. There is evidence of a failed attempt of Cylon in 636 BC to exploit this general dissatisfaction in order to become a tyrant. Amid continuing struggle Draco codified the hitherto unwritten – mainly criminal – body of laws, but the unrest did not subside until Solon, a man trusted by all, reformed the state and the laws in 594 BC. His reforms aimed mainly at including the lowest body of Athenians in political decisions, and they are often now considered as the first step towards the realization of democracy, even if they did not manage to elicit general consent.

Encouraged by their newly established political rights, the farmers and cattle breeders kept pressing for an improvement in their position and in 561 BC one of their most able politicians, Pisistratus, took advantage of their unrest and support to set up a tyranny. In spite of his hegemonic spirit, he gave out agrarian loans, boosted trade with other tyrannical states in the Aegean area, and opened the city up to Ionian philosophical and artistic influences. Ancient sources assign to him the first recording of the Homeric epics and the establishment in 566 BC of the Panathenaea, a first major instance of collective religious worship. The tyrannical regime became oppressive during the years of Hippias, who was finally chased away in 510 BC. After two years of renewed political struggle Cleisthenes from the aristocratic family of the Alcmaeonidae enlarged the list of Athenian citizens, divided the population into ten tribes of mixed origins, and inaugurated the policy of ostracism – enabling the citizens to demand the removal from the city for ten years of any citizen they deemed too influential. The newly established Athenian democracy provoked Persia by supporting the Ionian Revolt and subsequently successfully resisted the Persian assaults at Marathon (490 BC) and Salamis (480 BC).

A more integrated form of democracy is associated with the rule of Ephialtes (who was assassinated by reactionary aristocrats in 461 BC) and Pericles. But Athens' leading role in Greek politics had been formally acknowledged already from 478 BC with the foundation of the Delian League, which brought all subject allies under Athenian control. Led by able politicians and generals such as Aristides, Cimon, and Pericles himself, Athens prospered for 50 years in political, artistic, philosophical, and financial spheres alike; suffice it here to remind ourselves of the Parthenon, the golden-ivory statue of Athena in it, and Athenian tragedy – all products of that famous *pentekontaetia* (50 years) brought to an end in 431 BC by the eruption of the Peloponnesian War, which was the result of Sparta's growing discontent in the face of an increasing Athenian expansionism in the

late 430s BC. Lasting 27 years, the unprecedented cruelty of this conflict with Sparta exhausted the city and at the same time let Persia into Greek internal affairs in 407 BC, when the former stepped into the war on the side of Sparta.

The antagonism between the two principal Greek cities continued over the course of the 4th century BC and Persia was once again called upon during the Corinthian War (395–386 BC), this time on the side of Athens. During the short revival of its independent status in the first half of the 4th century BC, Athens pursued an alliance with rising Thebes and made a series of failed attempts, including a second Athenian League, to restore its imperial role. The cultural life was still flourishing but the political prestige and the finances of the city were in steep decline. The emergence of Philip II of Macedon around the middle of the century and his appeal for a Panhellenic alliance that would campaign against the Persians were met with Athenian distrust and hostility, as Demosthenes' well-known and flagrantly rhetorical speeches against the Macedonian king testify. Athens' military power received a heavy blow from the Macedonian army at Chaeronea in 338 BC, but its leaders in the 330s and 320s BC, notably Eubulus and Lycurgus, carried on with policies of retrenchment that stripped the city of its last opportunities for a viable political role in the new order.

Under Cassander of Macedon, Demetrius of Phaleron ruled peacefully but tyrannically so that the arrival of the Antigonid ruler, Demetrius Poliorcetes in 307 BC was enthusiastically welcomed. In spite of the financial adversities that kept on driving the citizens away (mostly to the Asian courts whose armies employed them as mercenaries), Athens in the Hellenistic period established itself as a centre of culture and philosophy of international status. Epicurean and Stoic schools were now added to the Platonic Academy and the Aristotelian Lyceum, while the theatre and the arts thrived. Roman domination in 146 BC had no effect on Athens' intellectual and cultural prestige, which was to last throughout the years of Roman rule as well as the early Byzantine era up to the 5th century AD. The city enjoyed a new economic boom around 100 BC, related to privileges bestowed upon it by the Romans. But the Athenians' support of Mithridates VI in an effort to regain their freedom was severely punished by Sulla in 86 BC.

From the 50s BC Roman nobles and emperors with phil-hellenic attitudes – notably Hadrian, Herodes Atticus, and Gaius Antiochus Philopappus – became benefactors of the city. During the 1st century AD the altar to the Unknown God and the first Jewish synagogue were erected. The Gothic descent on Europe had its impact on Athens, which was devastated by an invasion of Heruli in AD 267 and of Alaric in AD 396. The city's demographic and financial decline – which had

already started by the end of the Peloponnesian War, when Athens is estimated to have had a population of around 36,000 people – was precipitated after the last destructions. At the same time, Christianity started making inroads. Already in the 3rd century AD celebrated Christian philosophers were teaching in new schools on the outskirts of the city.

Athos, Mount

Principal centre of Orthodox monasticism

Mount Athos is a peninsula in northern Greece, the most easterly of the three claws that Chalcidice extends into the Aegean Sea. From the isthmus in the northwest to the southeast point the distance is about 56 km, while that from coast to coast is rarely more than 8 km. About 6 km south of the isthmus a wall marks the frontier, and beyond it the ground rises steeply to wooded peaks of 500 and 600 m. South of Karyes, the capital, which stands more or less in the centre of the peninsula, the woods turn to scrub and eventually to bare rock as the contours rise, peaking finally at 2030 m before a sudden drop down to the sea. For more than a thousand years Athos has been the exclusive preserve of Orthodox monks; to this day it remains the principal centre of monasticism for all the Eastern Orthodox Churches. It is dedicated to the glorification of the Virgin Mary (or Theotokos), whose garden by tradition it is. She alone is held to represent her sex there, which is why Athos is closed to women.

In antiquity Athos was already a holy mountain, its peak being sacred to Zeus. In 492 BC the Persian fleet of Mardonius was dashed to pieces on the rocks at the southern point; mindful of this, the next time the Persians invaded Macedonia by sea, in 480 BC, they cut a canal through the isthmus to ensure the safe passage of their ships. Several cities were founded on the peninsula, and in the 4th century BC there was even a bizarre proposal to carve the mountain itself into the image of Alexander the Great; but the king told his architect to concentrate rather on designing the new city of Alexandria, and by the early centuries AD it seems that the place was deserted.

Atomism

One of the greatest contributions of ancient Greek philosophical *logos* to world civilization was the expression of a series of theories on the beginnings and structure of matter. Some were simple; others were more complex. Regardless of whether or not they were correct, they were a significant source of ideas and rationales that eventually played a role in the formation of modern scientific thought, even if they were incomprehensible to some.

The so-called atomic theory played a leading role. It consisted of a characteristic central idea that rejected the notion of an infinite divisibility of matter, as opposed to Aristotelian philosophy. The founder of the ancient theory of atomism is supposed to have been Mochus or Moschus, before the Trojan War. Leucippus, Democritus, and Epicurus, though not the introducers, described it and proved reasonably that atoms are the first principles of bodies. The views of Epicurus are considered by many to be the foundations on which many later Europeans formulated their own theories. As for Leucippus, whose historical existence has on occasion been disputed, we know that he was active in Miletus around the middle of the 5th century BC. According to Aristotle and Theophrastus, the title of his work was the *Great World System* (*Megas Diakosmos*). One of his students was Democritus, who was born in Abdera around 460 BC. All the original writings of Democritus are lost but excerpts of his work survive in later writers. Epicurus continued after Democritus.

The basis for adopting the existence of atoms is the acceptance of the existence of a vacuum, which is another distinction from Aristotelian philosophy. The existence of a vacuum, however, contradicts the theory of an infinite divisibility of matter. For this contradiction to be resolved, Leucippus' atom must be free of any vacuum and remain unchanged; a vacuum can exist only in the space between the atoms. Atoms are not born; they are indestructible, unchangeable, simple, and therefore eternal and with specific dimensions. They are not motionless but are in a state of a perpetual spin, which allows similar atoms to come closer together. According to Democritus, bodies are initially formed by the joining and binding of groups of atoms that eventually mould a world or worlds, since atomistic philosophers support the existence of infinite worlds. The perfect atoms move towards the peripheral and form a spherical celestial dome; heavier materials move towards the centre of the sphere and constitute the earth. Based on the atomic theory, Democritus tried to give a convincing interpretation of the subject of colours, maintaining that the four primary colours— white, black, red, and yellow—were the result of the different types and positions of the atoms inside the body.

From the ancient Greek theory of atomism, Newton mainly adopted

that of hardness when he expanded his atomic theory in the *Opticks* (Query 23). Many, however, consider that the scientist who brought the atomic theory into the public eye was Pierre Gassendi, who in 1649 published his comments on the 10th book of Diogenes Laertius and the *Syntagma Philosophiae Epicuri*, both of which contained a presentation of Epicurean and Democritean atomization.

Attalids

Ruling dynasty of the Hellenistic kingdom of Pergamum

The Attalids were the ruling family of the kingdom of Pergamum, which flourished under their control in the Hellenistic period from 281 to 133 BC. The dynasty was established by Philetaerus, a general in the army of Lysimachus, one of the successors of Alexander the Great. Lysimachus had gained control of Thrace and northwestern Asia Minor in the struggles after Alexander's death (323 BC), and he kept a large part of his state treasury in the city of Pergamum, which was under Philetaerus' command. In 281 BC Lysimachus was killed in battle, and Philetaerus laid claim both to Pergamum and to the treasury of 9000 talents. The 18 years of Philetaerus' rule (281–263 BC) were dedicated primarily to establishing and extending his control of northwestern Asia Minor and solidifying his family's position as the rulers of Pergamum.

In the early 3rd century BC Pergamum was a small Greek city built on top of a high acropolis whose walls enclosed houses, military barracks, storerooms, water cisterns, an agora (marketplace), and a

small temple built of andesite (the locally available stone) honouring Athena (patron deity of the city); near the lower reaches of the citadel, outside the walls, was a temple of Demeter. Food was supplied by farms in the surrounding plain of the fertile Caicus river valley. With his financial wealth, an easily defended acropolis, a fertile farming region, and reliable water sources, Philetaerus' main problem was protecting the outlying parts of Pergamum from the city's enemies. The most insistent of these were the marauding Gauls, a warlike tribe from central Europe that had crossed into Asia Minor in 278 BC and was harassing the cities and towns of northern and western Anatolia. While Philetaerus waged several successful battles against the Gauls between 278 and 276 BC, he often dealt with their threats of attack and plunder in the same manner as other local political leaders – by paying hefty tribute.

Philetaerus, who had no children of his own, adopted his nephew Eumenes, and named him his successor. Eumenes I (263–241 BC) was occupied in much the same manner as his uncle: he defended Pergamum against the more powerful Hellenistic kings, especially the Seleucids, extended the territory under his control, and continued the policy of pacifying the Gauls through payment of onerous tribute. Eumenes I was followed by his cousin Attalus I, who ruled from 241 to 197 BC. Attalus was an astute politician, a brilliant general, and a patron of education and the arts. It was during his reign that Pergamum began its transition from a hilltop fortress to a splendid Hellenistic metropolis. His first major act was to refuse to pay tribute to the ever-menacing Gauls. He led the Pergamene army against them, defeating them solidly. In honour of his achievement, the epithet “Soter” (Saviour) was added to his name, and he was the first of his family to be given the title “king”. The victory over the Gauls was followed by a number of military successes, often in alliance with an increasingly powerful Rome, and Pergamum's control and influence in Asia Minor were extended and strengthened.

Two of his sons followed Attalus I as king – Eumenes II (197–159 BC) and Attalus II (159–138 BC). Their reigns brought Pergamum to its zenith as a prominent political and cultural centre in the Hellenistic world. The city's population increased to more than 100,000 people, while the kingdom as a whole covered 172,880 sq km with a population of 5,500,000 comprising five classes of residents: citizens, foreign residents, soldiers, freedmen, and slaves. From the beginning, Pergamum had been governed by the constitution of a Greek city state, although the monarchy had exercised great authority in the political system. During the reign of Eumenes II the military alliance with Rome, which had contributed much to the growing strength of Pergamum, was temporarily broken and Eumenes led his army

unassisted in an important battle against the Gauls, who were waging frequent attacks on many of the cities in Asia Minor. This victory, won without the help of his powerful ally, substantially enhanced Eumenes' standing among neighbouring political leaders and greatly increased the power of the Pergamene monarchy.

Attalus II was an elderly man when he ascended the throne upon the death of Eumenes II. During his 21-year reign (159–138 BC) he continued the policies of his brother. He was a competent military leader and diplomat, continued the alliance with Rome, and was a patron of scholars and artists. Attalus II was succeeded by Attalus III, a son of Eumenes II, who ruled for only five years (138–133 BC). Upon his death this last Attalid king bequeathed Pergamum to Rome in his will. This act has never been clearly understood, but his decision may have been based on the knowledge that there was little chance that Pergamum could remain independent much longer. Rome had conquered mainland Greece, and devastated those who stood against it. Because of Attalus III, the citizens of Pergamum were neither plundered nor enslaved, but continued their lives in peace under the new regime. Pergamum became the capital of the Roman province of Asia in 129 BC.

The Attalids, especially from the time of Attalus I, saw themselves as the preservers of Classical civilization in the Hellenistic period. Since the political and military endeavours of Alexander the Great and his successors in the 4th century BC had moved the focus of the Greek world to Asia Minor and the Near East, resulting in the diminishment of mainland Greece, the goal of the dynasty was to make Pergamum the cultural and artistic successor of Athens. Along with the wealth of the original treasury of Lysimachus, the Attalids had a number of sources of income with which to implement their plan. Taxes were paid by the indigenous communities in the surrounding territory; tribute was paid by subject cities; and duties were assessed on items that were transported through territory under Attalid control. Pergamum also had great natural resources. Farms in the Caicus river valley produced wheat, barley, grapes, figs, olives, pomegranates, horses, pigs, cattle, and sheep. Mines and quarries supplied gold, zinc, copper, andesite, and marble. Pergamene factories produced wool, carpets, woven textiles, sewn garments, leather, perfumes, pottery, armour, and parchment. The great wealth of the kingdom by the 2nd century BC allowed Eumenes II to institute a major building programme that turned Pergamum into a magnificent city of marble monuments that was more than four times its original size.

Along with city planners and architects, Eumenes II welcomed artists and scholars. Pergamum had been known for its school of sculpture since the reign of Attalus I in the 3rd century BC when several

famous sculptors came to the city to create a multfigured group to commemorate the king's victory over the Gauls. The epitome of the Pergamene school, and of all Hellenistic sculpture, however, was the reliefs of the spectacular Pergamum Altar (now in the Berlin Staatliche Museen), a monument that honoured the Attalid dynasty, their military victories, and Pergamum's founding hero, Telephus. Dynastic support of a wide range of scholars, especially those connected to the schools of philosophy in Athens, had begun during the reigns of Eumenes I and Attalus I. Attalus' own teacher had been a Peripatetic philosopher from Athens, and his son Attalus II studied at the Academy in Athens. While Pergamum did not develop a professional school comparable to that at Alexandria, the scholarly environment created by the kings attracted a large number of well-respected philosophers, mathematicians, historians, biographers, geographers, astronomers, poets, playwrights, engineers, physicians, and scientists. The Attalids' support was not restricted to the professional class, however, but extended as well to a sophisticated secondary education system in which both boys and girls from Pergamum received instruction.

The scholarly climate was enhanced even further by the creation of the renowned Pergamene library during the reign of Eumenes II in the 2nd century BC. Second only to the library at Alexandria in antiquity, at its height it may have owned as many as 200,000 works. The most significant scholar in Pergamum in that period was Crates of Mallus, a Stoic philosopher, literary critic, grammarian, and geographer, who was also probably director of the library. He created a system of cosmogony in which the earth was round, and while he was not the first person to describe the earth as a sphere, he was the first to construct a three-dimensional geographical globe. Crates seems to have been influential in encouraging the production and export of fine-quality parchment, for which Pergamum became justly famous. The use of parchment not only eventually displaced papyrus as the main writing material in antiquity, but it facilitated the development of the paged book (codex), which had replaced rolled documents by the 4th century AD.

As the power of the Roman empire waned in the 3rd century AD, Pergamum declined in population and contracted in size. The city diminished in standing as a centre of political, commercial, and military activity. Except for the renovation of the temple of the Egyptian gods as a Christian basilica, it also played only a small role in ecclesiastical affairs. The sanctuary of Asclepius was abandoned, as were most other buildings in the plain and on the lower levels of the acropolis. By the late 3rd century AD the city consisted primarily of houses built over earlier structures on the fortified upper acropolis.

Pergamum did continue the Attalid tradition of being a centre of intellectual activity, however, playing a prominent role in the scholarship of the 4th century. It was home to the school of Aedesius (d. 355), a Neoplatonist who trained most of the famous teachers of philosophy in western Anatolia, including Maximus of Ephesus (d. 371), one of whose pupils was the future emperor Julian. Oribasius (d. 400), a companion of Julian and a native of Pergamum, was one of the most famous doctors and medical writers of the period; he was especially noted for his compilation of excerpts from the works of earlier Greek and Roman physicians.

While Pergamum continued to be occupied during the Byzantine period, it is little more than a shadow on the page of history. It was captured for brief periods by the Arabs in the 7th and 8th centuries, and refortified by the Byzantine emperors Constans II and Manuel Komnenos in the 7th and 12th centuries, respectively. It came under the authority of the Greek emperor of Nicaea, Theodore Laskaris, in 1214, then Turkish emirs gained control in 1302. By the end of the 14th century Pergamum had been nearly destroyed by invasion and sacking. In the Byzantine period ancient Greek manuscripts and knowledge of Classical culture were preserved in major centres of learning, such as Constantinople, Thessalonica, and southern Italy. How much influence came down to them from the scholarly environment created by the Attalids at Pergamum – through the disbursement of the library's holdings or through the students trained by teachers from Pergamum – remains unclear from the current state of knowledge.

Attica

Region of central Greece

Ancient Attica was made up the greater part of the modern nome of the same name. A three-sided peninsula which protrudes from central Greece, Attica is surrounded by sea on two sides with Cape Sunium and its famous temple of Poseidon at the southernmost tip. On the landward side Boeotia and Megara lie on the borders. In antiquity Attica covered over 2400 sq km and embraced a variety of mountain ranges and valleys as well as coastal and inland plains. The extent of the territory increased in specific periods, as the disputed areas fought over by Athens and Boeotia or Athens and Megara were added to Attica.

The Parnes mountain range separates Attica from its main northern rival, Boeotia. Here the competing poleis (or city states) fought over the upland plains and near the coast the important centre of Oropus. At the heart of Attica lies the Cephissus plain with the city of Athens at its centre. Enclosing the city and its plain are the mountain ranges of Hymettus on the east and Aegaleus on the west. Beyond Aegaleus stretches the Thriasian plain and the border with Megara. Eleusis lies at the southern edge of this plain. It looks across to the island of Salamis which was part of the Athenian polis in antiquity. To the northeast of Athens lie the Penteli mountains. Both Hymettus and Penteli provided the city with marble for building projects, most famously those on the Athenian Acropolis of the 5th century BC funded by the maritime empire. In southern Attica, the other major upland area, the Laurium hills were famous for silver and lead ores. The silver financed the construction of Athenian ships in the first quarter of the 5th century and continued to provide Athens with a large reserve of wealth on which it built its success. The natural resources of Attica, precious metal and marble, supplemented its agricultural assets, in particular olive oil, honey, and figs. These were the three most important cultivated crops of the region in antiquity.

Attica has been occupied since neolithic times. Evidence for human activity on the Acropolis dates back to about 3000 BC: pits and wells containing late neolithic pottery have been found near the Clepsydra spring on the north slopes. Wells and burials of the Early and Middle Helladic periods (3000–1500 BC) show signs of continued and expanding human settlement in Attica into the Late Bronze Age. In the Mycenaean period (Late Helladic: 1550–1100) the growth in the

number and quality of sites and the associated finds in Attica is remarkable. The end of the Mycenaean period sees a drop in the number of sites and quality of burial goods in Attica during the second half of 12th century BC. The Dark Age period, which covers the sub-Mycenaean to the end of the Protogeometric periods (1100–c.900 BC), is fast becoming a misnomer in the history of Attica. Iron technology spread quickly in this period, and was the dominant metal for swords, knives, axes, daggers, dress pins, and fibulae in the latter half of the 11th and the 10th centuries BC. The number of sites in Attica reaches a nadir in 1100 BC; but c.1050 BC there appears a new style of Attic pottery, the Protogeometric style, and a growing number of settlements on the east coast and inland become identifiable. This steady transformation of occupation after the sub-Mycenaean period is reflected in changes to burial practices; in addition, at the end of the 10th century, sanctuary offerings start to appear, examples of which are found at the Academy in Athens and on Mount Hymettus.

The Geometric period (c.900–700 BC) marks a rapid progression of developments in Attica. The number of known sites rises more than threefold between the 9th and the end of the 8th centuries. By 700 BC nearly half of the known Classical deme sites of Attica show signs of occupation. Despite the growth in evidence of monumental sanctuaries in the wider Greek world in the 8th and 7th centuries, Attica betrays fewer signs of such advances until later on. The 8th century is generally thought to be the time when Attica becomes a territory dominated by Athens; the widespread distribution of small settlements in the countryside is reflected by the large number of cemeteries found in the Attic countryside. These numbers fall in the 7th century and cult activity becomes the best indication of rural settlement. The 7th century is considered to be a time of revolutionary political changes in Attica: the mythical synoecism of Attica by Theseus may belong to the Geometric period or before, but the stories of family conflicts, the Cylonian conspiracy (c.630 BC), and the Solonian reforms of the early 6th century mark important periods in the history of Attica.

In the late 7th and 6th centuries political developments were centred on the control of power in Athens, and the reforms enacted there affected the whole of Attica. The unification of Attica as a political entity took place by the 7th century, and its subsequent history revolves around the relationship between the urban centre of Athens and its smaller, often rural communities. The power struggles of the 6th century, which present themselves as factional competition between groups, sometimes related by kinship ties, centre on regions within Attica (Herodotus, 1. 59). The experience of tyranny in Attica in the second half of the 6th century was not harsh. Many

developments focused on Athens, but settlements outside the urban centre were improved during this period of growing prosperity and peace: Eleusis was developed with an impressive circuit wall and the Telesterion (the hall of the mysteries) took on the square hypostyle design which existed at the end of antiquity; the early developments of the theatre at Thoricus belong to this period; the temple of Apollo on Cape Zoster at Vouliagmeni dates back to this time.

The fall of the Pisistratids and the reforms of Cleisthenes of 508/07 transformed the political organization of Attica and so shaped the subsequent structure of the region's history. The people of Attica were formally arranged by demes, small village-or town-sized communities. A number of demes were located in Athens, but the majority of the demes were extra-urban. These 139 demes were allocated to 30 regional groupings (*trittyes*). Attica was divided into three groups of ten *trittyes*: there were ten *trittyes* from the coastal areas, ten from the plain or inland area, and ten from the city area. The grouping of demes into these local enclaves allowed some manipulation of territorial control. One *trittys* from each of the three areas made up a tribe, and there were ten tribes. This political reorganization of Attica ensured that for much of antiquity the history of Athens could not be separated from the history of its surrounding rural territory.

The central role of demes formalized the political standing of rural settlements. The Cleisthenic reforms produced a system of political participation which involved the whole population of Attica in the running of the polis, even if the seat of power was located in the urban centre.

Attica in the Classical period flourished and became one of the most densely populated regions in Greece. Exploitation of the countryside increased rapidly, and the extent of farming and animal tending in the 4th century saw activity on even the most marginal of land.

The major cult centres of Attica at Rhamnous, Sunium, and Eleusis underwent intense construction work. New temples were also built at Acharnae and at Brauron. The insecurities created by the Peloponnesian War saw the construction of forts in Attica: Thoricus and Sunium were enclosed by defences, fortresses were built at Phyle and Panakton. The war had considerable impact on the Attic countryside. Pericles' defence of Athens during the Archidamian War (431–421) forced those living in the countryside to move into the city on a regular basis. The countryside was not abandoned completely, but there are signs of devastation: the Dema wall house is thought to have fallen into disuse during this period. The relatively brief summer invasions by the Spartan army during these years were less severe than the disruptions which the construction of a Spartan fort on Deceleia achieved between 413 and 403. The role of the harbour town

Piraeus and the strategic roles played by Eleusis, Sunium, and Rhamnous were crucial to the security of Attica. Their functions became more formalized by the end of the 4th century and were to remain so for at least the next three centuries.

The archaeological evidence for settlement and activity in Attica peaks in the 4th century: epigraphic evidence for the erection of decrees, funerary material, and religious dedications all climax in this period. The decline of evidence and signs of activity in the 3rd and 2nd centuries is thought to suggest that people withdrew from the countryside and migrated to the city. But the continuing success of Eleusis and Rhamnous throughout the Hellenistic period and the importance of the countryside as a source of food supplies suggest that Attica remained relatively well populated in the 3rd to 1st centuries BC. Clear signs of decline in activity focus on the Laurium mining region which had been heavily populated in the 5th and especially 4th centuries. The exploitation of silver by Athens in this area attracted large numbers of slaves, industry, and farming. The decline of mining in the first half of the 3rd century, and the small level of activity from the late 3rd century onwards, mark a stark contrast with the Classical period. The occupation of Attica in the 3rd and 2nd centuries should not be based on the exceptional patterns of activity seen in Laurium; Heracleides Creticus, writing in the late 3rd century, described Attica as a fertile region with a large number of inns and good road networks, all of which indicates some level of rural occupation.

The Hellenistic period may signify a decline in the intense exploitation of Attica; the real drop in activity belongs to the late Hellenistic and early Roman period in line with many other rural areas in Greece. The virtual disappearance of settlement and activity in and around Panakton in the previously disputed area between Boeotia and Attica from 200 BC to the late Roman period symbolizes the reduced pressure on the countryside in this period. The pattern of exploitation in marginal land in Attica is one way of calibrating the levels of activity in the area.

But the Roman period also sees an increasing revival in prosperity in other parts of Attica concentrated among a much smaller number of individuals. In the early 2nd century AD Herodes Atticus displayed his wealth in Athens but also developed Marathon as a personal estate. In contrast, some areas declined as the urban centre of Athens increasingly became the focus of expenditure: the Augustan period saw the removal of elements from the temple of Poseidon at Sunium into the rebuilt temple of Ares in the Agora at Athens.

In the late Roman period there is a brief intensification of activity in Attica, in line with general signs of revival in Athens. The Herulian sack of Athens in AD 267 and the subsequent decline of activity in

Attica mark the gradual drift of the region from the prosperity of the Greek and Roman periods.

B

Babrius

Writer of fables of the 1st or 2nd century AD

Babrius wrote verse fables, 144 of which are extant in their original metrical form. In addition, two proems (prefaces) remain, which seems to indicate that the fables were originally published in two books. The first proem is dedicated to one “boy Branchus”, the second to “king Alexander’s son”. These two addressees are probably one and the same person. It is, however, unclear with what historical king Alexander prince Branchus’ father is to be equated. We do possess external termini ante quem: since Babrius’ fables can be shown to have been well known by the early 3rd century AD, the author can safely be assumed to have lived in the 2nd or late 1st century AD; a still earlier date is excluded by the linguistic evidence. Quite unlike his predecessor Phaedrus (early 1st century AD), who was a Greek writing Latin fables, Babrius wrote in Greek, but was in all probability of Roman origin. This is indicated both by his very name, which occurs only in Latin and not in Greek inscriptions, and by a peculiarity of his metrical technique, accentuating each penultimate syllable, which is in accordance with Roman rather than with Greek prosody and stress. Babrius may have lived in the eastern (Greek-speaking) part of the Roman empire, more particularly in or near Syria. This is suggested by the literary and historically surprisingly exact ascription of the genre’s origin to the Syrians (i.e. Assyrians) in the second proem. Further clues may be found in the author’s professed personal experience with Arabs (57. 12), and in the oriental local colour of no. 8.

Babrius’ fables are written in so-called choliambic trimeters (iambic trimeters with a long penultimate syllable). In both proems he selfconfidently states that he has “softened” the stinging iambs, by which he may be taken to mean that he has innovatively tempered the originally satiric connotations of choliambic metre. The fables’ length varies considerably: on the one hand, the quatrain form is quite frequent, but the collection also includes a fable of 102 lines (no. 95). Many fables feature metrical epimythia, whose authenticity has sometimes unjustly been disputed. The collection has obviously been preserved incompletely, the alphabetic order in the principal manuscript abruptly ending with omicron.

The fables’ subject matter is partly traditional and partly original, including all kinds of variations as well as fabulizations of mythological and other materials. Babrius seems to have drawn from a

variety of sources. His narrative elaborations, psychological portrayal of protagonists, and mildly humorous tone are all stylistically idiosyncratic.

Babrius' fables enjoyed immediate popularity. A papyrus fragment dating from the early 3rd century AD (*Oxyrhynchus Papyri*, edited by B.P. Grenfell and A.S. Hunt, 1898–, 10. 1249) contains parts of four Babrius fables dealing with the theme of false judgement, which may be an indication that they were included in some sort of anthology used for moral education. That Babrius did soon become a school author is clear from various testimonies. First, the bilingual Graeco-Roman *Hermeneumata* ("Interpretations") by pseudo-Dositheus, which can be dated exactly to AD 207 and are explicitly composed "for lovers of Latin", contain 17 fables, 3 of which derive from Babrian prototypes. Second, 14 fables, 11 of which are in Babrian choliamb, have been preserved on the so-called Van Assendelft wax tablets (named after their Dutch buyer) from Palmyra (destroyed in AD 272); the many mistakes made in the Greek, as well as the very writing material, show that the fables served as a dictation given by a schoolmaster to a not-too-brilliant pupil. Third, we have a papyrus scrap (*Amherst Papyri*, edited by B.P. Grenfell and A.S. Hunt, 1900–, 2. 26; late 3rd or early 4th century AD) with fragments of three fables by Babrius, whose educational application is again clear from the accompanying Latin verbatim translation. Finally, another papyrus (*Bouriant Papyri*, 1; 4th century AD; edited by P. Collart, Paris: Champion, vol. 1), undoubtedly a Greek language teaching method, starting with monosyllabic words, ends with part of the first poem of Babrius' fable collection.

Babrius' fables also found more literate readers. In a Greek letter (*Epistle* 82; AD 362) the Roman emperor Julian explicitly quotes from a book containing fables by Babrius. In addition, Babrius' collection is the principal source for the 42 Latin fables in elegiac distichs by the Roman fabulist Avianus (c.AD 400), who pays tribute to his predecessor in the prose preface to his verse collection dedicated to the erudite Macrobius Ambrosius Theodosius, future praetorian prefect of Italy (AD 430).

The fables' popularity lasted throughout the Byzantine period. First of all, the *Suda* lexicon quotes more than 50 times from Babrius to exemplify particular words, and even lists the fabulist under a separate entry – in a way the Byzantine predecessor of this essay. John Georgides included many *epimythia* (concluding morals) from fables by Babrius in his *Gnomologium* (c.10th century). Two lexica (the so-called *Etymologicum Genuinum* and *Etymologicum Magnum*, dating from the 9th and 12th centuries respectively) exemplify two rare words (*omphax* and *pepromenon*) by quoting from two fables by Babrius. Two

other lexica (Photios and, again, the *Suda*) paraphrase a Babrian fable to illustrate the meaning of a proverb (*tn kheira*). One fable (no. 141) is only (if incompletely) preserved by two rather late testimonies, the Byzantine polyhistor John Tzetzes (12th century) and the neo-Latin Natalis Comes (16th century).

An important witness of the collection's popularity is the large number (148) of prose paraphrases of Babrian fables. Many of these (more than 50) give the outline of fables not preserved in their original metrical form. In addition, Babrius is the primary source of the Byzantine *Tetrastichs*, a collection of 89 fable quatrains in quasi-ancient iambic trimeters or typically Byzantine dodecasyllabic verses, ascribed to Ignatios (Diakonos?; 9th century). Their author(s) may have found inspiration in the frequency of four-liners among Babrius' fables mentioned above. The *Tetrastichs* were widely read in the Middle Ages, as is demonstrated by the great number of manuscripts, many of them falsely proclaiming Babrius as their author, and even misspelling his name as Babrias, Gabrias, or even worse. Their alleged Babrian authorship has been taken for granted more than once; even the famous French fabulist Jean de la Fontaine states that he has used Babrius, whereas it can be shown that he really read the *Tetrastichs*, and that in a Latin translation. Conversely, a scholium on Thucydides (4. 92) quotes as if from Aesop two verses by Babrius, whose proems admittedly do stereotypically mention the legendary fabulist as a source of inspiration.

Three Byzantine manuscripts containing fables by Babrius are extant: A, G, and V, named after the libraries in which they once were, or still are, kept, on Mount Athos, in Grottaferrata, and the Vatican, respectively. The principal manuscript A (now in the British Library, Add. 22087; 10th century) contains 122 fables, which are, like the prose paraphrases and the so-called Aesopic fables, alphabetically ordered by their incipit; the alphabetization of the second proem (under *m*, as it begins with *mythos*) makes it a priori unlikely that this order is the author's. G (now in the Pierpont Morgan Library, New York, Cod. 397; 10th century) has – in addition to an important version of the *Life of Aesop* – 31 fables, 4 of which are preserved only here; V (Cod. Vaticanus Gr. 777; 15th century) has 30 fables, 12 of which are not in A.

Modern times have seen the gradual publication of Babrius' collection. The fables from A and V, as well as the wax tablets, *Hermeneumata*, and prose paraphrases, were first published in the 19th century, whereas G and the papyri reappeared only in the 20th century. The rediscovery of the Athonite manuscript in 1842 by Minoides Mynas and its subsequent first edition (edited by J.F. Boissonade, Paris, 1844) were a first-rate scholarly sensation at the

time. The enthusiastic finder was inspired by his success to compose a series of fables in the manner of Babrius; his forgeries did mislead one editor (G.C. Lewis, London, 1846), but the pseudo-Babrius was soon unmasked as a jackdaw strutting with borrowed feathers. This curious little anecdote epitomizes a problematic implication of the fables' popularity. In view of the author's own complaint in his second proem that imitators "sneaked in when I first opened the door", those studying the many fables and paraphrases connected with his name should at least not rule out too easily the possibility that the accepted body of Babrius's work includes some forgeries.

Biography

Babrius lived in the 2nd or late 1st century AD, perhaps in Syria. He was probably of Roman origin but wrote verse fables in Greek, of which 144 survive in their metrical form. Prose paraphrases of more than 50 others survive. He remained popular throughout the Byzantine period.

Bacchylides

Lyric poet of the 5th century BC

Bacchylides, from Iulis on Ceos, was born around 510 BC and was active until the third quarter of the 5th century BC. A papyrus discovered in 1896 has preserved substantial remains of some 14 of his epinician odes (victory songs) and six dithyrambs (poems on heroic subjects). Bacchylides also composed hymns to the gods, paeans (hymns to Apollo), hyporchemes (songs for dancing), prosodia (processional songs), partheneia (songs for maidens), erotica (songs of love), and possibly enkomia (songs of praise), of which only fragments remain.

Little is known of his life. The poetic talents of the young Bacchylides probably developed under the influence of his uncle Simonides, who composed in a similar range of genres. Like many Greek poets before him, Bacchylides enjoyed the attention of a wealthy prince. Three of his surviving epinician odes are addressed to Hieron, tyrant of Syracuse, and the poet must have spent time in Sicily in the 470s BC. Ancient scholars believed that Bacchylides and his contemporary Pindar rivalled each other at Hieron's court for the favour of the powerful ruler. Bacchylides and his poems were also well received in many other parts of the Greek world. Among the addressees of his victory odes were athletes from Ceos, Aegina, Athens, Thessaly, Phlius, and Metapontum; and his surviving dithyrambs appear to have been performed in Athens, Delos, Delphi, and Sparta.

Bacchylides composed his victory odes for performance in the victor's home town after his return from the games, or, in the case of shorter hymns, to be performed at the athletic festivals. The odes were performed by choruses, which danced or processed while singing the odes to the accompaniment of the aulos and/or the lyre. The poems typically contain a mixture of praise, aphoristic statements, and myth. Since an ode usually records the name of the athlete, the specific contest won (chariot race, wrestling, etc.), and the location of the competition (Olympia, Delphi, etc.), it functions as an announcement and commemoration of the victory. Also included in the poet's praise are the victor's family and city of origin. Scattered gnomic statements, expressing proverbial wisdom or beliefs, enhance and temper the words of praise: "no mortal is blessed in all things" (5. 53–55), "fame follows him whom the gods honour" (5. 193–94). The third typical component of the odes, the often extended narration of heroic myth, serves several purposes. The inclusion of myths is a form of praise for the poems' addressees, as some association is implied between the achievements of the athletes and the exploits of the heroes. In poem

13, for example, the games at Nemea are understood to commemorate the struggle between Heracles and the Nemean lion. Recollections of specific mythic figures sometimes reflect the noble past of a victor's homeland. Poem 1, composed for a Cean victor, tells the story of Dexithea and her son, the Cean hero Euxantius. Myths of the heroic past may also illustrate principles and beliefs. Poem 3 relates the miraculous rescue of the semi-mythological king Croesus as evidence that the gods reward generosity and piety.

The dithyrambs, intended for choral performance at religious festivals and competitions, narrate scenes from heroic myth. Perhaps Bacchylides' most famous dithyramb, ode 17, tells how Theseus, while sailing to Crete with Minos and the contingent of captive Athenian youths and maidens, descended into the sea to the house of his father Poseidon and received gifts from Amphitrite. The poem characterizes the hero as a champion of the Athenians, opposing the aggression of Minos, and the affirmation that Theseus was the son of Poseidon may reflect the growth of Athenian naval power in the Aegean between and after the Persian Wars. The subjects of Bacchylides' other dithyrambs include the embassy of Menelaus and Odysseus to Troy, Heracles' celebration of the capture of Oechalia, the arrival of the young Theseus at Athens, Io's escape from Argus, and the marriage of Idas and Marpessa.

Bacchylides drew upon a range of previous poetry for his mythic material. Prominent among these sources were the early epic poets, from whom Bacchylides adopted legends about Heracles, Menelaus, and Meleager. He quotes one aphorism directly from Hesiod, and other maxims recall Theognis and Solon. It is reasonable to assume that, in regard to style and manner of presentation, Bacchylides was heavily indebted to his uncle Simonides, a pioneer in the development of the victory ode, but the scanty remains of Simonides allow little comparison. Bacchylides shares in common with Pindar the use of myth and maxim, and he seems occasionally to have imitated his older contemporary, but the styles of the two poets differ significantly. Pindar favours daring metaphor and dense imagery, while Bacchylides prefers simpler modes of expressions. Bacchylides also prefers clear, linear narration of myth, as was the practice in epic. His introduction of dialogue into his narration is reminiscent of Homer and was probably influenced by Stesichorus.

Bacchylides found no immediate successor, and the types of choral lyric he composed waned in popularity as the 5th century BC progressed, but his poetry was remembered long after his death. Alexandrian scholars counted Bacchylides among the nine great lyric poets. He is mentioned several times in the scholia of Homer, Hesiod, Pindar, and others. He found an admirer and imitator in the Roman

poet Horace. Quotations and references to Bacchylides in such authors as Longinus, Plutarch, Athenaeus, and Stobaeus attest to his enduring appeal, but the manuscript transmission seems to have been broken in the Roman period and his works were lost until the discovery of the papyrus in 1896.

MICHAEL J. ANDERSON

Biography

Born c.510 BC on Ceos, Bacchylides was active at least until 450 BC. He was the nephew of the poet Simonides and was no doubt influenced by him. In the 470s BC he spent time at the court of Hieron I, tyrant of Syracuse, where he may have been a rival of Pindar. Substantial fragments of poems in various genres survive, notably epinician odes and dithyrambs.

Bactria

Region of Central Asia

Annexed to the Persian empire by Cyrus II (Herodotus, 1. 153), probably in the 530s BC, Bactria was an important satrapy of the Achaemenids, bordering on the Oxus river in the north, the Pamir mountains in the northeast, and the Hindu Kush in the south. In 522/21 BC the satrap of Bactria, Dadarshish, supported Darius I against the rebellious Armenians and quashed the uprising of neighbouring Margiana. His successor was Artabanus, who probably was satrap between 500 BC and 465 BC. Bactrian infantry and cavalry, equipped with reed bows and short spears, fought under the command of Hystaspes, a brother of Xerxes, in the invasion of Greece in 480/79 BC (Herodotus, 7. 64). Together with the Medes and Saka, the Bactrian contingent wintered in Thessaly in 480/79 BC under the command of Mardonius. In consequence of a palace intrigue Xerxes' brother Masistes, the *hyparchos* (subordinate governor) of Bactria, planned a revolt against the king in Bactria, but was killed on his way there

(Herodotus, 9. 113). At the battle of Gaugamela Bactrian and Saka forces faced Alexander and his companions, marking them as the strongest force in the army of the Persian king. After his defeat Darius III tried to escape to Bactria, but he was killed by its satrap Bessus, who was also a relative of the king (Arrian, *Anabasis*, 3.21.5, 3. 30. 4). When Bessus assumed the Persian tiara and proclaimed himself king, Alexander immediately moved his army to Bactria to kill Bessus. The Bactrian capital Bactra, modern Balkh, was Alexander's residence in 329/28 BC before he continued his campaign against Sogdiana the following spring. Bactrian rebellion against Alexander in the summer of 329 BC lasted for two years, and when it was finally quashed, Alexander took 30,000 Bactrians and Sogdians as hostages.

Bactria was a wealthy province, profiting undoubtedly from trade between Persia and India, but also benefiting from fertile oases and pasturage. According to Herodotus (3. 92) Bactria paid an annual tribute of 360 talents of silver to the king of Persia. Reliefs at Persepolis show a Bactrian delegation bringing gold and camels as gifts to the king. The fact that several of Bactria's satraps were relatives of the king of Persia reflects the importance of this province for the Persian empire.

In the Seleucid period Bactria-Sogdiana formed a vast satrapy under one satrap, and was recognized as a wealthy province with valuable resources. In the 230s BC, led by the Greek Diodotus, Bactria revolted against the Seleucids and Diodotus proclaimed himself king. In 206 BC, after a two-year siege, Antiochus III was forced to recognize the Bactrian king Euthydemus. The Greek-Bactrian kingdom survived until 140 BC, when the Saka invaded Bactria, only to be expelled by a new power, the Tocharians, who invaded the country in AD 100.

Little evidence exists to elucidate the influence of Bactrian culture on the Greeks. While new foundations and extensive irrigation systems attest to the emergence of a growing Greek population in Bactria, the nature of the relationship between the local population and the new Greek-Bactrian rulers is difficult to establish. This uncertainty is illustrated by Ai Khanoum, a city of Greek foundation, complete with gymnasium and theatre, whose religious architecture, however, is distinctly oriental. Though Greek artists brought to Bactria much of the Greek style in art and architecture, they gradually assimilated new, local forms and styles. Bactrian Greek art was probably produced for the ruling elite, but must have existed alongside local traditions. Among the new species of plants introduced from Bactria to the Hellenistic world were the pistachio tree, which, according to Theophrastus, grew there (*Historia Plantarum*, 4. 4. 7).

Banking

Banking in Greece is, as M. Rostovtzeff remarks, "as ancient as the use of a coinage issued and guaranteed by the state". The earliest bankers (*trapezites*), the money-changers, sat behind their tables (*trapezai*) in the streets and marketplaces of ancient Greece ready to exchange coins of other cities. If the banking business is loosely defined as the storage of valuables and the lending of money at interest to borrowers, then the first primitive banks of Greece can be considered to be the temples. Since they were recipients of the offerings of the devout and because their sacrosanct character made them ordinarily safe from pillage, it is easy to see how this form of business began. Funds deposited in temples remained untouched and cash was lent from the temples' own funds to states, and also apparently – although the evidence is not certain – to individuals. The temple of the goddess Athena at Athens, for example, lent money to the state between 433 and 427 BC at 6 per cent. It must, however, be emphasized that the temples never operated a general banking business; that was left to private individuals.

The earliest mentioned banker in Greece for whom we have proper evidence is one Philostephanus of Corinth, who received a deposit of the considerable sum of 70 talents from Themistocles. In the 4th century BC we know the names of about 20 Athenian bankers. But banking in ancient Athens was a small private concern, never a great international system, organized and carried on in a modern way. The never-ending wars of ancient Greek cities and the great danger that pirates constituted to foreign trade made international banking

impossible. Even among towns in the same state there were no banking facilities. The cheque and the bill of exchange were unknown.

The banking operation in Athens, like nearly all other commercial activities, was performed mainly by metics (people not native to the city). For this reason, bankers were sometimes considered marginal to society. The most famous and wealthy ancient Greek banker was Pasion (d. 370/69 BC), a former slave. Although there were rich and famous bankers, yet money-lending and foreign exchange operations were, to a large extent, carried on by usurers. Interest rates of 30 per cent were not uncommon, especially for loans made to merchants and shipmasters for the furtherance of commercial ventures in overseas trade.

In addition to temples and individuals, some city banks existed (in the case of Athens the evidence is not strong). Miletus, for example, known for its financial strength, instead of having recourse to private bankers or temples for its money transactions, created a state bank. A further step was the establishment of a state bank monopoly.

The banking business, despite its local character and the absence of foreign operations, was relatively well developed in the ancient Greek city states, a characteristic that was later inherited by the banks of the Hellenistic world. One of the new principal features of that period was the rapid spread of city as well as temple banks, the best known of which were those of Cos, Ephesus, and Sardis. Although the evidence is not abundant, we know that temples in the Seleucid empire were highly respected at least in the early times of the dynasty. When, because of financial difficulties, some Seleucid emperors required the surrender of temple wealth, the action provoked a fierce reaction from the citizens because the bulk of the money consisted of private deposits.

The Ptolemaic banking system, on the other hand, assumed a peculiar and unique character. Its chief novelty was the centralization of banking by the creation of a state bank in Alexandria. Private banks played a secondary role in the economic life of Egypt. The Ptolemaic central bank was organized on a Greek pattern and in general was not very different from a regular city bank. Because the bank was an institution whose primary business was the custody and investment of the state's money and sometimes the collection of taxes, the interests of private clients were of secondary concern to it. Given the guarantees needed by the state bank to finance private ventures, individuals in need of money almost certainly had recourse to private banks. As a consequence of its good management, citizens preferred to deposit their money in it. The kings were not opposed to this extension of the activities of the bank as it meant an increase in their income and involved very little risk. In addition to these activities, the

bank had dealings in corn, since corn in Egypt was almost an equivalent of money. The government's granaries were effectively a network of corn banks with their centre in Alexandria. They were managed by a special staff, who had the same functions as the bankers; namely, they acted as intermediaries for either state or private corn transactions. The Ptolemaic banking system did not disappear with the rule of the Ptolemies. It was retained with some modifications by the Roman administrators of Egypt and it influenced the Roman and Byzantine system of tax and rent collection.

Beirut

City in Phoenicia

Archaeological evidence of occupation on the site of Beirut goes back to Neolithic times. The earliest mention of the name occurs in the Amarna letters (1377–1360 BC). After Alexander the Great had conquered the Near East, the city was Hellenized under the rule of the Ptolemaic and Seleucid dynasties. The Roman emperor Augustus settled veterans on the site, and around 14 BC Beirut (Latin Berytus) received the status of a Roman colony. Henceforth it was an island of Latin culture in the Greek Near East.

Beirut owed not a few of the monumental buildings that marked it as a Graeco-Roman city to the patronage of king Herod of Judaea and his descendants. The religion of Beirut had a Graeco-Roman superstructure built on Semitic foundations. Poseidon/Neptune, the principal deity, was probably a Hellenized version of Baal Markod. The patron goddess of the city, Aphrodite/Venus, who was worshipped in a temple of Roman design, was probably Astarte in Graeco-Roman guise.

Beirut was a trading city known for its silk and purple dyeing. Around AD 238 the school of Roman law is mentioned for the first time. Gregory Thaumaturgus, later to be a famous missionary bishop, was a student. In the 4th century many young men who were hoping to make a career in the imperial service or the courts enrolled to study Roman law. At the time the sophist Libanius was worried that the competition of professional studies in Latin and law would replace the traditional rhetorical education based on the study of Greek literature. In the end his fear proved groundless. The latest known public inscription from Beirut written in Latin dates from AD 344. In the 5th century Greek became the language of instruction at the law school. From the prefecture of Cyrus (AD 439–42) praetorian prefects issued their edicts in Greek. In the 5th and early 6th centuries some very well-known jurists taught at Beirut, two of them members of the commission set up by Justinian to compile the *Corpus Iuris Civilis*. With the publication of the Code legal education was restricted to the schools in Constantinople, Rome, and Beirut.

Biography and Autobiography

The genre of biography, if it can indeed be called a genre before the advent of the saint's *Life*, was one of extreme fluidity, some examples being categorized in antiquity rather under other genres such as the encomium and the funeral speech. The format too varied greatly: Satyrus' *Life of Euripides*, for instance, a work of the 3rd century BC, was even written as a dialogue. The term "biography" itself does not appear before the 5th century AD (in fragments of Damascius' *Life of Isidorus*), although *bios* (life) occurs for some varieties of biography from the 4th century BC, when it was even used collectively for Dicaearchus' cultural *Life of Greece*. The word "autobiography" is not ancient at all, but appears to have been coined by an anonymous English reviewer in 1797, and rejected by its author as pedantic.

The germ of biography is evident in the earliest Greek literature. In each of the Homeric epics an interest in the doings of individuals is signalled in the opening line. The *Iliad* deals centrally with the wrath of Achilles in his quarrel with Agamemnon and adds excursus on the prowess of a host of other noble warriors in preference to detailing the progress of a campaign; the *Odyssey* focuses on the adventures over a ten-year period of its eponymous hero. Personal revelations are made by Hesiod in his *Works and Days* and also, although there is much modern scholarly argument over their veracity, by the lyric poets of the Archaic age. An interest in genealogy too is attested towards the end of this period.

True biography and autobiography, however, began only in the 5th and 4th centuries BC. According to Momigliano, the first occurred largely in Greek Asia Minor, and he plausibly attributes it to eastern influence, and the second in mariners' accounts of their voyages, but the scanty evidence precludes any certainty in either case. From the beginning, however, as far as can be perceived, and throughout the history of surviving Classical and Byzantine biographical writing, one feature was consistently maintained: in the case especially of political and military figures, to a far greater extent than in the modern world, a distinction was drawn between histories containing biographical information and works centred upon an individual. The former generally restrict themselves to adult activities, detail the individual's publicly important actions, and strive for a high standard of truth; the latter include information on childhood, emphasize the personality, and often twist the strict truth for the sake of the work's overall purpose (the *loci classici* are Polybius, 10. 24 and Plutarch, *Life of Alexander*, 1. 2).

Commonly cited as the earliest of all Greek biographies, and dating from the first third of the 5th century BC, is *Matters Concerning Heraclides, King of Mylasa* by Scylax of Caryanda. However, only the title is preserved (and that only in a Byzantine compilation of the 10th century AD), there is no indication whatsoever of the nature of the work, and its attribution to this rather than the later Scylax of Halicarnassus or even to a third Scylax is open to question. Quotations direct and indirect from *On Themistocles, Thucydides and Pericles* by Stesimbrotus of Thasos (c.470–425 BC) clearly indicate a decided bibliographic interest, but even here the exact nature of the work is unclear. Possibly groundbreaking is the roughly contemporary prose *Epidemiai* by the poet Ion of Chios in which he describes, with obvious autobiographical elements, his visits to and impressions of notable men both political and literary (e.g. the tragedians Aeschylus and Sophocles), while fragments indicate that he mentioned philosophers too, including Socrates (without proving in this case any personal acquaintance).

In the earliest surviving Greek history Herodotus shows overt biographical interest in eastern rulers, whereas his Greeks generally appear as individuals more covertly through their actions, the latter a tendency even more pronounced in Thucydides. This may simply be explicable on the ground of familiarity to their audiences, but may reflect oriental practice in monarchies in contrast to the more communal emphasis in the Greek city states. The oldest surviving Greek works actually centred upon an individual date from the first half of the 4th century BC and take notably different forms. First there are “apologies” (legal defences), especially of Socrates, for whom both Plato and Xenophon initiated a series of ever more imaginary material which continued until the sophist Libanius’ declamation in the 4th century AD. Plato’s became increasingly regarded as the standard biography of the historical Socrates, while Xenophon supplemented his with a collection of reminiscences (*Memorabilia*) of the philosopher’s conversations, most, if not all, garnered from other sources. In imitation Isocrates, in 353 BC at the age of 82, after an unsuccessful law suit, felt compelled to write an imaginary forensic defence of his own life’s work (*Antidosis*). Demosthenes’ *De Corona*, on the other hand, is a real and spirited defence of the author’s political career delivered personally in court in 330 BC but dealing with the period before Athens’ submission to Macedon. Fully fledged encomia too appeared in the first half of the 5th century BC. Isocrates asserts in his *Evagoras* (king of Salamis in Cyprus who was assassinated in 374 BC) that he is the first to “praise a man’s virtues in prose”, presumably meaning in an extended single work. The dramatic, though fictional, setting is a funeral oration, which in a democracy was usually

reserved for citizens collectively lost in battle. His uncritical laudatory example was followed by Xenophon, whose *Agésilas* similarly describes its subject's actions and virtues, but may have been inspired by adverse criticism of the Spartan king (died 359 BC). Two further works of Xenophon demonstrate the extended range of biographical writing. The *Anabasis* vigorously and memorably describes his own role in leading home from Mesopotamia the Greek mercenaries after the battle of Cunaxa in 401 BC. The *Cyropaedia* is extraordinarily difficult to classify, since it deals only briefly with its ostensible subject (the education of Cyrus the Great), and is closer to a very lengthy dissertation on ideal kingship. It has been described as both a philosophical novel and the precursor of the love-romance. Moreover, whereas in the *Anabasis* historical veracity is occasionally subordinated to a self-advertisement necessitated by (lost) rival accounts, the *Cyropaedia* is so cavalier with truth as, among numerous flagrantly fictitious assertions, to have its hero die in bed rather than battle.

Aristotle encouraged a continuing Peripatetic biographical interest in other directions. The only surviving work is Theophrastus' *Characters*, a series of 30 sketches of unpleasant types of personality. His contemporary Clearchus of Soli attempted descriptions of different peoples. Others, not all Peripatetics, wrote on real individual figures (Theophrastus himself on Aristotle's nephew Callisthenes of Olynthus, a historian of Alexander the Great executed by the king) and especially philosophers. Aristoxenus' *Lives* were anecdotal and waspish; Antigonus of Carystus raised the subject to a higher level of scholarly accuracy in the mid-3rd century BC; and in the early 2nd century BC Sotion tried in his 13-book *Succession of the Philosophers* to establish an intellectual lineage from teacher to student, a serial form of philosophical biography best known today in Diogenes Laertius' work of the 3rd (?) century AD. Poets were not forgotten, and with older figures (beginning with Homer) ignorance was often not permitted to vitiate a full account: Chamaeleon, for instance, in the late 4th or early 3rd century BC, inferred biographical facts from the writers' own compositions, a practice that could lead to ludicrous inaccuracies and (a far more serious problem) to numerous suspect assertions not demonstrably false. Through a love of sensationalism, in the 3rd century BC Hermippus of Smyrna was deliberately fraudulent in his biographies of philosophers, poets, and lawgivers, of whom some were mythical.

Political biography from the Hellenistic period has also perished. Nevertheless, scattered fragments and allusions point to an increasing interest in individual rulers which was inspired by the charismatic career of Alexander the Great and continued under the numerous

subsequent monarchies. Some of these works naturally veered towards panegyric, such as *How Alexander was Brought Up* by the king's helmsman Onesicritus, who probably modelled his work on Xenophon's *Cyropaedia*. Adversely critical moral judgements, however, are suggested by monographs on types of public figures such as the Peripatetic Phaenias' *On the Tyrants of Sicily* and *The Slaying of Tyrants for Revenge*, Idomeneus' *On [Athenian] Demagogues* and Hermippus' *Lives of Those who Passed from Philosophy to Tyranny and Despotic Rule*. Nepos' surviving Latin biographies (including some of Greeks) from the 1st century AD, which have both an encomiastic and an ethical purpose, probably reflect a trend in most lost Hellenistic productions. Apologetic memoirs too by public figures continued, including the influential work of Aratus, the Sicyonian statesman of the 3rd century BC.

It is only from the imperial Roman age that true Greek biography and autobiography survive in substantial quantity, and even then not until the 1st and 2nd centuries AD. A largely new aspect of autobiographical works is their composition by intellectuals. Unfortunately only fragments remain of *On My Own Life and Education* by Nicolaus of Damascus, a Peripatetic aristocrat, tutor of the children of Mark Antony and adviser to Herod the Great (who wrote also a now fragmentary biography of Augustus which was based upon the emperor's own autobiography), but the Hellenized aristocratic Jewish priest Josephus saw fit to include intellectual matters in his surviving *Life*, which is chiefly intended as a defence of his command of Galilee during the first Jewish revolt (AD 66–70). The *To Himself (Meditations)* of the Roman emperor Marcus Aurelius, a unique work from antiquity consisting of very private self-exploratory musings on human existence whose subsequent publication is a complete mystery, also reflects (although it may not be categorized as a true autobiography) this trend, as does more clearly the physician Galen's philosophical *On My Own Opinions*. Notable later examples are the autobiography of the Antiochene rhetorician Libanius, written over nearly 20 years and in the form of a sophistic discourse, and most especially Synesius of Cyrene's *Dion*, in which he defends his attachment to Classical culture against both monkish asceticism and excessive pagan superstition.

Biographies of public figures reached their acme with Plutarch, whose *Parallel Lives* (in which he paired Greeks and Romans with usually a concluding comparison) was already an educational text by the early Byzantine period. Unlike many Greek biographies, they are of genuine literary merit and, despite some problems, real historical value; and they deal with the entire lives of their subject. Nevertheless, their primary aim was moral education through examples of virtuous and vicious behaviour. Their psychological

observations are on occasion subtly perceptive. Historical monographs (rather than true biographies), centred upon an individual and usually verging on the encomium, also continued to be written, such as Arrian's *Anabasis of Alexander* and the somewhat earlier second book of Maccabees (an epitome of a lost work by a certain Jason of Cyrene).

Biographies of philosophers are still to be found in the imperial age, but, in reflection of current literary interests, sophists replace poets. Modern knowledge of the Second Sophistic is largely dependent upon the 3rd-century *Lives of the Sophists* by Lucius Flavius Philostratus ("the Athenian"), a collection of brief and at times tendentious sketches. Diogenes Laertius' compendium of the lives and tenets of ancient philosophers, derived from similar earlier compilations, is a work of industry but little critical acumen and is chiefly valuable today for its quotation of three compositions by Epicurus. Generally more scholarly, though laudatory, biographies are those of the Neoplatonists Plotinus and Proclus by their pupils Porphyry and Marinus respectively, while biographies of Pythagoras by Porphyry and Iamblichus claim him as the source of Plato's philosophy.

In the imperial (and Byzantine) age, far more than before, contemporary rulers were subject to epideictic oratory, which contained many biographical details, albeit highly encomiastic and selective. The late 3rd-century rhetorician Menander, in laying down their formulaic contents, shows the types into which these addresses were divided: they included the encomiastic imperial oration and the address to local governors, speeches of welcome and valediction, speeches at weddings, birthdays, and funerals, the ambassador's speech, and many more. Most surviving examples are Byzantine, the emperor expecting one every year at Epiphany, and the ecumenical patriarch on Lazarus Saturday.

Biography of the Hellenistic and imperial ages had similarities with and probably influence on the anecdotal style of the synoptic gospels, a feature that persisted into the *Lives of martyrs and saints*. It is unclear to what extent the rise of Christianity or simply the common culture of late antiquity may have prompted the empress Julia Domna (d. 217) to bid Philostratus write a biography of the neo-Pythagorean holy man Apollonius of Tyana, a fictionalized amalgam of exotic travel, miracles, exorcisms, sage advice, religious asceticism, and non-conformity unique in pagan biography. At least it elicited a comparison between Apollonius and Jesus, which in turn provoked a refutation by Eusebius in the early 4th century. *Lives of Christian saints* most probably induced Eunapius to follow Philostratus in producing similar, though inferior and idealized, sketches of 4th-century pagan philosophers, rhetoricians, and iatrosophists.

Birth

Birth is a crucial feature of the life cycle. In the Greek cultural milieu, childbearing and family continuity are of paramount importance, with marriage and children considered to be life's highest attainment. The procreative purpose of female sexuality is emphasized, the role of the mother is glorified, and there is an apparent tendency to chide those who are either unable to achieve such a state within marriage or in some way rebel against it. The birth of a child is seen as ensuring the regeneration of life within the family and the community. It is regarded as a way of defeating death and securing personal immortality, since Greek children often bear their grandparents' names. In antiquity the Greeks were also dependent on their offspring for the perpetuity of their families (*oikoi*), for support in old age, and

for the tending of their tombs after death.

Until recently birth was primarily the concern of women. Its social history points to similarities in the experience and status of Greek women in all historical periods. The principal role of all Greek women was that of bearers and nurturers of legitimate children and, indeed, continuance of the race. Although we cannot speak of Greek women in antiquity as a unified group, legal and historical sources attest to the exclusion of women throughout Greece from the public domain, and to their devotion solely to reproduction. Indeed, even Spartan women – who were considered to be different and more visible than other Greek women in the public sphere because of their involvement in many athletic events – engaged in such activities with the main goal of bracing their bodies for delivering children for the city. Thus infertility in antiquity was viewed as a calamity; conversely, the birth of a child brought about a great change in the bride's position through full admission into the conjugal family, denied to her up to then.

Conception and childbirth were also seen as beneficial for female health and were prescribed as cures for a number of gynaecological conditions. Labour and delivery, however, could be difficult and in some cases could even lead to death. A high rate of both maternal and infant mortality is often assumed by researchers who report on the use of various herbal drinks, induced sneezing, or the tying of a pumice or a dead cyclamen root on a woman's thigh as a means of easing a difficult delivery. There was also a belief that delivery would be impeded if things were tied on or around the mother, for example, her hair or a belt. Because of the dangers involved in childbirth, women often invoked the help of certain deities who were believed to protect them on delivery, such as Artemis (Lochia), Athena, Eileithyia, and Genetyllis (in Attica).

Women gave birth at home with the assistance of female relatives and neighbours and/or a midwife. Male doctors were expected to assist only in cases of prolonged and hazardous labour. The role of the midwife was notable both in antiquity and in the recent past, and in some cases she shared the same status as a doctor. At birth it was the midwife who announced the sex of the child, cut and tied the umbilical cord, and judged its fitness to live. Yet, the expertise of the midwife was not limited to the process of delivery and to the birth itself. She was able to treat many female complaints that had to do with the uterus as well as postnatal problems, such as puerperal fever. In fact, a competent midwife possessed a wide knowledge of such diverse fields as dietetics, pharmacology, surgery (meaning the "work of hands"), and magic.

The use of a wet-nurse or dry-nurse was also common in Greek antiquity, but the mother was regarded as the infant's prime caretaker.

However, children belonged to their fathers, not to their mothers, and Greek law codes asserted that in the event of the father's death the newborn should be offered to its father's family. Male infants were favoured and the male foetus was believed to be more active than the female. Women who carried a male child were thought to be healthier with a better complexion, as well as having an easier pregnancy and delivery. Many ethnographic data refer to the use of figurines to increase fertility. Women who desired to have a child made an effigy of themselves as pregnant or an effigy of their prospective child as an adult and carried it as a talisman. Some researchers believe that the large number of female idols found in the Aegean and dating from the early Neolithic period may reveal an earlier preference for the birth of girls, since fertility was crucial for the survival of the group and pregnancy as well as maternity may even have granted special symbolic value to women. However, data on infanticide and the exposure of infants in Hellenistic Greece reveal that, if such a preference existed in early antiquity, it must have ceased later on because girls formed the group that was most highly at risk from such practices. Both infanticide and abortion were regarded as acceptable forms of family planning, with the former being preferable to the latter from the point of view of the mother's health.

Childbirth was considered unclean both in antiquity and in the present day, because it is coloured by natural, profane blood and thus ritually pollutes all those concerned, especially the mother. In antiquity the mother was considered impure until her postnatal bleeding had stopped. For that period of time contact with the sacred was avoided and women were excluded from the temples. A 40-day purification period was also followed by women after an abortion.

During the Byzantine era birth was institutionalized with the establishment of some lying-in hospitals, but the majority of women continued to give birth at home with the help of a midwife. Although evidence is lacking concerning the size of families and the frequency of births in this period, there was still a high rate of maternal and infant mortality. In this regard, A. Laiou estimates the net birth rate in the 14th century as 22 per 1000. Christianity, however, changed attitudes towards marriage and procreation, which were now viewed as subordinate to celibacy. At the same time the prestige of the woman as wife and mother grew due to her association with the greatest archetype of Christian cosmology, the Mother of God. The birth of boys was still favoured over that of girls since girls had to be endowed with dowries, and infertility was still a source of tremendous shame. In Byzantium many pre-Christian beliefs concerning childbearing persisted despite their condemnation by the Church. In the absence of medical expertise midwives often employed a mixture

of medical folklore practices and outright witchcraft to facilitate birth. Midwives were thus often associated with heretical beliefs and rituals. Women used various religious objects in order to gain divine assistance during delivery. The use of pagan amulets was also widespread, and was responsible for women commonly being accused of superstitious practices.

Bithynia

Region of northwest Asia Minor

Bordering the Sea of Marmara, the straits of the Bosphorus, and the southern shores of the Black Sea, and situated opposite Constantinople (Istanbul), Bithynia is today part of Turkey, and well known for its Byzantine fortifications and churches. Although originally confined to the peninsula of Chalcedon, it gradually extended eastwards to Heraclea and Paphlagonia and southwards across the Propontis to Mysian Olympus, a well-known Byzantine monastic centre during the iconoclastic period. Though mountainous and densely forested, it was one of the most prosperous regions of Asia Minor. Not only did it contain good pastureland, but it also produced fine timber and all kinds of fruits and grains. It was blessed with fine harbours, fertile valleys, and supplies of marble. The principal routes to the Anatolian plateau and to Pontus ran across it. However, its chief channel of communication was the Sangarius river which, with its tributaries, watered its fertile agricultural lands. As a corridor between Europe and inner Anatolia, Bithynia was situated in a strategic yet vulnerable position between east and west.

Bithynia was named after the Bithyni, one of the warlike Indo-European tribes that had emigrated from Thrace during the latter part of the 2nd millennium BC. In 560 BC the land was conquered by king Croesus of Lydia, but it fell into the hands of the Persians when the latter conquered Lydia four years later. However, foreign rule had very little effect on Bithynia, which retained its ethnic identity and survived into Hellenistic times under the rule of a local dynasty. It often waged war with the Greek colonies of the coast, and the warlike nature of its inhabitants saved it from complete domination by the Persians after the 6th century BC. It was occupied by Alexander the Great in 334 BC, although the warlike tribes did not fully submit to his conquest. After Alexander's death in 323 BC, Antigonos I ruled the land nominally for some time and founded Nicaea (modern Iznik), which subsequently became a prominent city of Bithynia. But the Bithynians regained their independence under Zipoetes in the early 3rd century BC. His son Nicomedes I established the first dynasty of Bithynian kings and ruled from 278 to 250 BC. In 264 BC he founded Nicomedia (modern Izmit) and made it his capital. He made an unsuccessful offer to pay the heavy public debt of the Cnidians in return for the *Venus of Praxiteles*. In order to protect themselves against the Seleucids and their rival Heraclea, the kings adopted a policy of both aggression and judicious alliance. As a result their power spread to inner Paphlagonia, to the fertile basins round Nicaea and Prusa, and eventually over the cities of the coast. Nicomedes invited into Anatolia as mercenary allies the warlike Celts who were subsequently settled in Galatia. This led to turbulent conditions in the land for many years thereafter. The country, however, prospered under his successors, stabilizing itself

internally while shifting alliances and waging wars with powerful neighbours such as Pergamum to which, however, it lost some territory during the 2nd century BC. These kings founded cities and promoted Greek culture.

The kingdom reached the height of its power in the early 2nd century BC, but this was followed by a century of rapid decline under incompetent leadership. Its notable rulers were Prusias I (237–192 BC), Prusias II (192–148 BC), Nicomedes II (142–91 BC), and Nicomedes III (91–74 BC). The last mentioned was a close ally of the Romans, being little more than a Roman puppet, and on his death he bequeathed his kingdom to Rome. This led to the Third Mithridatic War (74–63 BC) when Mithridates VI of Pontus tried without success to prevent the Romans from annexing Bithynia. During 65–63 BC Pompey organized Bithynia and Pontus into a single Roman province for purposes of administration. Its capital was Nicomedia which, nearly three centuries later, became the imperial seat of Diocletian. To facilitate the maintenance of order and the collection of taxes, Pompey divided the territory among 11 cities. Much of the land was split up into large estates, especially in the region of Nicaea. Although this area was heavily exploited by the Publicani (tax-farmers) during the 1st century BC, and in consequence much land was transferred to Italian owners, under the empire it became very prosperous. The rapid recovery of these cities from the ravages of war speaks well for Roman rule.

At first, the new province was governed by proconsuls. However, under the Julio-Claudian emperors imperial procurators assumed greater responsibilities owing to the importance of the highways to the eastern frontiers and Syria as well as the maritime connections with the Black Sea. Under Trajan and Hadrian the proconsuls were replaced by special imperial legates, and this agreement became permanent from the time of Marcus Aurelius. Pliny the Younger was sent as *propraetor* to Bithynia to restore the solvency of some cities there, particularly Nicaea and Nicomedia, which so rivalled one another in building as to risk bankruptcy. His correspondence with Trajan well reflects the conditions of Bithynian city life in the early 2nd century AD, while the speeches of Dio Cocceianus show symptoms of a booming but uncontrolled civic prosperity, as reflected in embezzlement by magistrates, lavish building programmes, bitter feuds between cities, and popular discontent.

Bithynia was the home of some well-known scientists and writers such as Hipparchus of Nicaea and Arrian of Nicomedia. It was also the temporary residence of the Latin authors Catullus and Suetonius, as well as the younger Pliny. Helena, the mother of the emperor Constantine, came from Bithynia. The *octophorus*, or eight-man litter, was particularly associated with the Bithynian kings. Bithynia became

a separate province in the early 4th century AD, and continued to exist into the 8th century when Slav captives were settled there.

Boeotia

Region of central Greece

The land of Boeotia is hemmed in by mountains on all sides. Along the Corinthian gulf the high mass of Mount Helicon and the lower pine-clad heights of Mount Cithaeron form the southern links in the great chain of mountains starting with Pindus in the north and continuing with Parnassus in Phocis. Parnassus in turn sends a spur eastwards to meet a spur of Cnemis, the two leaving only a gap of some 400 m for the course of the Cephissus river. This line forms the boundary between Boeotia and Phocis. From Oeta in Thessaly another chain advances until it meets Parnes, which stretches westwards towards Cithaeron, thereby separating Boeotia from Attica.

Within these mountains Boeotia lay split into two great basins, that of Orchomenus in the west and that of Thebes in the east, each of them quite distinct and separated from the other by the ridge of Onchestus. Copais, the largest lake in Greece for most of history, further served to divide Boeotia. Reaching from Mount Ptoos in the east to Helicon in the west, the lake left only a narrow ribbon of land to carry the road between Orchomenus and Thebes. Apart from the mountains Lake Copais, drained in the late 19th century, was the most conspicuous feature of the landscape, covering an area of some 360 sq. km.

The western basin of Boeotia is a patchwork of small plains and valleys separated from one another by bare, rugged hills, and watered by numerous springs and rivulets. The region was thickly settled, with Chaeronea, Lebadea, Coronea, and Haliartus each commanding the resources of level ground, and Orchomenus dominating the entire area. The eastern basin was marked by more and larger plains that supported numerous cities. The combination of good land and an ample, steady supply of water ensured prosperous farming. The openness of the terrain also permitted easy communication among cities. This region possessed the only good road to the sea. Its many

cities included Thisbe, Thespieae, Plataea, Acraephia, Tanagra, and Aulis. Within the basin the centrally located city of Thebes was predominant. From the outset of the Persian Wars until the *pax Romana* Boeotia was the “dancing floor of Ares”, the scene of countless battles, an epithet equally applicable to later ages.

Within the western basin the plain of Chaeronea, onto which ran the high road from northern Greece, formed the threshold to Boeotia. Commanding a fertile plain some 20 km in length and 3 km in breadth, the walled city of Chaeronea stood at the foot of the hills on the southern side of the plain. Its scanty remains include the theatre and the lion monument that marks the site of the battle there in 338 BC between Philip of Macedon and the Greeks. Sulla defeated the army of the Hellenistic king Mithridates there in 86 BC. From Chaeronea a main road led northeastwards to Orchomenus, the principal city of the western basin. The city stood at the southern foot of Mount Acontium immediately above Lake Copais. Connecting the city with its fortified citadel runs a long line of magnificent walls. Its most notable architectural remains include the tholos, or beehive tomb, and the remains of a palace, both of which testify to the greatness of Orchomenus during the Mycenaean period (c.1600–1250 BC). From the Classical period comes the newly found theatre, and from the Byzantine period dates the church of Koimesis tis Theotokou (the Falling Asleep of the Mother of God), built in the Bulgar architectural tradition. Orchomenus was also the site of the battle of Lake Copais in 1311, when soldiers of the Catalan Grand Company smashed the defenders of Frankish Greece.

South of Orchomenus lay Lebadea, overlooking a fertile plain that stretched from Mount Helicon to the Copaic basin. The city itself was always strategically significant owing to its location on the main road between the western and eastern basins. Its prominence in antiquity was due to the famous oracle of Trophonius, which functioned from the 6th century BC until the 3rd century AD. Lebadea flourished during the Middle Ages. The extant Frankish fortifications testify to its prosperity and military importance. During the 14th century it was fought over by the Catalans, Franks, and Navarrese, only to fall to the Turks in 1394. It was the second city in Greece from the time of the Turks until the War of Independence. Its magnificent 18th-century watchtower is still conspicuous evidence of its prominence. The route westwards from Lebadea to Thebes passed the valley of Coronea, at the entrance of which sat the city on a twin-peaked summit. Remains of the city are few, but in its neighbourhood stood the renowned sanctuaries of Itonian Athena and Athena Alalcomenae. Coronea was additionally important because of its communications up the Phalarus valley to a highland route over Mount Helicon. Its topographical

positron meant that Coronea was the scene of several major battles. At the eastward end of the road stood Haliartus, one of the strongest points between lake Copais and Mount Helicon. Situated on a low hill and surrounded by stout circuit-walls, Haliartus commanded a narrow pass that could not be outflanked, wherefore it too often became a battlefield. Haliartus possessed a small, but fertile, plain, and its low, fortified acropolis contained a temple and several other public buildings. Onchestus, to the east of Haliartus, occupied a low ridge between Copais and the Theban plain. Its significance was religious, political, and symbolic in nature. In the 6th century BC it was the seat of an amphictyonic league composed of several major Boeotian cities. There the Boeotians celebrated their unity by a common festival dedicated to Poseidon. Onchestus reached its acme in history as the political capital of the reestablished Boeotian Confederacy of the Hellenistic period.

East of Onchestus lay Thebes, the principal city of the eastern basin and the capital of Boeotia. It controlled the large, fruitful Aonian plain in the north, and lay near both the Asopus valley to the south and the Teneric plain to the west. Its rich and open land, combined with ample and constant supplies of water, nurtured a thriving agricultural economy. The acropolis of Thebes was the low plateau of Cadmea, which has been the primary seat of inhabitation from prehistory to today. Remains of the city, however, are few. Nonetheless, Thebes played a distinguished role in Greek affairs throughout history, and at one point in the 4th century BC it was the greatest power in Greece.

Emanating north of Thebes was a road leading to Acraephia of which little remains, and a much more important route passed to the northeast of Acraephia to Aulis and Chalcis. Aulis was the best harbour in Boeotia. It was the point where Agamemnon sacrificed Iphigeneia before sailing to Troy, and from it Hesiod sailed to Euboea. It was the chief harbour of Epaminondas' naval programme of 364 BC, and served as a port for two large Hellenistic fleets. Its most famous monument was the temple of Artemis and its adjacent buildings. Almost due east of Thebes is Tanagra, situated in the eastern part of the plain of the Asopus river. It is Homer's "Graia by the sea". Little is left of the city except for fragments of the circuit-wall and the foundations of a few buildings.

Plataea was located south of Thebes at the foot of the major passes over Mount Cithaeron from Megara and Attica. As the portal of southern Boeotia, Plataea was the perfect base from which to guard the passes. Though not large, its plain was capable of sustaining a city of ample size. Plataea was most famous for the decisive victory won there by the Greeks over the Persians in 479 BC. After the battle the Greeks erected the altar of Zeus Eleutherios (Zeus the Free).

Thereafter, it became insignificant apart from its Panhellenic festivals, which were still celebrated as late as the 3rd century AD. Southwest of Thebes in the eastern basin, Thespieae overlooked a small region of rich river valleys beneath low hills. It had access to the Corinthian Gulf by way of Creusis and farther west by Thisbe, both separated from Thespieae by mountains. Thespieae boasts only a few ruins, for in the 19th century French archaeologists destroyed much of its walls in search of inscriptions. It survived into the time of the Roman empire as a religious centre, owing to its Panhellenic festivals of Eros and the Muses.

Boeotia was prominent throughout history, but its grandest moments came during the Classical period. It survived the Persian Wars to emerge as a united people and government. In 447 BC it created a confederacy that introduced the first effective federal body in Greek history. Having helped to defeat Athens in the Peloponnesian War, Boeotia rose to ascendancy in Greece during the Theban hegemony. In the Hellenistic period Boeotia suffered decline, but rose again during the Roman empire. The Middle Ages saw the spread of Christianity through the region and economic prosperity that even innumerable wars never entirely destroyed.

Books and Readers

The two main pre-alphabetic scripts in use in the Bronze Age, Linear A (used c.1800–1450 BC in Minoan Crete) and Linear B (attested in Mycenaean inscriptions from the 13th century BC), seem to have been exclusively employed for administrative recording. Writing and reading were confined to professional scribes.

In the early 8th century BC the alphabetic script was adopted in the Greek world from the east (the first examples date from c.740 BC). The absence of writing for many centuries had encouraged the oral mode of literary production, which the Homeric epics seem to reflect. Although writing and communication with written messages were known, Archaic Greece was predominantly a society of oral traditions

(law, religion, history). Poetry (epic or lyric), whether orally composed or written down, was meant to be heard and was orally performed. Yet we hear of editions of the poems of Sappho and Alcaeus arranged in a certain order, and we assume that there were books of them owned by the performers and by the poets themselves, who appear to have known each other's work. From the 7th century BC papyrus was used for writing purposes, becoming the main writing material around 500 BC. The Greek word for "book" (*biblion*) means papyrus strip, thus suggesting the primacy of the papyrus roll as a book form. Other writing materials included leather, and Herodotus (5. 8) mentions that the Ionians used leather rolls. Books were scarce, afforded only by magistrates such as the tyrants Polycrates of Samos and Pisistratus of Athens, who are said to have owned collections of books (Athenaeus, 1. 3a).

The papyrus plant grew mainly in Lower Egypt, especially the Nile valley, and from a very early date it served writing purposes in Pharaonic Egypt. Its manufacture involved cutting the stem into short segments, slicing the white pith into thin strips, and placing them vertically parallel to each other; over this layer a second layer of strips was placed horizontally; the two layers were compressed so as to become one, and the sheet was then smoothed with a stone. Afterwards dried sheets were glued together to form a roll, usually 6–8 m long; rollers often protected the outer sheets. The scribes normally used for a writing surface the inside of the roll, where the fibres are horizontal, allowing the pen to run smoothly along them. The text was arranged in columns (*selides*) of varying height and length. The writing was in majuscule script without word division, punctuation, accents, or breathings. Titles, mostly later inventions, and authors' names usually came at the end of the roll. The lack of a law of copyright made forgeries common. Divisions into books largely reflect divisions into rolls and are artificial for all Greek writers before the 4th century BC. The reader held the roll with both hands, rolling up and unrolling so that the required portion of text was in front of him. Reading in antiquity amounted to reading aloud. It was difficult to make references or to quote with precision. Hence ancient readers usually quote from memory.

In the Classical period the use of books (i.e. rolls) became widespread, as the testimony of a number of Attic vases clearly shows. Intellectuals wrote down their treatises and published them by reading them aloud or having them read out (*ekdosis*) by a literate slave (*anagnostes*). Socrates in the *Phaedo* (97b–98b) says that he heard read a book of Anaxagoras and subsequently procured it to read it by himself. Protagoras also published his *On the Gods* by having it read aloud. There is evidence for an organized book market, and we learn

that Anaxagoras' works were available for a drachma (*Apology*, 26d). The plays of Aeschylus, Sophocles, and Euripides were also available in book form. Dionysus in the *Frogs* (52f.) reads Euripides' *Andromeda*, and Aristophanes' audience is able to consult books (*Frogs*, 1114). The dissemination of book culture in the 4th century BC made a teacher of writing and reading indispensable for the education of children (*Protagoras*, 325d–e). Although literacy levels varied, the habit of reading now became widespread, especially in higher social classes. Socrates praises a young man who spends money on books, and Aristotle was nicknamed “reader”, since he used to study his books in solitude. The earliest surviving papyri with Greek texts (Timotheos, *Persai*, and the Derveni Papyrus) date from the end of the 4th century BC.

Until the end of the Classical period there were only private collections of books, often owned by an erudite individual such as Speusippus, Aristotle, and Arcesilaus or by a private institution such as the Academy and the Lyceum. In the 3rd century BC public libraries were built by the Attalids and the Ptolemies, in Pergamum and in Alexandria respectively. In the Museum in Alexandria the foundations were now laid for the editing of Classical texts. Such scholars as Zenodotus, Aristophanes of Byzantium, and Aristarchus showed critical acumen in their editions of Homer, Hesiod, and the lyric and dramatic poets. They invented critical signs to indicate spurious verses and repetitions; they marked the metrical cola; and they devised aids to the reader (e.g. punctuation, change of speaker). Their work led to a general rise in the standards of book production. Division and arrangement of the contents into books were now employed by the authors themselves. Greek books circulated widely in the Roman world, featuring in private libraries of intellectuals such as Cicero and Atticus. The Bible was now translated into Greek for the Greek-speaking Jews.

Book culture flourished in late antiquity and most surviving papyri come from this period. The availability of books encouraged the making of anthologies, miscellanies, and encyclopedic works. Scholars such as Galen, Aulus Gellius, and later Origen and Eusebius, hired secretaries to help them in compiling their books. Parchment now became available as a more durable alternative to papyrus. But the appearance of the codex, the ancestor of the modern book, as an alternative book form was the most important event in book culture. A codex consists of a number of wide sheets folded vertically in half and then stitched together so that a single sheet forms two leaves. The earliest codices date from the late 2nd century AD. For some time rolls and codices coexisted (3rd–4th centuries AD), but soon the codex prevailed and became the usual book form. Initially there were

codices of both papyrus and parchment, but parchment soon became dominant. The establishment of the codex form was presumably due to its adoption by Christians. Early codices contained almost exclusively Christian texts. Systematic translation from rolls to codices took place in the 4th–5th centuries AD. The earliest extant codices are the famous Codex Sinaiticus and Codex Vaticanus of the Bible (4th century). Christians developed their own literature, and Christian centres of learning were established (Caesarea, Alexandria). Important collected editions appeared, such as Andronicus' edition of Aristotle, Thrasyllus' arrangement of Plato's dialogues, Porphyry's edition of Plotinus' treatises, and textbooks with selections of Classical authors for school use.

The codex was the usual book form in the Byzantine period, but the roll survived in the transmission of liturgical texts and in the imperial chancery. The dominant Christian culture affected book production. Prayer books, bibles, and psalters enjoyed the widest readership. The lower classes tended to read hagiographic literature, collections of patristic sayings, and popular stories (e.g. *Physiologus*), while the middle classes may have also read chronicles, history (e.g. the *Patria Constantinopolis*), and novels. Books of practical use, for example medicine, astrology, and of course school books, circulated widely. The Byzantine intellectual elite was largely preoccupied with Classical texts, thus ensuring their preservation for posterity. Ancient treatises were the models for the Byzantines – from science to literature. Books were expensive, and, at least until the introduction of paper, only the affluent could afford them. Shortages of writing materials account for the use of palimpsests, i.e. manuscripts where the original was erased and a new text written over it.

Botany

Ancient Greek literary writers often mentioned plant names, but without revealing whether these meant much to their audience. Theocritus and Sappho decorated their verses with pretty names of plants, and a famous fragment of a play by Eupolis has a chorus of goats declaiming a (very inaccurate) list of the plants that they were supposed to eat. There is nothing to show whether ancient Greek countryfolk had a profound knowledge of edible and medicinal wild plants.

Theophrastus (c.371–c.287 BC), colleague and successor of Aristotle, and the author of the *History of Plants* and *Explanations of Plants*, is regarded as the father of botany. He was a busy teacher at the Lyceum with many other interests, who probably had little time for botanical research. He seems to have known (at first or second hand) some 300 out of the 6000 species of wild plants that can today be found in modern Greece.

To judge by the *History of Plants*, Greek botanists were interested in five aspects of botany: (1) the structure and physiology of plants – for example, whether roots and shoots grow simultaneously; (2) the cultivation and propagation of field, orchard, and garden crops; (3) the occurrence and uses of wild trees; (4) drugs and medicinal herbs; (5) the occurrence of plants in particular localities.

On drug plants Theophrastus overlaps with the contemporary or earlier corpus of works associated with Hippocrates, later to be developed by Dioscorides and Galen, the great physicians of the early Roman empire. Herbs, gathered by professional herbalists, were evidently articles of commerce; Crete, with its many endemic species, was a special source.

Theophrastus does not stand alone: he mentions earlier botanists whose works do not survive. Many of his known successors were Roman rather than Greek. The technology of cultivation was taken up with greater success by Columella, Pliny the Elder, and Palladius Rutilius.

Ancient Greek botany laboured under many difficulties, beginning with that of identification and taxonomy. Botanists need to know which species of plant they are talking about. Writing a workable description of a plant, one from which someone else can recognize that plant, was a skill not far advanced in ancient times. Theophrastus mentioned brief points of difference between two or three similar species, but rarely, if ever, gave enough information to identify an unknown plant. Dioscorides attempted the systematic description of

plants; in an early Byzantine manuscript his descriptions are accompanied by illustrations copied from a lost work by Crateuas; fewer than half of these actually describe or depict a recognizable plant. Botanical illustration was a skill known to the ancient Greeks, but illustrations were not accurately reproduced until the invention of woodblock printing in the Middle Ages. Without the means of identifying plants and explaining that identification to others, the science of botany could not get far. The ancient physician often did not know what exactly he was prescribing for his patient.

Even worse was the ancient Greek vice of theorizing from small amounts of data. Although this led to some success in astronomy, it could not cope with the complexities and irregularities of plant life. *The Explanation of Plants* poses such vaguely physiological questions as “Why are not all plants more fragrant in hot countries?” Its “answers” lead into a morass of abstraction and generality, Aristotelian logic at its worst, having virtually no contact with actual plants. There is no sign of the patient collection, verification, and comparison of data from which real insights might have been gained; nor of the procedure of producing a theory from existing material and then seeking fresh data with which to test it.

Theophrastus collected information about tropical plants from remote parts of the world. But he valued information not for its own sake but in order to illustrate whatever theory he was writing about. Not much of a traveller, he relied on what others told him, and displayed little interest in verifying his data. He put into circulation some misinformation that is still current: for example, the notion that ivy destroys the tree on which it grows, which he could have disproved without leaving Athens.

However, he has some genuine insights into the behaviour of plants, noticing, for example, that firs like shade and pines like sun. At one point he attempted an ecological account of an actual place, the seasonal lake of Copais, with its unique reeds, and special craft of musical-instrument-making.

Evidence suggests that the ancient Hebrews and Romans were better botanists than the Greeks: much of Theophrastus’ material comes from Italy, where he had never been. This conclusion, however, depends on surviving writings, which are presumably only a small fraction of the literature that once there was. (In other fields, such as engineering and shipbuilding, the Greeks’ achievements were far greater than we would suspect from the written evidence.)

By way of the Romans, the Byzantine *Geoponika* of the 10th century AD, and the Arabs, Theophrastus’ legacy regarding cultivated plants was carried forward to initiate modern agricultural writing, in the form of the works of Alonso de Herrera in the 16th century. Ancient

herbalism continued into Byzantine times, as shown by the attention paid to Dioscurides and his illustrations. This is the source of the post-medieval western tradition of herbals, which developed into modern botany. It was also an impetus to the development of modern plant taxonomy, as early modern botanists visited Greece and other countries to try to identify and recover Dioscurides' drug plants. The herbalistic tradition continues in Greece to this day: *Votanothierapeutiki*, a herbal by I.K. Prinea and A.M. Sphakianaki published in Athens in 1980, is explicitly in the Dioscuridean tradition.

Bulgaria

Greek colonization of the Bulgarian coast, part of the region known in antiquity as Thrace, began in the 7th century BC with Miletus leading the way. The main sites were Apollonia (modern Sozopolis), Odrysos (modern Varna), Anchialos (Pomorie), Krounoi (Balchik), Naulochus (Ozbar), and Mesembria (Nesebar). These cities led an unexciting if prosperous existence, trading wine and salt in exchange for grain and livestock. Philip of Macedon conquered the interior of Bulgaria and founded Philippopolis (modern Plovdiv) in 342 BC. Only his more powerful successors kept control of this area, and only some stubborn campaigning in 28 and 29 BC by Marcus Licinius Crassus, son of the triumvir, brought the Roman frontier as far as the Danube. Thrace remained a client kingdom until the reign of the emperor Claudius (AD 41–54) when it was incorporated into the Roman empire. For the next 150 years the southeastern part of Europe prospered. More cities were founded in the interior, and it is clear from the evidence of inscriptions that Greek rather than Latin was the lingua franca in most of Bulgaria except for the Danube frontier. Ovid, although actually writing about Tomis in Romania, gives a fair picture of the hybrid culture of the Roman era, well preserved in Bulgarian archaeological museums.

Barbarian pressure on the Danube frontier began towards the end of the 2nd century AD in the reign of the emperor Marcus Aurelius (AD 161–80), although at the beginning of the century Trajan had

advanced Roman power across the Danube into Dacia. From AD 200 to 600 there was endless pressure on this frontier. Many barbarians passed into the Roman empire. On the other hand Greek influence spread to new cities of the interior such as Marcianopolis, Diocletianopolis, Nicopolis ad Istrum, and Nicopolis ad Nestum. A fair portrait of life in some of these cities and Greek cities on the coast is given by the 4th-century historian Ammianus Marcellinus and the author of the *Historia Augusta*. In the 6th century the western Balkans were devastated by barbarian invasion, but imperial armies were still active in Bulgarian territory in close proximity to Constantinople.

Bureaucracy

For most of antiquity, Greece remained a series of separate states, often in conflict. Hence, tracing patterns of bureaucracy is a difficult process at best. The Greek city states required administrative machinery to coordinate and produce documents, collect taxes, preside over laws, and maintain order. As a result, the development of a bureaucracy, or a core of professionals dedicated to the minutiae of state administration, became a requisite in nearly every state. City states developed similar patterns of administration. Increased efficiency, accompanied by advances in travel, produced government reforms on every level in almost every state. Greece was the first civilization effectively to develop a bureaucracy that incorporated those members of society who fulfilled the qualities of servitude and learning required to meet the needs of its citizens.

The duties of administration, responsibilities for the execution of those duties, and those permitted to function as part of the administration varied from state to state and period to period. Membership in many organizations was limited, by definition, to citizens. Affairs of the state and benefits that accompanied civil service were restricted to individuals belonging to a socially accepted group. Hereditary affiliation was the only means of inclusion within ancient Greek society. In some regions, however, slaves were employed for labour-intensive functions such as recording. Differences between the staffing of local governments were not important, however, since the benefits of government went to its citizens and to

no one else.

The establishment of a bureaucracy indicated the creation of an institution that outlived its specific function. Although they varied by time and location, ancient Greek society became dependent upon the services provided by civil servants. The bureaucratic framework relied on flexibility to meet evolving demands in a changing society. In its most basic sense, the bureaucracy facilitated distribution of obligations and benefits that accompanied citizenship. Through this distribution, Greek administrators promoted equity among the population and governmental advantage. The result of the Greek bureaucratic system was a society increasingly tied to local rule, and a general feeling of benevolence between government and citizen.

During the Archaic period public authority lacked direction and effectiveness. Evidence for this is found in Homer's *Odyssey*. City-state governments in this period failed to convene for decades. Citizenship indicated eligibility for public service, and, in return, society expected career terms of service from those elected. Other than the central composition of the government, usually a king, a council, and an assembly, little else is known about the daily functions of the government or its administration during the 8th century BC. With the limited number of persons involved in ruling a city state, there is likely to have been little interaction between ruler and subject, and little mutual concern.

Following the Archaic period, two events indicate the improbability of an established Greek bureaucracy. First, accounts of the Seven against Thebes suggest that the requisite conditions for a coalition – primarily an established bureaucracy – were missing. Second, Athenian intervention in the affairs of Miletus in 450 BC and Samos in 442 BC was limited to physical and not political domination. Athens lacked the required administrators to promote its policies and intentions. In both cases, Greece lacked the tools to capitalize on the success of its military campaigns.

Evolving through the ages of monarchy, aristocracy, and tyranny, three periods void of successful bureaucratic systems, democratic reforms in government produced similar changes in administration. Magistrates became crucial figures in most societies. Civil servants were elected annually and were not ordinarily eligible for reelection. Cities and states were administered by those professional civil servants who possessed no real power, but dedicated themselves to the execution of their duties. In any given city state, hundreds, even thousands of magistrates' positions existed, allowing a civil servant the opportunity to serve in several positions simultaneously without repeating a post assignment. Lower magistrates received a state-provided salary, while higher-ranking officials often came from

wealthy families, demanding no compensation. It was during the 2nd century BC that magistrates achieved prominence within Greek society, and a permanent, professional core of civil servants was established.

By the 3rd century BC Greek bureaucratic reform produced more widespread and tangible results. In Thrace king Seuthes III organized the country on a Hellenistic model. He divided his kingdom into towns, provinces, and regions. At the lower levels local rule provided direction for daily government functions, while a smaller percentage of natives participated at the higher levels. Each level took direction from higher authorities, while preserving the appearance of self-rule.

In Egypt Hellenistic rulers inherited a bureaucracy many centuries old. Different from the civil servants that perpetuated the daily activities of the Greek city state, Egyptian bureaucrats often performed their scribal or accounting duties for their entire lives. Scribes were often illiterate, transferring the symbols from one sheet to the next, failing to understand their significance. Accountants, who could perform basic arithmetic, were likewise illiterate, and ignorant of their greater significance within society. Trained to serve the pharaohs, Egyptian civil servants introduced a new standard of detail to administrative duties. The success of the Egyptian bureaucratic model prior to the Greeks is questionable, since few civil servants recognized their job significance or benefited from their selfless service. During the period of Greek rule an abundance of trained civil servants, both native and imported, permitted the division of Egypt into cantons, districts, and villages that could be extraordinarily well controlled. Traditionally, Greek civil servants filled higher posts in the empire than their native counterparts. Accountability throughout Egypt achieved unparalleled proportions during the 3rd century BC.

The Ptolemaic kingdom was the most effective political organization to emerge from the Greek-speaking world. The constitution of the empire provided the basis for unequalled administrative success. The Ptolemies oversaw the Macedonian-Greek upper class and the Egyptian fellahin, a group dedicated to the patient and meticulous work of serving the pharaohs. Rather than replace the Egyptian bureaucratic system, the first two Ptolemies opted to augment the existing system with Greek reforms. The combination of a disciplined workforce and efficient administration produced the most effective government of the ancient world. Reforms in government administration and accountability in Ptolemaic Egypt provided the standard by which bureaucracies would be measured for decades. It was also during the 3rd century BC that bureaucratic service became not only an acceptable profession for the upper class, but an enviable one.

During the 2nd century BC Greek bureaucratic reforms were

introduced throughout the eastern and western empires. Mithridates I emulated the Greek system, and employed Greek civil servants in large numbers. Iranian leadership instituted Greek reforms at the local level, and evidence of Greek bureaucratic influence appeared as far away as Kurdistan and India. The Greek model provided the basis for efficient administration of empires that continued to grow in size and complexity. By emphasizing self-rule, central governments freed themselves of the tedium associated with accounting and recording at the local level. The division of empires into subordinate organizations increased accountability and ensured the communication of supreme mandates.

Few changes occurred in Greek bureaucracy following antiquity. The Greek administrative model spread widely, appearing as the basis for the Roman system of administration, defining the Byzantine model of government, and finding great favour centuries later in the courts of Europe. Kingdoms in both east and west assimilated patterns of Greek government in their expanding and contracting empires.

Burial Practices

The earliest burials in Greece date from the Mesolithic period (8th millennium BC). In the cave of Franchthi (Argolid) were found the undisturbed inhumation of a young man and several disturbed burials, together with two cremations thought to be the earliest in Europe. There are many more instances of Neolithic burials (5th–4th millennia BC). The standard practice was primary inhumation in pits, though secondary inhumation (after the body had been exposed or provisionally buried until the flesh had disintegrated) and cremation are also attested. Formal cemeteries are first found in the Late Neolithic (Kephala on Keos), but are not common, or indeed large, before the Early Bronze Age (3rd millennium BC), in the Cyclades and Attica; from then on, the practice of burying the dead within the house is mainly restricted to children. Monumental tombs for multiple

burials (family, clan, or tribe) appear for the first time in the Early Bronze Age, but only in small numbers and certain areas (e.g. Leucas and Crete). Grave goods, which in the Neolithic were limited to simple pots, stone tools, or jewellery, become much more varied and reflect the socioeconomic differences in the community, the wealthy graves containing bronze weapons, clay and stone vases, gold and silver jewellery, and figurines of clay or marble. There is some evidence of ritual at the grave: vessels deposited on top of the grave, libations poured to the dead, and the ritual drink or “toasting” the dead, a custom better known from the Mycenaean period.

At the time of the first Minoan palaces (2000–1700 BC), the burial practices in Crete continue mostly unchanged, though jars (*pithoi*) or coffins (*larnakes*) were used more frequently. On the less prosperous mainland, burials were usually made within the settlements, in pits, stone cists, or in *pithoi*, and were scantily furnished with grave goods. Burying under tumuli, the only form of communal burial in this period, was an aristocratic practice, possibly restricted to particular tribes or clans, and largely confined to Messenia.

The Mycenaean period (1600–1100 BC) saw the change to the advice of multiple burial. Primary inhumation in family tombs became the norm. Single burials were uncommon and cremation an exception before the end of the period. The monumentality of the grave, the elaboration of the burial rites, and the quality and quantity of grave goods varied in relation to the status and wealth of the deceased in what was now a highly differentiated society. The earliest aristocratic cemeteries, Grave Circles A and B at Mycenae (1650–1550 BC), were circular stone enclosures, containing the graves of men, women, and children. The later, and richer, graves were deep shafts in which a number of dead were laid, and lavishly adorned with gold, including death masks for some of the men, headbands and shrouds decorated with gold discs for the women. Men were also provided with many weapons, and with drinking cups of precious metals, and women with gold jewellery. Later princely tombs were mostly of the tholos (beehive) type with corbelled vaults. The most monumental tholos tombs were built at Mycenae in the 14th and 13th centuries BC. Aristocratic funerals seem to have been lavish affairs, with funeral processions to the grave, the dead on horse-drawn chariots, the consumption of funeral meals, and the sacrifice of animals, sometimes even horses. Commoners were buried in larger cemeteries and simpler tombs dug in the rock, with a passage leading to a chamber (chamber tombs). Here multiple burials were often made over a period of several generations; earlier burials were pushed aside to make room for new burials after the flesh of the dead had disintegrated.

The so-called Dark Age (c.1200–700 BC) witnessed the reversion to

single inhumation, in pit- or cist-graves. This is now believed to have been the result of the depopulation and fragmentation of society which followed the destruction of the Mycenaean centres, rather than of the arrival of newcomers. Only in some regions (Crete and to a lesser extent Messenia and Thessaly) was multiple burial in chamber or tholos tombs retained. During the Protogeometric and early Geometric periods (1050–800 BC) Attica and a few other regions (especially Crete) adopted cremation to the exclusion of inhumation, particularly for adults, children being mostly inhumed. But in the 8th century inhumation made a full comeback in Athens, and for the rest of antiquity the two rites then coexisted, though there were differences from region to region and period to period, cremation being more common than inhumation for adults in the Archaic period (7th–6th centuries BC), inhumation more popular in the Hellenistic period (4th–1st centuries BC). The two practices were a matter of choice and not of status or wealth. Inhumation graves were normally single burials, in simple shafts or pits, sometimes lined with stones or covered with tiles, or in containers such as sarcophagi, clay tubs, or pots (particularly for children). Cremation burials were normally placed in urns of clay or metal, which were often placed in lidded stone boxes. The graves were surmounted by mounds (*tumuli*) and often by grave markers. In the Archaic period the mounds were large and the grave markers could be tall sculptured gravestones or even over-lifesized statues (*kouroi*). In the Classical period, the age of democracy, laws were passed at intervals to curb the ostentatious display of wealth and to control the expense of funerals, and so the mounds, judging certainly from representations on vases, were much smaller, while in Athens at least sculptured stone grave markers seem to have gone out of fashion for most of the 5th century. Family plots and *peribolos* (precint) tombs (tombs built of bricks or stones above the family plot) were used in Athens in the Classical period, but the grander type of built tomb was forbidden soon after its introduction in the late 5th century BC. Impressive examples of such tombs, with temple-like facades and sometimes vaulted and richly painted interiors, were built by the Macedonian kings and aristocracy from the 4th century BC onwards. They display a monumentality and wealth of grave goods (witness the unlooted tombs of Vergina) not found since the Mycenaean period.

The ancient Greek funeral as a three-staged process was already established by the time of Homer. The laying in state of the dead, or *prothesis*, most likely took place in the courtyard of the house after the ritual washing of the corpse by the women of the household. The dead was laid on a bier, wrapped in a shroud (or wedding dress in the case of unmarried or recently married women), the head supported by

pillows and adorned with a crown. An important part of the *prothesis* was the mourning and singing of dirges, both formal (*threnoi*), sung by professional mourners, and improvised (*gooi*), sung by friends and members of the family. During the *ekphora* the dead was taken to the place of burial, on a horse- or mule-drawn cart (though Geometric representations, in keeping with heroic ideals, show chariots), and accompanied by a procession of mourners and sometimes a pipe-player. Less is known about the third stage, or deposition: a libation of wine was made to the dead, grave goods (personal belongings: strigils, mirrors, jewel-lery, toys, or vases) were placed in the grave or in special offering places or ditches nearby. Ceremonies were held during which burnt remnants of food, including the bones of small animals or birds, were also deposited. After the funeral, a funerary banquet (*perideipnon*) in honour of the deceased was held in the deceased's house. In the days and weeks which followed, libations and offerings were made at the grave by relatives of the deceased, particularly the women. Special rituals were the *trita* (third-day rituals), *enata* (ninth-day), and *triakostia* (thirtieth-day). Subsequently rituals were held to mark the annual anniversary or special occasions.

Funerary customs did not substantially change during the Hellenistic and Roman periods, though the graves are generally poorly furnished (the most common offering is the fusiform *unguentarium*, a container for ointment). The spread of Christianity naturally had repercussions on funerary practices. One important change was the disappearance of cremation. During the Byzantine period the dead continued to be buried in single graves, though these were now usually located in graveyards adjacent to, or inside, churches and chapels. The graves themselves were cists made of stone or brick, and marked with a grave slab with a cross on it, or with an actual cross. However the earlier custom of including vases and other objects, and even the coin which had previously been intended for paying the ferry-man Charon, is found in Byzantine graves, and reflects the continuity of the pagan custom of providing for the passage from life to death.

Byzantium

City on the Bosphorus, later known as Constantinople and Istanbul

Byzantium was founded at the southern end of the European shore of the Bosphorus by Megarians, probably in association with other colonists from the Peloponnese and central Greece, in 668 or 659 ^{BC} according to respectively Herodotus (4. 144) and Eusebius (*Chronicle*). Its name is of Thracian origin, legend claiming the city’s founders to be Byzas, son of the nymph Semestre or a Thracian king, and a certain Antes. Like any other settlement along the Bosphorus and, to a lesser extent, the Hellespont (Dardanelles), Byzantium could potentially control maritime traffic from the Euxine (Black Sea) to the Aegean and the land route between Europe and Asia (Polybius (4. 38) details the city’s mercantile advantages). Its defensible position, however, was such that the earlier Megarian colony of Chalcedon (now Istanbul’s Asiatic suburb of Kadiköy) on the opposite shore of the Bosphorus came to be known as “The City of the Blind”. On a triangular peninsula bounded to the south by the Propontis (Sea of Marmara), to the east by the Bosphorus, and to the north by the Golden Horn (a 7.2 km inlet which could serve as a protectable natural harbour), the city had only two drawbacks, exposure to the European hinterland to the west and a lack of drinking water. Both these were remedied in later centuries by the construction of increasingly massive walls and a system of aqueducts and vast open and underground cisterns.

The colonists settled on the eastern tip of the peninsula, which sparse archaeological finds suggest had been occupied as early as the 2nd millenium ^{BC}. Apart from traces of shrines to Aphrodite, Apollo, and Artemis between the churches of Hagia Sophia and Hagia Eirene, superimposition of later buildings has precluded the discovery of the Greek city. According to literary sources, however, a north–south wall of about 2 km with 27 towers and several gates enclosed to the east military headquarters, an agora, temples, sanctuaries (most notably to Zeus, Poseidon, Athene, and Dionysus), cisterns, a gymnasium, and a theatre.

Little is known of Byzantium’s history until 512 ^{BC}, when the city

came under Persian rule. Except for the period of the Ionian Revolt (499–494), this persisted until 478 when the Spartan Pausanias expelled the occupying garrison, only to be himself recalled by his government for alleged treason. Thereupon Byzantium joined the Delian league, although, when the Persian threat had receded and Athens was treating the member states as its empire, Byzantium twice attempted revolt (440–439 and 411–408). Its annual contribution to the league of 15 talents indicates a wealth at this time which was derived mainly from tuna fishing, tolls imposed on shipping in the Bosphorus, and the resources of both European and Asiatic holdings. After the Battle of Aegospotami in 405 it came under Spartan control, but numismatic evidence proves that it joined the anti-Spartan sea league after the Battle of Cnidus in 394. Formally an ally of Athens from c.378, Byzantium revolted again in 357 in support of Rhodes, Cos, and Chios. Subsequently it came increasingly under Macedonian influence until, in alliance with Athens once more, it changed course and successfully held out against Philip II in 340–339 (to commemorate Hecate's succour at this famous siege the Byzantines put on their coinage her symbols of crescent moon and star, which were later adopted by the modern Turkish state). After the Battle of Chaeronea in 338 Byzantium came again under Macedonian sway, and in the 270s suffered severely from Galatian depredations.

In the following century its economic recovery was considerably aided by the privileged status granted to it as a reward for supporting the Romans during the Macedonian wars. This status was retained until Byzantium backed Pescennius Niger in his struggle for imperial power with Septimius Severus in AD 193–95. After a siege of two years, graphically and exaggeratedly described by Cassius Dio (75. 10–14), the Byzantines capitulated. Severus, however, rebuilt their devastated city, approximately doubling its area by constructing a new north–south wall about 800 m westward of its Greek predecessor from a point just east of the present Galata Bridge. Little of the layout of the Severan city is known, but a theatre and baths were built, the hippodrome commenced, and, probably, porticoes added around the agora from which a porticoed avenue led to the wall. (For the later history of the city, its topography, and monuments, see the entry on Constantinople.)

After an aborted attempt at building a new city in the Troad near the ancient Sigeum (at a location now known as Yenisehir) just south of the entrance to the Hellespont, Constantine I chose the site of Byzantium for his new and Christian capital. The city's perimeter was marked out on 8 November 324 and the dedication took place on 11 May 330. It is not certain what the emperor wished its name to be. Although it was most commonly referred to as Constantinople ("City

of Constantine”), the Latin poet Publius Optatianus Porphyrius used (in *Carminae*, 4. 6) the expression “New Rome” as early as 324/25 (Cassiodorus’ account of Constantine inscribing *Secunda Roma* on a marble column is, however, almost certainly legendary). Thereafter comparison with the ancient capital and rhetorical references to “New Rome” were increasingly favoured, but the earliest surviving attestation of this as an official name appears in Canon 3 of the First Council of Constantinople in 381.

C

Calabria

Region of southwest Italy

Calabria was colonized by the Greek city states from the 8th century BC. The south Italian colonies constituted “Greater Greece” or, as it is most commonly referred to, Magna Graecia. The establishment of Greek colonies in south Italy and Sicily was only the conclusion of a long period of contacts, from the end of the 2nd millennium BC, between the Greeks of the mainland and the islands, who were seeking new markets, and the indigenous people in Italy. The colonization was extremely successful, especially when compared with the trading settlements of the Phoenician and Carthaginian settlers, which lacked the permanent character of the Greek colonies. The expeditions were led by aristocratic families. There was close cooperation with the mother city, which provided active support for the colony. Rapid economic and cultural development therefore soon followed.

Sybaris, founded in the late 8th century, became exceptionally wealthy and was a byword for luxurious living, to such an extent that Athenaeus reports a belief that some of the inhabitants had wine-cellar near the seashore, into which wines were sent through pipes from their country estates. In 510 B.C. the city was destroyed by its rival Croton. In 444 B.C. on the initiative of Pericles Thurii was founded on the same site; the famous town-planner Hippodamus of Miletus designed the new city. One of the most famous Greek cities was Rhegium (modern Reggio di Calabria), an Ionian colony established by the Euboeans. Many philosophers were associated with the region of Magna Graecia and Calabria in particular, such as Pythagoras who emigrated from Samos to Croton, Timaeus in Locri, Parmenides and Zeno in Elea. The philosophical system of Pythagoras deeply influenced the cultural life of the colonies. Many of his ideas were enhanced by the Orphic cults that flourished in the area. Recent finds of gold coins with incised text found in tombs have increased our knowledge of the influence of the Orphic cult. Modern museums exhibit many traces of a glorious civilization and the archaeological sites are often breathtaking. Two of the most famous ancient statues, the Riace bronzes of approximately the 5th century BC, were found in a shipwreck in 1972, and are now exhibited in the museum of Reggio. Rhegium was important culturally. The sculptor Pythagoras, the poet Ibycus, and the historians Hippys and Glaucus were associated with it.

Locri was a colony established by Dorians from Locris. The poet Xenocrates was associated with Locri; he devised the “Locrian harmony”, a new type of musical composition that depended upon flutes rather than lyres. The Hellenistic female poet Nossis was also associated with Locri. She is known to us through some poems in the *Palatine Anthology*, and is believed to have written mainly epigrams in the sapphic metre. Ruins of an Ionic temple have been found near Locri, as well as a site associated with the cult of Persephone. Temples in the Ionic style are rare in Magna Graecia, where the Doric style prevails. A common feature of many cities in the area is the extramural sanctuary, such as the Heraion near Croton. Caulonia was a colony established by Locri that was destroyed in the wars between Pyrrhus and the Romans.

The region was conquered by the Romans by 212 BC and the cultural map changed significantly in the following centuries. Under Diocletian (AD 284–305) Calabria and Apulia formed one province, and until the 7th century the name Calabria designated all of southern Italy.

Calendar

Most ancient Greek states had their own individual calendars, often more than one for different purposes (e.g. civil and religious) as in many countries today (e.g. civil, religious, financial, scholastic). Like all calendars, the Greek suffered from the incommensurability of the units commonly used – solar day, synodic month, and tropical year. The solar day is the slightly variable period between successive

apparent passages of the sun around the earth, and was usually taken to commence at sunset. The synodic month is the substantially variable period of a single cycle of the moon's phases as seen from the earth, and was deemed to commence with the appearance of the crescent of the "new moon". The tropical year is the period between successive passages of the sun across the celestial equator in March (the vernal equinox), although the dates of its commencement were extremely varied. The week of seven days, possibly inspired by Babylonian hebdomadism, entered the Graeco-Roman world from the Jews only in the 1st century BC, at the end of which the practice of naming its days for the planets, as found in most European languages today, was already being established (the Hebrew numbering of the days, however, persisted in Greek).

All ancient Greek calendars were originally, and most remained largely, lunar. Months were named after festivals or deities and one was intercalated periodically to achieve approximate correspondence with the solar year. Most surviving calendaric information relates to Athens, which used an astronomically controlled lunar calendar; a festival or archon's lunar calendar (which through manipulation for political and religious reasons (mocked by Aristophanes in *Clouds*, 615–26) was often seriously at variance with the former); and a "prytany" calendar (used in dating governmental documents) which was based upon the annual presidential terms of the ten tribes in the *boule* (council). The years of the first two calendars were divided into 12 months of 29 or 30 days with a month being repeated when deemed necessary. The first day of each month was called the "new moon"; the next nine were numbered forwards as the "2nd to 10th of the waxing month", and the next nine simply as the "11th to 19th"; the 20th and 21st were called respectively the "20th" or the "earlier 10th" and the "10th of the waning month" or the "later 10th"; the 22nd to 28th were counted backwards as the "9th to 3rd of the waning month"; and the last day of the month was called "the old and the new", leaving the 29th in a 30-day month to be the "2nd of the waning month". Years were named after the eponymous archon (and in other states after other officials, priests, etc.). For the later numbering of years in a series, i.e. eras, see the article on Chronology.

Greek calendaric reform based upon cycles of years was made possible by the astronomical discoveries beginning in the 6th century BC with the sphericity of the earth, the obliquity of the ecliptic, etc. and, in the 4th century, by the theory of Eudoxus (which was refined by Callippus) of sun, moon, and planets moving in concentric spheres around the earth. Thus sometime before 432 the cycle of the *octaeteris* (cycle of eight years) was worked out by which the intercalation at intervals of three 30-day months during a period of eight lunar years

made the period roughly synchronous with eight tropical years. The famous reform of Meton and Euctemon at Athens in 432 (of which not all the details are known) devised a more accurate cycle of 19 tropical years and 125 30-day (“full”) and 110 29-day (“hollow”) months. Around 100 years later Callippus proposed a cycle of 76 years which is one day shorter than four of Meton’s cycles and thus accords more closely with astronomical phenomena. Later cycles of 2484 years (Aristarchus, who hypothesized heliocentricity) and 304 (Hipparchus) are also known, but, with the exception of the *octaeteris*, there has been much debate as to what extent any were used for civic as opposed to astronomical purposes.

In Greece itself states largely kept their own calendars into the early Roman period, some even persisting with the *octaeteris* until as late as c. AD 200. The conquests of Alexander, however, introduced over much of the eastern Hellenized world the Macedonian calendar of a year of 12 followed by a year of 13 lunar months, although this gave an excess of about seven days over a period of two solar years. The Greeks in Egypt, however, adopted the local calendar and the Seleucids adapted the Macedonian to the Babylonian.

Since by the mid-1st century BC the partly lunar Roman Republican calendar was substantially and increasingly out of phase with the seasons, Julius Caesar, in his capacity as Pontifex Maximus (chief priest), invited the Greek astronomer Sosigenes of Alexandria to advise on a new calendar, which was instituted in 46 BC and became known as the Julian calendar. Sosigenes first intercalated 67 days in addition to the regular biennial intercalation of 23 days (or 22 alternately in a quadrennial cycle) after 23 February, and then, to preclude a repetition of the Republican problem, proposed the adoption of a tropical (solar) year of 365.25 days. For practicality three years were to be of 365 days’ duration with an extra day intercalated (between 23 and 24 February) every fourth year. However, because of confusion caused by Roman inclusive reckoning this was done every third year until the situation was gradually righted under Augustus between 9 BC and AD 4, by which time the months had been given their present number of days. The revision of this calendar, known as the Gregorian calendar, appeared in a papal bull of Pope Gregory XIII in 1582. By it the first three centennial years in every sequence of four are not bissextile (leap) years, since the true length of the tropical year (365.242199 mean solar days) puts the Julian Calendar approximately seven days behind the seasons every 1000 years.

Callimachus c.320_{BC}–c.240_{BC}

Poet and scholar

Callimachus was one of the foremost literary scholars of the Hellenistic age and its most important poet. He produced an impressive array of works in prose and verse (the *Suda* ascribes more than 800 books to him, only a very small proportion of which has been preserved). Ingeniously taking up and reacting to earlier poetry, he became the very model of the *poeta doctus* for centuries to come.

Few details of Callimachus' life are known. He was born probably around 320_{BC} to a noble Cyrenean family. He may early on have had a position at the Ptolemaic court in Alexandria and could have attained his high standard of education at no better place than this. He spent long periods of his life in Alexandria and was intimately connected with its magnificent museum and royal library (both founded by Ptolemy I). Some other facts reported about him are probably fictitious: the *Suda's* statement that he was at first a lowly schoolteacher is probably the product of slanderous invention, and the evidence for his supposed feud with his (somewhat younger) contemporary Apollonius Rhodius is late and shaky (e.g. the identification of Apollonius with the target of Callimachus' curse-poem *Ibis*). Callimachus died probably around 240_{BC}.

Since dates for Callimachus' wide-ranging oeuvre are almost non-existent, it is best to present his work according to genre, following the order of the *Diegeseis* (summaries of his poems) preserved on papyrus (see below).

Callimachus' most famous poetic work is the *Aetia*, a collection of stories in four books relating the cause (*aition*, hence the title) and origin of certain peculiar customs and phenomena in the Greek world. Thanks to surviving papyri, this substantial work (possibly up to 6000 verses in elegiac couplets) can be reconstructed to a large extent. In the first two books (probably completed by 270_{BC}), the stories were framed by a conversation that Callimachus himself had (in a dream) with the Muses on Mount Helicon (a programmatic reminiscence of Hesiod). Books 3 and 4 were probably added considerably later (after

246 BC); they do not follow the narrative frame of the earlier books but consist of a collection of aetiological stories, the first and the last of which honoured Queen Berenice II, the wife of Ptolemy III Euergetes, thus providing a frame. At the beginning of book 3 the *Victoria Berenices* celebrates – in Pindaric fashion – the queen’s chariot victory at the Nemean Games and gives the tale of the games’ *aition*, Heracles’ slaying of the Nemean Lion, told from a typically Callimachean angle. On his way to the fight, the hero spends the night in the lowly dwelling of the poor peasant Molorcus; this domestic setting was probably much more developed than Heracles’ fight itself. Book 4 ends with the *Coma Berenices*, the tale of the lock of hair that the queen dedicated for the safe homecoming of Euergetes (who had gone to war in Syria); the lock vanished and was miraculously rediscovered in heaven as a new star (the charming story can still be read in Catullus’ Latin translation). Another famous story (in book 3) is that of Acontius and Cydippe, admired and imitated in Latin (by Virgil, Propertius, and Ovid) as well as in later Greek literature (e.g. in the *Letters* of “Aristaenetos”). The most important – and most widely quoted – part of the *Aetia* was the prologue, which (contrary to what earlier scholars have surmised) was already the introduction to its original two books. In it Callimachus vividly and vehemently rejects the carpings of the Telchines, as he calls his critics (the name originally signified some malevolent spirits), who demand from him heroic epics on a massive scale; but he cites the well-crafted small-scale poems of Mimnermus and Philittas as his models and claims that from his very beginnings as a poet Apollo himself advised him to seek out yet untrodden poetic paths.

The epilogue at the end of the *Aetia* evokes the next category of Callimachus’ poetry, the thematically and metrically very diverse *Iambi*, which adopt the tradition of the old Ionic iambus (and especially the work of Hipponax), as the *Aetia* took up Hesiodic catalogue poetry. In six of the *Iambi* (1–5 and 13) he adopted Hipponax’ trademark metre, the “limping iambic”; in the rest he used a variety of other metres. In *Iambus* 1 Hipponax himself speaks; he is “on holiday” from Hades and now admonishes – of all people – the scholars of Alexandria (Callimachus’ colleagues) to cease squabbling with each other; he then pointedly relates how magnanimously the Seven Sages behaved among themselves. *Iambus* 2 tells an Aesopian fable with satirical application at the end. *Iambus* 3 laments present bad times. *Iambus* 4, another fable about the contest between the laurel tree and the olive tree that is interrupted by a neighbouring bush, is apparently connected to the framing story, in which a quarrel between Callimachus and a rival is similarly interrupted by a third person. In *Iambus* 5, in metaphorical language, the poet advises a

pederastic schoolteacher not to pursue his vice any further. *Iambus* 6 offers a detailed (but badly preserved) description of the great statue of Olympian Zeus, apparently given by the poet to a friend who is about to visit Olympia; this is an intriguing mixture of a *propemptikon* (a farewell poem) and a traveller's guide. *Iambus* 7 gives an aetiological story about the wooden statue of Hermes Perphraeus (told by the statue itself). Of *Iambi* 8–11 only a few verses remain, but we know their content from the *Diegeseis*: a victory ode in iambic trimeters containing another aetiological tale (8), a conversation between a statue of Hermes with erect phallus and a pederast (9), an *aition* for a curious pig sacrifice to Aphrodite (10), and an *aition* for a proverb (11). *Iambus* 12 returns to more poetical spheres. In this birthday poem for the newborn daughter of a friend the poet related how, when a similar feast was once celebrated on Olympus for the newborn Hebe, Apollo's hymn was judged the best among the presents then given; surely Callimachus himself wanted his own birthday poem to be judged similarly. In *Iambus* 13 Callimachus defended himself against critics carping at the diversity and multiformity of his poems. This could have been a fitting conclusion to the collection; recently, though, it has been argued that the book of *Iambi* did not only contain the 13 poems described above, but also the four following miscellaneous poems in various lyrical metres, as the *Diegeseis* do not really distinguish them from the preceding *Iambi* (Cameron, 1995, pp. 163–70).

The *Hecale* is Callimachus' response to Greek epic tradition; in this epyllion (little epic) he chooses – as in the Heracles story in the *Victoria Berenices* – a characteristically unexpected angle to retell a deed by the young Athenian hero Theseus. Having just escaped an assassination attempt by the sorceress Medea, Theseus is forbidden by his father Aegeus to seek a new danger and slay the mighty bull that ravages the Marathonian countryside; he ventures out nevertheless and, when surprised by a heavy downpour, finds hospitable refuge in the hut of a poor old woman, Hecale (and Callimachus describes this domestic scene with loving detail). Next day Theseus successfully captures the bull (this, it seems was described only very briefly), but on his return finds the old woman dead; so he sacrifices the bull in her memory, and founds a new Attic deme, which he names Hecale, and a sanctuary to Zeus Hekaleios as well. The latter part of the poem is filled out mainly by the curious conversation between an old crow (which deeply delves into Athenian mythical history) and another bird (possibly an owl). The whole poem may have been 1000 to 1500 hexameters long.

The six *Hymns* to various deities, which take their cue from the so-called *Homeric Hymns*, are the only substantial part of Callimachus'

poetry (except the *Epigrams*) to be preserved in medieval manuscript tradition. *Hymns* 1 (*To Zeus*), 3 (*To Artemis*), and 4 (*To Delos*; the island is divinized as the birthplace of Apollo) are written in a straightforward fashion. *Hymn* 3 especially contains scenes pervaded by typically Callimachean humour: little Artemis reaches in vain for her father's bearded chin and pulls hairs from the shaggy breast of the Cyclops Brontes, and when – after a hunting foray – she is welcomed on Olympus by Heracles, this well-known lover of great quantities of meat earnestly tells her not to hunt little hares but bigger animals like boar and oxen! *Hymn* 4 wittily includes an honor-ific mention of Ptolemy Philadelphia by way of a curious prophecy (162–95): when Leto approaches the island of Cos, Apollo, speaking from her womb, forbids her to bear him there, for this island is destined to become the birthplace of another god (Philadelphus). The other three *Hymns* are set within the frame of a ritual which is evoked by the poet's very words. *Hymn* 5 (*To the Bath of Pallas*), which unlike the other hymns is written in elegiac couplets and Doric dialect, unfolds within a ritual bathing scene for a statue of Athena; within this frame another (mythical) bath of Athena is described which cost Tiresias (who had inadvertently stumbled on the scene) his eyesight for seeing the bathing goddess. *Hymn* 6 (*To Demeter*, again in Doric dialect) within its ritual frame tells how Demeter punished Erysichthon for destroying her sacred trees by striking him with eternal hunger (which is then described in lurid and ludicrous detail). *Hymn* 2 (*To Apollo*) evokes the epiphany of the golden, youthful Apollo and ends with a peculiar section leading us back to Callimachus' convictions regarding poetry (105–12): Phthonos (personified Envy) approaches Apollo and whispers into his ear that he does not love poets who do not produce works on the scale of the sea, but Apollo kicks him away and declares his own preference for the clear and pure water of the modest fountain to the mighty, but muddy, Assyrian stream.

Of Callimachus' *Epigrams* about 60 have survived, almost all of them in the *Anthologia Palatina*. In an age famous for gifted epigrammatists, these little poems (rarely exceeding six lines) still hold their own for the strength of feeling that they express and the unexpected tarn of thought that they often take.

Callimachus was as much a scholar as a poet, but of the astonishing amount of prose works he produced even more has been lost than of his poetry. According to the *Suda*, he wrote, among other things, *On the Names of the Months according to Peoples and Cities*, *The Settling of Islands and Cities and their Renaming*, *On Winds*, *On Birds*, *On the Rivers in the Inhabited World*, and *Collection of the Carvels of all the World according to Localities*. His greatest achievement as a scholar, however was surely' the *Pinakes*, or *Tables of Those who Distinguished Themselves*

in *All Kinds of Learning and of their Writings*, a gigantic catalogue (in 120 books) which presented the contents of the great royal library in Alexandria ordered by genre, author, and single works.

Both as a scholar and as a poet Callimachus had far-reaching influence. The great Alexandrian scholars Eratosthenes and Aristophanes of Byzantium were his pupils, as were a number of lesser ones (Hermippus of Smyrna, Istrus, and Philostephanus). In the realms of poetry, the *Aetia* and *Hecale* acquired immediate and lasting fame. The *Aetia* secured Callimachus a place among the foremost elegiac Greek poets; echoes from the *Hecale* can be found in many Greek as well as Roman poets. In Hellenistic times Callimachus' presence could be felt in the works of Apollonius Rhodius, Lycophron, Rhianus, Eratosthenes, Euphorion, Nicander, and Parthenius; in imperial times in that of Dionysius Periegetes, the two Oppians, Quintus of Smyrna, Triphiodorus, the Christian Gregory of Nazianzus, and Nonnus (both in the *Dionysiaca* and in the poetic paraphrase of St John's Gospel). In the little Egyptian village of Oxyrhynchus alone, papyrus fragments of nine separate copies of the *Hecale* have been found (ranging from the 2nd to the 6th or 7th centuries AD).

As Callimachus' poetry was never easy, even for native Greek-speakers, his works soon needed clarification. Perhaps as early as the final centuries BC the so-called *Diegeseis* (one might call them "Tales from Callimachus") were produced; largely preserved on papyrus, they provide valuable information on the content of Callimachus' work. Commentaries on Callimachus' poetry are known to have been written at least since the end of the 1st century BC: Theon, a scholar of Augustan times, and Epaphroditus (1st century AD) wrote commentaries on the *Aetia*; Archibius, the son of Apollonius, on the *Epigrams*; and Salustius (late antiquity) on the *Hecale* and perhaps other poems; this commentary was still used by Byzantine lexicographers (see below). Around AD 500 Marianus of Eleutheropolis produced a paraphrase of the *Hecale*, *Hymns*, *Aetia*, and *Epigrams* in 6810 iambic lines. The *Hecale* was cited by Archbishop Arethas (active in the late 9th/early 10th century), who also knew the *Aetia* and the *Hymns*; by the *Etymologicum Genuinum* (which, though itself lost, spawned various other *Etymologica* in the following centuries) in the 9th century and by the *Suda* (our most important source for the *Hecale* fragments apart from the papyri) in the 10th. The owner of the last known copy of *Hecale* (and probably *Aetia*) was Michael Choniates, metropolitan of Athens (1182–1204). This copy, however, in all likelihood perished when Athens was sacked by members of the Fourth Crusade in 1205. It was not until the 20th century that papyri would restore at least a part of what had been lost 700 years ago.

Biography

Born c.320 BC in Cyrene, Callimachus was probably educated in Alexandria and lived there for much of his life. He was closely connected with the Museum and the royal library. He wrote extensively in poetry (*Aetia*, *Iambi*, *Hymns*, *Epigrams*) and prose (most notably the *Pinakes*, a catalogue in 120 books of the library's collections). His pupils included Eratosthenes and Aristophanes of Byzantium. He died c.240 BC.

Canals

Until well into the 20th century difficulties of overland transport in Greece have led to a preference for water routes. A lack of navigable rivers has meant that long portages could not always be avoided, but Greece's deeply indented, irregular coastline has also provided opportunities to shorten both land and water passages through the construction of canals.

The most obvious site for a canal is at the isthmus of Corinth, which is a mere 6 km wide. A canal at this point was an objective of rulers from the 7th century BC to the modern era. The Cypselid dynasty,

which ruled Corinth from the mid-7th to the early 6th century BC, was credited by ancient sources with a number of major projects linked to water transport. The dynasty's founder Cypselus was said to have dug a canal which separated Leucas (a Corinthian colony) from the mainland, making it an island. His son, Periander, constructed the artificial harbour at Lechaëum, on the north side of the isthmus. Late sources claim that he intended to dig a canal, but had to settle for a slipway, called *diolkos* in Greek. Traces of this construction, consisting of a paved roadway and two channels, are still visible, and archaeological as well as literary evidence supports the conclusion that it was originally constructed in the late 7th or early 6th century BC. The original purpose of this slipway is not entirely clear. The *diolkos* is near to neither of Corinth's ports, and was probably used by ships who were simply in transit. All the explicit mentions of its use involve the transport of warships. Still, this is unlikely to have been the *diolkos*' principal function as envisaged by its Corinthian builders who, after all, controlled harbours on both sides of the isthmus. It has been suggested (Cook, 1979) that the objectives of the original builders were commercial. Use of the *diolkos* allowed the Corinthians to levy tolls on those who were not actually trading with them but were passing through Corinthian territory. This slipway remained usable at least into the period of the early Roman empire, and there is some evidence that it was continuously in use up until the 9th century AD.

A canal at the isthmus of Corinth was supposedly contemplated by a variety of Hellenistic and Roman luminaries. The Roman historian Suetonius gives an account of Nero attempting to encourage the praetorian guard in this endeavour by breaking the ground and carrying the first basket of earth himself. This was not merely one of Nero's extravagant but empty gestures, since trenches 1.5 to 2 km long dating to his reign were visible before digging for the modern canal began. This canal was finally completed in 1893 during the administration of the prime minister Charilaos Trikoupi. It was one of many public works projects aimed at modernizing the country's infrastructure. For ships which can pass through the canal, the voyage from the Aegean to the Ionian Sea is shortened by some 325 km.

The second famous canal in Greece was the work of the country's enemies. The assistance that Athens and Eretria lent to the Ionian Revolt attracted the negative attention of Darius, king of Persia, who sent an expedition ostensibly to discipline those two cities. However, the expedition never progressed further than Macedonia because of excessive casualties on land and a disaster at sea. Attempting to sail round the Athos peninsula, the fleet was caught in a gale; Herodotus claimed that about 300 ships and over 20,000 men were lost as a result. A second attempt by Darius resulted in the great Athenian

victory at Marathon. Herodotus presented Darius' successor Xerxes as eager to take revenge on the Greeks. He raised a force which dwarfed all the famous armies of the past and took extraordinary steps for the transport and provisioning of the expedition. In order to avoid a repeat of the Athos disaster he ordered that a canal be cut across the peninsula at its narrowest point, a distance of slightly more than 2 km. The project took three years to complete, and when finished the canal was the width of two triremes. Perhaps with the *diolkos* at Corinth in mind, Herodotus stated that Xerxes could easily have had the ships dragged across the narrow spit of land. He dismissed the canal as a work of ostentation, another manifestation of Xerxes' fatal hubris. Indeed, some ancient writers doubted that the canal had ever existed, or suggested that it had been only partially cut, with the ships being dragged the remainder of the distance. Nevertheless, European travellers of the 18th and 19th centuries noted traces of ditches and a chain of marshy lagoons along the line where the canal presumably ran. Recent geophysical investigations by the British School at Athens confirmed a V-shaped feature running along this line which agrees in its general dimensions with Herodotus' description (Isserlin et al., 1994). The question of whether the cut completely severed the peninsula, turning it into an island, remains unsettled. The character of the soil along the southern portion of the presumed course of the canal would have made excavation much more difficult. Cores taken from the fill of the canal have no marine indicators, perhaps evidence that it had no direct outlet to the sea or that it was open only for a short time. Herodotus states that as part of the canal-building project breakwaters were constructed to keep the canal from silting up. No traces of these breakwaters have been found and, if they were in existence only for a short time, the canal itself may have had only a brief useful life (Isserlin et al., 1996).

In post-Classical times Greek engineers had at their disposal more elaborate techniques for the building of artificial waterways. In the 3rd century BC Ptolemy II Philadelphia restored the Nile-Red Sea canal which had existed in the time of the pharaohs. Diodorus Siculus describes it as having a gate that could be opened and closed quickly, while Strabo mentions that boatmen could sail in and out easily. All of this suggests some kind of lock. Egyptian reliefs showing heavily laden ships voyaging between Egyptian Thebes and the land of Punt by way of the Red Sea attest to a much earlier canal which would also have been equipped with a lock (Moore, 1950, p. 99).

Roman military engineers assured the supply lines of the empire through a series of canals, dykes, and locks in the western European provinces. Pliny the Younger suggested to the emperor Trajan, while he was governor of Bithynia, that the construction of a canal between

the city of Nicomedia and a lake in the interior might be a worthwhile project. The canal was never constructed, but in the 6th century ^{AD} Justinian proposed an even more ambitious scheme to connect the Black Sea with the Propontis. This was to involve reversing the current in the Sangarius river, which flows northeast into the Black Sea, so that it would instead flow southwest into the lake. From there, a canal would be used to convey ships to Nicomedia. However, the only evidence that construction was even begun is the existence of an absurdly large bridge over the Melas river. This insignificant stream was supposed to receive the flow of the diverted Sangarius, but the plan was never accomplished (Moore, 1950, p. 108–09).

Cappadocia

Region of central Anatolia

Cappadocia’s southern border is the Taurus range of mountains. The Black Sea lies to the north, and its eastern boundary is set by Armenia and the Euphrates, with Lake Tata at its southern end. It consists of rugged plateau country, originally known for the breeding of horses, with limited agriculture, good grazing, and a fair degree of afforestation on the higher ground. The region is divided into a northern part, known as “Cappadocian Pontus”, or more often simply “Pontus”, and a southern part known as “Greater Cappadocia”, or simply “Cappadocia”.

Early in its history the region was invaded by Assyrians and Hittites (2nd millennium ^{BC}), followed by Phrygians and Cimmerians (c.1000 ^{BC}). The Persians, who came next (6th century ^{BC}), left their influence in art and religion. Although not directly conquered by Alexander the

Great, Cappadocia came under Macedonian control from the 4th century, as the native monarchy assimilated Hellenized patterns. This process was well advanced in the 2nd century BC, when kingdoms such as Cappadocia were forced to take sides for or against the Romans. A spell of vacillation ended in support for Rome. As a client kingdom Cappadocia gained a measure of protection, benefiting particularly from Pompey's restoration of order in the east. Annexation followed in AD 17, when Cappadocia was for a time combined with Galatia. Between 107 and 113, it was joined with Pontus to form a new province, an arrangement which lasted until the reign of Diocletian (284–305). The strategic importance of this frontier province was recognized by the building of roads and the stationing of garrisons. The area became one of large estates, including imperial ones, clearly worth defending. It contrived to resist complete absorption into Roman life, maintaining an identity which included a form of the Cappadocian language which survived into the 3rd century AD.

Immigration was also an important factor in the history of Cappadocia, whether of Jews and Celts in the Hellenistic period or of Armenians in the 6th century AD. The diaspora Jews of Cappadocia were a significant element in the history of the Christian Church, mentioned in Acts 2: 9 as present at Pentecost and again referred to in 1 Peter 1: 1 as a notable part of the Jewish community, amenable to conversion. Christianity was established early in Cappadocia and the region came to play a notable part in its development. Mazaka became the capital in the 2nd century BC, but was renamed Caesarea (modern Kayseri) in 12–9 BC and became the provincial capital in AD 17, serving not only as an administrative centre but as a focus of literature and learning. This cultural primacy was encouraged by the emergence of a notable bishopric. St Firmilian (d. 268) was an impressive occupant of the see who was on intimate terms with Origen and was able to invite the Alexandrian teacher to Caesarea. Cappadocia did not escape persecution, whether under Emperor Maximinus "the Thracian" (235–38) or Decius, in the years 249–51. Throughout all this, Cappadocia maintained a reputation for Christian orthodoxy, in contrast to the sundry heterodox movements that developed in neighbouring Phrygia.

It was, however, in the 4th century, following Constantine I's acceptance of Christianity, that Cappadocia achieved its most noteworthy Christian status, through the birth there and lifelong work of the so-called Cappadocian Fathers, Basil of Caesarea, Gregory of Nazianzus, and Gregory of Nyssa. Associated with them were Macrina, the sister of Basil and Gregory of Nyssa, Amphilocheius of Iconium, and Asterius of Nemesa. Cappadocia was also the birthplace of the emperor Julian, who came to be known as "the Apostate", for although brought up as a Christian he repudiated the faith and

attempted to restore paganism, to the great anger of Basil and Gregory of Nazianzus who had been fellow-students in his Christian days. The preservation of the Nicene faith and its definitive expression at the Council of Constantinople in 381 owes much to the relentless exertions of the Cappadocian Fathers.

Carneades 214/13–129/28^{BC}

Philosopher

A pupil of Hegesinus the Academic, Carneades became the classic exponent of the sceptical interpretation of Plato. According to this, the essence of Plato's thought was to be found, not in the positive teachings of the later dialogues, but in the diffidence of Socrates, who maintained that he knew nothing, pronounced most of his arguments inconclusive, and was willing in the *Phaedrus* to deliver successive speeches on the same question in opposing characters. Carneades, however, also made himself familiar with a more dogmatic system under the Stoic teacher Diogenes of Babylon, and many of his discussions (which were not committed to waiting but reported by his pupils) take the form of animadversions on Chrysippus, the most accomplished dialectician of that school. Indeed, he is reputed to have said that he would have been nothing without Chrysippus (Diogenes Laertius, *Lives of Philosophers*, 4. 62). Chrysippus averred that the wise

man has no opinions, since he is able to distinguish between impressions that are dubitable or false and those that are truly cognitive. Carneades, on the other hand, believed that by exposing the flaws in the arguments of his great Stoic predecessor he had proved the fallibility of all reasoning, and had thus shown that the wise man is bound either to have opinions or to think of nothing at all.

The most famous of his polemics were directed against the Stoic belief in providence. Chrysippus had urged that since the gods are wise they are bound to love us, and, since they know the future, cannot fail to speak in times of need through oracles and omens. Carneades turned this reasoning on its head by saying that, if it is true that a deity who is wise is bound to love us, the presence in the world of many evils that belie this love compels the impartial thinker to doubt either the existence or the wisdom of the gods (Cicero, *Nature of the Gods*, 3. 32). He was a strong proponent of free will, and is said to have attempted a tripartite classification of the possible goals of life. Against the Stoics who followed Chrysippus in upholding divination, he retorted that the evidence of the senses, unreliable though it is, is still more worthy of trust than the private arts by which the seers profess to detect an occult significance in nature (Cicero, *On Divination*, 2. 9). From the frequency with which his name is cited in polemics against astrology, it is probable that he is the source of many specific arguments espoused by the later, Pyrrhonist branch of scepticism; nevertheless his views can be distinguished from those of the Pyrrhonists in two respects at least. First, he did not acknowledge that his doctrine of universal fallibility was itself a thesis open to refutation; secondly, he did not assert that all fallible opinions were of equal weight, but held that we may have reasons for considering one more probable than another. The Carneadean sceptic therefore lives according to his own conclusions and not, as the Pyrrhonist has to do, according to the custom of his neighbours. Nevertheless the criteria that determined probability for Carneades are far from clear, and even his disciples found it hard in many cases to ascertain his own belief.

The most notorious episode of his life was his visit to Rome in 155 BC, when he joined the Peripatetic Critolaus and the Stoic Diogenes in a petition for the waiving of a fine that the Senate had imposed on Athens. To demonstrate his prowess in philosophy he spoke on one day before the Senate in support of a certain thesis and on the next with equal cogency against it. So impressive was this exhibition that the Senate at once acceded to Cato's motion for the settlement of the fine and the expulsion of the philosophers from the capital (Plutarch, *Cato Maior*, 22). Nevertheless, there is something not entirely foreign to the Roman spirit in scepticism. Cato himself is said to have thought that augury was a sham, and Cicero borrowed liberally from

Carneades in his works *On Divination* and *On Fate* which offer persuasive criticism of the Stoics. The third and ablest speaker in his dialogue *On the Nature of the Gods* declares that the Stoics have not convinced him, and that therefore he rests content with ancestral custom, the *mos maiorum*. This is the acquiescence of a Pyrrhonist, yet Cicero himself, in more Carneadean fashion, admits the force of the arguments on both sides, but opines without giving reasons that the Stoic enjoyed the best of the exchange. Carneades was for him the paradigmatic figure of the New Academy, of which he professed at times to be a member.

Under the Roman empire, systematic thought was once again in fashion among the Platonists, and Numenius of Apamea, a 2nd-century AD precursor of Plotinus, accused the New Academy of a progressive apostasy from the genuine teachings of the master. Around AD 200 the Christian writer Clement of Alexandria appealed to sceptical arguments to demonstrate the bankruptcy of philosophy, and deduced that no constructive thought was possible for those who were unwilling to put their faith in an infallible revelation (*Stromateis*, 5). The objections to astrology that were borrowed from Carneades by the Pyrrhonist Sextus Empiricus were borrowed in turn from Sextus by Hippolytus of Rome (died 235) and by Augustine. Nevertheless Augustine's work *Against the Academics* upholds dogmatic Platonism against the Carneadean method which assumes that it is possible to discover what is "like the truth" (*veri simile*) without the knowledge of anything that is certifiably true. The Christian tradition had good reason to treat the sceptic as its natural adversary, in the west as in the east: a Pyrrhonian suspension of belief could be the preface to orthodoxy, as in Descartes, but where the Carneadean spirit prevailed, as in Voltaire and Bayle, it allowed at most a lukewarm and conventional adherence to the Church.

MARK EDWARDS

Biography

Born in Cyrene in 214/13 BC, Carneades was a pupil of Hegesinus at the Academy and also of the Stoic Diogenes of Babylon. He became head of the Academy (or founder of the New Academy) before 155 BC. In that year he joined Diogenes and Critolaus on an embassy to Rome. He left no writings but his ideas were recorded by his pupil Clitomachus. He resigned in 137/36 and died in 129/28 BC.

Carthage

Phoenician city in north Africa

The traditional date for the founding of Carthage is 814 BC. In the *Aeneid* Virgil immortalized the foundation myth of Queen Dido fleeing the Phoenician city of Tyre, and the murderous designs of her brother, to the shores of north Africa where she established her 'New City' (*Kart-Hadasht*).

Carthage became a prosperous city governed by an oligarchy with two chief magistrates (*suffetes*) elected annually, and supported by a Council of 300 and a popular assembly advising them. This constitution was admired by Aristotle in his *Politics* (2. 8). It evolved later into the Court of the 104 Judges, and the Boards of Five. The ruling class used this system to block any ambitious *suffet* from becoming too powerful with the help of the army.

Soon the Phoenician seafarers of Carthage began to colonize Andalusia, Malta, Sardinia, and parts of Sicily. Phoenician tombs in these regions, dated between 800 and 700 BC, attest to this activity. The following centuries saw the further expansion of Carthaginian territory along the north African coast. One group among the leaders of Carthage favoured branching out into the interior where they occupied land in the Bagradas valley, and successfully practised agriculture among the Berbers. The majority of the leading men in Carthage, however, concentrated their activity on seafaring and trade. Carthage became the foremost among the Phoenician settlements along the coast of Africa, drawing revenues from their ports, which made it the wealthiest city in the western Mediterranean.

Eventually, Carthage's colonizing zeal and mercantile activities brought it into conflict with the peoples of the northern shores of the Mediterranean: first the Etruscans and Greeks, and later the Romans. In 535 BC Carthage in alliance with the Etruscans fought a victorious battle against Phocaeans at Alalia in Corsica and in 509 BC, as an established power in the western Mediterranean, it signed a treaty with Rome.

A Carthaginian army under the leadership of Hamilcar, possibly encouraged by Persia which was involved in conflict with the Greeks in the east, attacked Sicily in 480 BC. The invasion failed due mainly to an alliance between Syracuse and Acragas. Gelon (c.540–478 BC), the tyrant first of Gela and later of Syracuse, was a military leader of talent who had established his authority over more than half of

Sicilian territory. In league with Theron of Acragas (488–472 BC) and others, Gelon defeated the Carthaginians in 480 at Himera. Rich spoils in booty and prisoners were taken, and Gelon, mindful of Apollo, dedicated a golden tripod to the god at Delphi. Carthage was forced to buy peace, paying a large war indemnity.

The Greeks of Sicily were threatened again by Carthage when a Punic force captured Selinus and Himera in 409. In 405 Dionysius I (c.430–367 BC), the tyrant of Syracuse, acknowledged Carthaginian possessions in western Sicily where Himilco founded Lilybaeum, but was later able to drive them out of Sicily, leaving them by 392 in possession of the island's western extremity only. It was under his weaker son Dionysius II that Sicily was once again thrown into conflict.

In 348, 306, and again in 278 BC Carthage concluded further treaties with Rome. The last of these treaties had as its *raison d'être* in the danger posed to Carthage and Rome by the coming of Pyrrhus to Sicily. Regardless of this, the two states were later drawn into armed conflict, having both become entangled in Sicilian politics.

The First Punic War broke out in 264 and lasted until 241 BC. It was essentially a war triggered off by conflict of interest between Carthage and Rome; the former attempting to gain control over the Greek cities of Magna Graecia, and the latter seeing it as an interference in its sphere of influence. To recoup Carthage's losses resulting from the war, Hamilcar Barca abandoned all interest in Greek Sicily and established a Carthaginian empire in Spain. The capture of Saguntum by Hannibal in 219 BC provided the *casus belli* for the Second Punic War which saw Hannibal's spectacular crossing of the Alps into Italy and a string of impressive victories, but ended with Hannibal's defeat at the battle of Zama in Africa in 202 BC. In his statesmanship Hannibal belongs to the Hellenistic world of the Mediterranean, and in his generalship to the tradition of Alexander the Great and Pyrrhus, the Molossian king of Epirus (319–272 BC). After Zama Hannibal fled to the court of King Prusias I of Bithynia where he committed suicide in 183/82 BC. The Third Punic War was provoked by Rome's African ally Massinissa, and led to the destruction of Carthage by Scipio in 146 BC.

The territory of Carthage was pronounced cursed ground, and when Caius Gracchus tried to establish a Roman colony there, his enemies in the Roman Senate resisted, and he failed. It was later colonized by Caesar and Augustus, becoming the capital of proconsular Africa in the 2nd century AD. As such it was a flourishing Roman city, equally famous as a centre of education for orators and lawyers. Tertullian and Cyprian made it an important Christian city in the 3rd century AD; and in later years the bishop of Carthage was to play a significant role in Latin Christianity.

Cartography

In any consideration of cartography as practised by the Greeks, it quickly becomes apparent that there are two main divisions: the first is related to cosmology and theories about the origin and shape of the earth as a whole, while the second is rather more mundane and involves plans of a building, an area, a town, or a district, and may describe how to get from point A to point B, either by land or by sea. The ancients described these divisions as geography and chorography, respectively (cf. Ptolemy, *Geography*, 1. 1–5).

With regard to geography, early representations of the world survive from the Near East, the most famous perhaps being a clay tablet in the British Museum depicting Babylon and other districts and cities, along with the river Euphrates, all surrounded by a circular salt ocean with indications of mythical beasts and regions beyond the ocean. This object, dated c.600 BC, is surprisingly similar to the concept of the world promulgated by Thales of Miletus at about the same time, where the world is likened to an inverted bowl floating upon water: certainly the idea of the “River of Ocean” surrounding the land mass of the known world is remarkably persistent from Homer to late-Classical antiquity. As geographical knowledge improved, various writers recorded what they believed to be the spatial relationships of territories and peoples to each other, and it is from this information that many modern historical atlases present items such as “the world according to Hecataeus” or “Herodotus” or “Eratosthenes”: actual ancient versions of these maps do not survive (indeed, modern

versions seem to originate in the 1883 volumes of Bunbury), although there do exist Byzantine versions of Ptolemy's maps.

Circular maps were remarkably persistent, being found as late as the 1st century BC, even though Herodotus (4. 36) had mocked them in the 5th century. Of course, it is easy to confuse a circle with the representation of a sphere on a flat surface: the notion that the earth is spherical may have originated with Pythagoras and his followers in the late 6th century and certainly the idea was widely known by the 4th century, as can be seen from the production of "celestial spheres" (it is these, frequently with a zodiacal band, which appear in later statues of Atlas carrying a globe), all of which involved understanding of the equator, the tropics, and the polar zones, along with theories about inhabitable areas and the existence of "antipodes". Inevitably, people wanted to know exactly *where* they lived on this sphere and how *large* it was.

The gnomon (a vertical pointer, part of any sundial and possibly introduced from Babylon in the 6th century BC) made it possible to calculate latitude, if one knew the date and took one's readings at midday. Pytheas of Massalia (*fl.* c.320 BC) calculated the latitude of his home town to within about 13 km of the correct position; and from his famous voyage to the Tin Islands, around Britain, and possibly into the Baltic, he provided information about the length of solstitial days at various sites, which were later translated into degrees of latitude. (Longitude, of course, could not be calculated with any precision at all in antiquity, not that that prevented people from trying.) Eratosthenes of Cyrene (c.276–c.194 BC), chief librarian in Alexandria, was able, using a gnomon, to calculate that the distance from Alexandria to Syene (Aswan) was one fiftieth of the circumference of the earth, giving a result of 250,000 stades, which he later altered to 252,000 stades. There are several errors in Eratosthenes' calculations, notably that Syene lies on the Tropic of Cancer and that it is on the same meridian as Alexandria; however, these happen to cancel each other out and, depending on the length one accepts for a stade, his answer is either astonishingly close to the correct figure, or it is merely the best approximation arrived at in antiquity.

In a major work on geography Eratosthenes then proceeded to calculate the size of the *oikoumene*, the inhabited portion of the world, as known in the 3rd century BC, and to produce a detailed map of it, using lines of latitude and a number of meridians to produce a grid, within which countries were placed, each having a generalized indication of its overall shape. Our knowledge of this map comes from later sources and, although it was somewhat crude and modern reconstructions of it may be rather misleading, nonetheless it formed the basis of all subsequent attempts in antiquity to produce maps of

the inhabited world as they would be understood today.

By the middle of the 2nd century BC terrestrial globes were being produced, though large segments of them were inevitably hypothetical. Map makers tended, therefore, to focus on maps of the “known” world and they were, by this time, concerned with two problems: the representation of a section of a sphere on a flat surface and the type of scale to use. Crates of Mallus (who visited Rome c.168 BC) created a very large map which was 7 feet wide from east to west and intended to represent a scale of 1 foot to 10,000 stades; apparently the meridians did not converge. This map and others like it were clearly unsatisfactory; so the problem of establishing a suitable projection was tackled by Ptolemy (Claudius Ptolmiaeus, c.AD 90–168), who worked in Alexandria: he produced two projections, described in Book 1 of his *Geography*, and they constitute perhaps the greatest legacy from antiquity in scientific map making. In addition, the remaining seven books of the *Geography* catalogue by latitude and longitude about 8000 cities, mountains, islands, and the like, providing the raw material for the construction of a series of maps.

As for chorography, topographical representations have been identified in prehistoric carvings, and on rock and wall paintings and pottery, including an apparent “town plan” from Çatal Hüyük in Anatolia (c.6200 BC); and in Mesopotamia a seated statue of Gudea, ruler of Lagash in the mid-22nd century BC, shows on his lap a tablet bearing the plan of a large building with a scale along the top. In Egypt trigonometry and surveying instruments were developed in the early part of the Old Kingdom (c.2600 BC) to enable land allotments to be redefined after the annual inundation of the Nile; and many plans of estates, mines, and tombs survive from the period before 1000 BC. The Egyptian tradition of surveying and chorography became important for the rest of the Mediterranean world after the death of Alexander the Great, with the Ptolemaic dynasty and the scientific upsurge created by the Museum and Library in Alexandria. Alexander’s expedition across the Middle East as far as India created huge logistical problems involving supplies and reinforcements, and Alexander, pupil as he was of Aristotle and curious about everything, had surveyors (“bematists”) and geographers in his train. The result was an expansion of earlier Persian “route maps” and other representations of the world (cf. the story of Cleomenes I of Sparta and his discovery, from a map, that to travel the Royal Road from Sardis to Susa involved a march of three months: Herodotus, 5. 49–50), while Ptolemaic surveys in Egypt both of agricultural land and of distances undoubtedly influenced developments in Carthage and in Italy, where the Greek cities of the south and then the Romans evolved elaborate systems of land surveying and allocation

(centuriation). The building of highways throughout the growing empire produced what today are known as “strip maps”, culminating in the ancestor of the famous Tabula Peutingeriana and in various Itineraries, which reflect major routes for land travel in the Roman empire and later.

Although these developments involved Greek-speaking lands, traditionally the Greeks were seafarers and their interests are reflected in *periploi* (“sea routes around”), which correspond to modern “Pilots”, with descriptions of sea distances, landfalls, coastlines, river estuaries, and harbours. The earliest *periplous* which can be hypothesized is “Homeric”: any modern analysis of the wanderings of Odysseus is controversial, but it may not be entirely fanciful to see in the *Odyssey* some reference to knowledge of Italian, Sicilian, and north African waters acquired by the Greeks during the first phase of western colonization (c.750–650 BC): see, for example, Bradford’s comparison of Odysseus’ landfall among the Laistrygonians at *Odyssey*, 10. 87–97 with the (British Admiralty) *Mediterranean Pilot* account of Porte de Bonifacio in southern Corsica. Many such *periploi* appeared over the centuries, involving navigation all round the Mediterranean and also in the Atlantic, and in eastern waters too, after the voyage of Alexander’s admiral Nearchus from the Indus to the Persian Gulf. Perhaps the most important of these is the *Periplus Erythraei Maris*, written by an Egyptian Greek about the middle of the 1st century AD: it describes routes around the coasts of east Africa and southern Arabia and the direct route, using the recently discovered monsoon, to the west coast of India.

Over time these two approaches to cartography, geography and chorography, drew on and enriched each other. For example, the huge map of the known world created by Marcus Agrippa at the behest of Augustus and displayed on a portico in Rome late in the 1st century BC was the result of the accumulation of chorographic as well as geographic information, while the huge engraved maps of the city of Rome created in the Flavian and Severan periods (of which stone fragments survive) represent the culmination of the tradition of detailed depiction of limited areas.

Cassius Dio c.^{AD} 164 – after ^{AD} 229

Historian

Cassius Dio originally came from the prosperous city of Nicaea in Bithynia in northern Asia Minor, but was probably taken to Rome as a boy when his father Cassius Apronianus became a senator. Thus Dio, born in the Greek east and brought up in Rome, had a dual heritage. Following in his father's footsteps, he entered the Senate under Commodus (reigned ^{AD} 180–92), was awarded a praetorship by Pertinax (ad 193), and, probably around ^{AD} 204, was made consul by Septimius Severus (ad 193–211). His career continued to prosper under Severus Alexander (ad 222–35), who in quick succession appointed Dio proconsul of Africa (c.^{AD} 223), legate of Dalmatia (c.^{AD} 224–26), and legate of Upper Pannonia (c.^{AD} 226–28). These appointments were certainly prestigious, but Dio, who was no longer a young man, was thereby prevented from spending much time in either Italy (where he had a pleasant villa at Capua) or Bithynia. In the end, Dio did not forget his eastern roots, although much of his adult life was spent serving Rome around the empire. After holding his second consulship in ^{AD} 229, he retired to Bithynia to nurse his bad feet (80.4. 2–5. 3). The precise date of his death remains unknown.

Dio's most important achievement is his monumental historical work, the *Roman History*, which was written in Greek and originally contained 80 books narrating events from the origins of Rome until ^{AD} 229. The Bithynian senator claims that the impetus to write, history came from Septimius Severus. This emperor had so much enjoyed Dio's earlier work on the dreams and portents that heralded his principate that he wrote a letter to say so (72. 23. 1): that same night Dio dreamed that a divine power ordered him to write a historical narrative of Severus' rise to power, and the success of this work eventually resulted in Dio composing the *Roman History*. Today we have *Roman History* 36–55. 9 (covering the years 69–6 ^{BC}) almost intact, but the remaining books are preserved only in fragments and epitomes. Proudly Dio claims that he spent 10 years conducting historical research and 12 years actually writing the narrative until the death of Severus in ^{AD} 211 (72. 23. 5). This assertion is designed to generate confidence in the *Roman History* as a well-crafted historical work and echoes the claims of previous historians writing in Greek: Diodorus Siculus claims to have spent 30 years on his history, and Dionysius of Halicarnassus 22 years. Above all, Dio was influenced by Thucydides, from whom phrases, ideas, and techniques were

borrowed. So, Dio's Fabius Rullus argues against excessive retaliation for a Latin revolt (fr. 36. 1) in a way that recalls Thucydides' Diodotus during the Mytilenean debate. Dio's stylistic and intellectual debts to the 5th-century BC historian Thucydides can be seen as symptomatic of the Greek cultural revival known as the Second Sophistic.

At the same time, Dio owed much to the Roman historio-graphical tradition. For chronology the *Roman History* uses the official Roman year dated by consuls as the principal structural device, but, like Tacitus, Dio does not allow himself to be restricted by this potentially rigid annalistic format. So Dio organizes material along biographical lines, particularly when narrating the principate: individual emperors are often both introduced and allowed to leave the stage with separate character sketches. Likewise, Dio was prepared to narrate events that spanned several years in one continuous segment of narrative, particularly in the case of foreign campaigns (49. 19–33). Moreover, he clearly knew Latin: he appears to have read Seneca's *Apocolocyntosis* (60. 35. 3–4) and laments the fact that he cannot find a direct equivalent for the Latin word *auctoritas*, which he transliterates in Greek (53. 3. 4–5).

Ideologically, Dio valued the stability created by the principate and observed pithily that “Monarchy sounds unpleasant, but it is the most practical form of government under which to live” (44. 1. 2). This stance does not make him uncritical of incompetent emperors, and even Septimius Severus, who inspired Dio to write history, is given a balanced treatment. We are repeatedly offered perspectives on the principate that reflect the senatorial point of view. So, when Commodus decapitates an ostrich and brandishes the head at the senators, Dio discreetly hints to his colleagues that they can avoid laughing by chewing on the laurel leaves of their crowns (72. 21. 1–2). In his narrative Dio's judgement on particular emperors often rests on how well they treated his fellow senators.

Nor does Dio's general approval of the imperial system lead him to ignore the difficulties of historical inquiry under the principate, when the size of the empire and the secrecy in which important decisions were taken made it difficult to reconstruct events (53. 19). Dio, who spent his professional life working under the emperors, was fascinated by the transition from republic to principate, as is clear from the fact that the *Roman History* devotes much more space to this period than to any other. Today historians especially value Dio's sophisticated and clear narrative of the triumviral era, and passages such as the unusually frank reassessment of Cicero (38. 12) show that Dio can offer us valuable alternative perspectives on leading historical figures of the period. Perhaps Dio's own experiences of confronting turbulent armies in Pannonia (80. 4) may have sharpened his interest in the

triumviral age as a whole.

Dio was the last substantial writer of annalistic history from the ancient world whose work is at least partly extant. The Byzantine scholar Photios had read Dio and regarded him as a much clearer writer than Thucydides. Perhaps this enthusiastic response was partly because Dio's subject matter in the *Roman History* must by its very nature have appealed to educated readers in the Byzantine world, who saw their state as a continuation of the Roman empire. Many fragments of the *Roman History* have survived thanks to the efforts of the excerptors who worked for the emperor Constantine VII Porphyrogenetos (913–959). There is a useful epitome of books 36–80 made in the late 11th century by John Xiphilinos, who selected episodes from Dio that he regarded as particularly entertaining or enlightening. Moreover, early in the 12th century, John Zonaras wrote an *Epitome of Histories*, which was a universal history documenting events from the creation until AD 1118. A comparison between the *Epitome* and extant portions of the *Roman History* shows that Zonaras tended to paraphrase Dio fairly freely, but the Byzantine historian did preserve a version of *Roman History* 1–21 (now lost), which served as one of his chief sources for early Roman history. Subsequently, in Paris, the king's printer Robert Estienne produced in 1548 the first printed edition of Dio's *Roman History*, which ensured that the work was widely read. Finally, Dio's *Roman History* was competently edited by U.P. Boissevain (1895–1931), and his text still serves as the starting point for most modern editions.

Biography

Born at Nicaea c.AD 164, Cassias Dio was educated in Rome and followed his father into the Senate. He held the consulship twice and after the second time (AD 229) he retired to Bithynia where he died (date unknown). Dio wrote in Greek a *Roman History* in 80 books, taking events from the origins of Rome to his own day, of which about 20 books survive intact (covering 69–6 BC) and fragments of the rest.

Catana

City in Sicily

The city of Catana lies on the coast in the centre of eastern Sicily, its harbour facing the Ionian sea – an excellent site for a port. It occupied the north side of a fertile volcanic plain in the shadow of Mount Etna; its sister city, Leontini, was situated to the south. No doubt the intention of the Ionians in founding the two cities was to control access to the rich agricultural plain. Catana was also located near a delta formed by three major river valleys reaching westwards into the interior, which was occupied by Sicels.

The Ionian colony at Catana was founded c.729 BC by Chalcidians from the mother colony of Sicilian Naxos, itself founded by a group of Chalcidians from Euboea. The *oikistes*, or founder, was Euarchus. In the early period a great variety of Greek pottery – Corinthian, Athenian, Chalcidian, Chian, East Greek, and Spartan – indicates that the native Sicels were well acquainted with the Greeks, primarily through trade. Once the Ionian colonists settled on the site, relations appear to have been relatively peaceful, with the archaeological evidence suggesting that the two groups lived amicably side by side. Thucydides (6.2), however, says that the Sicels retreated inland and to the north with the arrival of the Ionians on the east coast of the island.

Catana was autonomous in the Archaic period, with a very active political and economic life. Greek goods gradually made their way into the interior along the river valleys; archaeological evidence indicates that the area was fairly well Hellenized by the end of the 6th century BC. The lawgiver Charondas (c.500) established one of the earliest codes of Greek law, pertaining primarily to the giving of evidence in court and rules governing contracts. These laws were successful in retaining aristocratic power without dissension among the colonists, and his law code became famous throughout Greece. Stesichorus, the choral lyric poet, was also resident in Catana at this time. Only fragments of his work survive, but they show that his treatment of myth was an important stage in the transition from epic to tragedy in Greek literature.

By the early 5th century BC the city had lost its autonomy and was under Syracusan control. In 475 Hieron I, tyrant at Syracuse, invaded Catana and expelled the inhabitants. He repopulated the site with Dorians and mercenaries and renamed the city Aetna, setting up his son Deinomenes as ruler, but the Catanians returned in 461 and the old name was restored. Later in the century, during the Sicilian expedition (415–413 BC), the city supported Athens, which used it as a base for attacks against Syracuse. When the Athenians were defeated, the city was occupied by Dionysius I, another tyrant ruling at Syracuse, who sold the entire population into slavery and settled his Campanian mercenaries there. From then on Catana formed part of the Syracusan empire. Diodorus Siculus (14. 59. 2) relates that the lands were given to the Sicels with the Ionians remaining in exile until 358, when the survivors moved to Tauromenium (Taormina). The Campanian mercenaries still inhabited Catana when it was conquered by Rome in 263 BC during the First Punic War.

In the 5th century the city was celebrated by the poet Aeschylus in his now lost play *The Women of Aetna* (c.470 BC), and it was the centrepiece for Pindar's *Pythian* 1, a choral lyric composed for the festival in honour of Apollo at Delphi, at which the major event was a musical competition for a hymn to the god.

Little is known about the physical appearance of the Greek city, as its remains were largely obliterated by the lava flow of 1669. Architectural fragments on the acropolis, a sanctuary of Demeter, long theatre walls, and the contents of Hellenistic graves outside the ancient city, do however attest to its presence.

In the 2nd and 1st centuries BC the city was given the status of a *civitas decumana*, flourishing under the Roman Republic, although it suffered damage in the First Slave War (135 BC). Catana became a Roman colony under Augustus (21 BC). Most of the extant physical remains in Catana date to the Roman imperial period, when the city

was very prosperous. Having maintained and improved its port facilities, it served as a centre for the shipment of timber and basalt millstones.

The vast majority of Sicilian craftsmen were Greek-speaking, and the epigraphical evidence indicates that even into the Roman period roughly half the population on the island still spoke Greek, while the other half spoke Latin. The Greek calendar continued in use into the early imperial period, and the year was officially dated according to the eponymous priest-hood of Zeus Olympios at Syracuse. It appears that Sicily was never fully Romanized and that Greek was widely spoken, especially in the rural areas, which were hardly affected by the Roman incursion. In fact, much of the island seems to have remained Greek until the end of the Roman empire. Catana retained its importance through the Byzantine period, and was one of the first and most important Christian communities in Sicily.

The Chalcidians were the earliest and most prolific colonizers on the eastern coast of the island, laying claim to the whole northeastern part of Sicily in two decades with the establishment of colonies there – one of the first settlements was located at Catana. Through peaceful coexistence with the native Sicels, Catana was a vital factor in the establishment of a Greek foothold on the eastern coast of the island, controlling as it did the agricultural products of the fertile volcanic plain and, by virtue of its excellent harbour, serving as a base for Greeks trading with settlements further to the west along the shores of the Mediterranean Sea. Catana played an important role in the Hellenization of the eastern central part of the island, a process so successful that the city was emblematic of a strong Greek presence in Sicily long after it became part of the Roman empire.

Caucasus

Region between the Black Sea and the Caspian Sea

The Caucasian mountains, which, with their many rivers, lakes, and passes, divide the northern Caucasus from Transcaucasia, were familiar to the Greeks, but they knew only the name and massiveness of this range. Herodotus was the first to give information about the mountains and the peoples who dwelt there, living a primitive and barbarian life. Alexander the Great was mistaken in thinking that the Hindu Kush was part of the Caucasian range. Although Strabo gives a good description of the mountains, ancient authors were wont to mislocate them to or conflate them with the Urals as well as the Hindu Kush.

This very distant and mysterious mountain region had its place in Greek mythology. The Caucasus was the land of Arimasps and of griffins, who guarded its gold treasure. Prometheus, having stolen the secret of fire and given it to man, was punished by being chained to Mount Elbrus, one of the highest peaks in the Caucasus, while an eagle sent by Zeus picked continuously at his liver until he was unbound by Heracles, who slew the eagle. There are several local versions of the myth and cult of Prometheus. In Georgian folklore Prometheus is called Amirani. In Greece itself there are many other versions: for example, in Athens he was worshipped by potters and in the Academy; in Thebes one of the Cabin is named Prometheus and his son is Aetnaeus.

To the south of the Caucasian mountains lies Transcaucasia, known to the Greeks as home to the ancient civilizations of Colchis, Iberia, Armenia, and Albania, the first three being familiar to them but the latter beyond their interest and involvement.

Colchis was the best known thanks to the establishment of the Ionian colonies of Phasis, Gyenos, and Dioscurias on its Black Sea coast in the mid-6th century BC. In Greek imagination Colchis was the final destination of Jason and the Argonauts, who sailed there to retrieve the golden fleece. This, one of the most popular Greek myths, had a very strong impact on ancient art, and over several centuries

artists depicted scenes from it. One of the most popular figures in Greek literature and art was Medea, the barbarian Colchian princess, granddaughter of Helios and daughter of Aeëtes, king of Colchis. Thanks to her sorcery and love Jason was able to depart from Colchis with the golden fleece; he also took Medea, and later married her. When he attempted to repudiate Medea she killed their children. The popularity of herbal medicines in ancient Greece was linked to Medea and her magical powers.

For Greeks Colchis was a land rich in gold, iron, timber, and honey. Ancient authors state that these natural resources and raw materials, together with slaves, were exported to Greece. In their Writings it was alleged that particles of gold were washed up by the mountain streams of the Caucasus, and that Colchians used to place fleeces in the water to catch them. This is but one of many interpretations of the golden fleece in ancient Greek literature. It is thought that when Greeks initially arrived in the vicinity of Phasis they saw a very beautiful species of bird, previously unknown to them, which they started to export to Greece. They named it “bird from the Phasis river” (pheasant).

Colchian elite culture was strongly influenced by Greek. This is reflected in architecture, sculpture, goldwork, etc. Greek craftsmen were employed; the cults of Apollo, Dionysus, Helios, Heracles, and the Dioscuri were common; Greek was widespread as the official and religious language. Greek influence continued via Byzantium from the 4th century ^{AD} with the adoption of Christianity as the state religion of Egrisi (successor to Colchis; modern western Georgia) and Iberia (eastern Georgia). Early Christian church architecture showed strong Byzantine influence, and the Georgian Church itself was a Byzantine offshoot. In the medieval period, Georgian icons were opulently decorated with enamel, initially influenced by Byzantine practice before a distinct Georgian school grew up (as was the case with religious mural painting and mosaics). A new wave of Greek settlers (known as Pontic Greeks) appeared from Anatolia in the wake of the Graeco-Turkish conflicts of the later 19th century. They settled in western Georgia in new villages which they established, and preserved their linguistic and cultural identity. Many “returned” to Greece following the collapse of the Soviet Union.

Iberia and Armenia were subject to weaker Greek influence. The predominant external influence was Achaemenid Persia. But the subsequent creation of Hellenistic kingdoms in the east brought the full weight of Hellenic culture to bear. This was reflected in the layout and architecture of cities, in crafts, and everyday life. Armenia was also Christianized and enjoyed close links with Byzantium.

Celibacy

By definition celibacy implies self-sufficiency and separation. It points to a hierarchy of relationships with the divine and establishes superiority. The celibate becomes the symbol of purity and the conveyor of special religious powers. In antiquity sexual abstinence was demanded of priests and priestesses of certain deities. However, in the case of priestesses the main idea of celibacy was that they lived in marital relation to the divine. Thus, old peasant women that could no longer have sexual intercourse were chosen for the position of Pythia at the temple of Apollo at Delphi, serving as “brides” of the god. A few days of sexual restraint were also required of participants in the cults and this was probably connected with the idea that sexual intercourse is polluting because it opens the possibility of demonic infection. As far as male celibacy in antiquity was concerned, one could distinguish two types: first, that of the priest whose celibacy was demanded for purely ritualistic reasons; and secondly the philosophically grounded celibacy of such groups as the Pythagoreans and the Stoic philosopher Epictetus, who saw the philosopher’s task as necessitating a detachment from the mundane requirements of family care. Yet, it is worth noting here that in pre-Christian times celibacy was also considered, particularly by the Athenians, as “evil” because it prevented the reproduction of the human race and negated the “natural laws” of human existence. Plato and Plutarch even mention that special laws existed against celibacy.

Though in antiquity celibacy seemed primarily to serve a ritual function, in the early Christian Church it came to serve an ethical one as well. The celibate state was extolled by the Church Fathers and from then on was regarded as explicitly superior to being sexually active, even within the context of marriage. In the first centuries of Christianity, due to eschatological expectations, many Christians chose to live in celibacy, for, “when they rise from the dead, they neither marry nor are given in marriage, but are like angels in heaven” (Mark 12: 25). In the beginning, both celibate men and celibate women lived in the same communities and this cohabitation of the sexes was viewed as involving a more rigorous ascetical effort. Thus was created the institution of *syneisakton parthenon* or the *subintroductae* (celibate

women cohabitating with clerics or monks), which, however, was condemned by the First Ecumenical Council in 325 (canon 3).

Censorship

Censorship is a means of preventing the expression of ideas, speech, or behaviour. Social, religious, political, military, and other authorities practise censorship in the name of the common good of society, seeking to protect it from heresy, obscenity, treason, or ideological error. In one form or another censorship has existed universally throughout Greek history.

Most of the censorship among the ancient Greeks occurred over religious and political ideas. The common charge was impiety (*asebeia*). Since they believed that the gods could actively help or harm the city state, impious behaviour that might invoke divine wrath was punished. Sparta imposed a rigid system of censorship to protect its militarism: books, music, and even learned men were banned. Greek tyrants exercised censorship to silence and eliminate their opponents. Generally speaking, under the tyrants, and many other rulers, censorship was identical with harsh repression.

Artists were not usually censored, but one notable exception in the first half of the 4th century was the case of the Athenian courtesan Phryne, who was charged with impiety because she modelled for a nude statue of Aphrodite by Praxiteles. Hyper-ides, pleading her case, tore her clothes off at the height of his defence, and asked the all-male jury if there was anything about her body that was offensive to the gods or man. She was rather quickly acquitted.

Censorship of playwrights occurred on a number of occasions. Euripides, who played no active political role, was charged with *asebeia* by Cleon, as were other dramatists including Aristophanes. Humour was sometimes used to censure behaviour through the weight

of public opinion, becoming thereby an unofficial form of censorship to those afraid of being satirized. Those mocked would occasionally seek to punish the jokers. Plato in the *Laws* advocates censorship of those forms of comedy that are cloaks for vicious personal attacks. Tragedies could also be banned. In 493 BC a tragedy written by Phrynichus and produced at the Dionysia on the theme of the failure of the Ionian revolt, and the fall of Miletus deeply moved the audience; fearing turmoil, the authorities fined Phrynichus and banned the play.

Athens, though democratic, censored many thinkers, artists, and intellectuals; they were exiled, imprisoned, or executed, or they took flight. Aeschylus was accused of violating the secrecy of the Eleusinian mysteries. Phidias was also accused of impiety and fled to Olympia. Protagoras, the famous sophist, was censored for his remark "Man is the measure of all things." Accused of atheism, he was banished from Athens and certain of his books were burned.

The beliefs of the Greek philosophers laid them open to various charges. Xenophanes criticized the morality of the Olympian gods as portrayed by Homer and other poets, arguing that their behaviour was shameful. This generated complaints of atheism (impiety) against him. Similarly, Anaxagoras of Clazomenae (c.500–428 BC) had argued that the sun was a hot rock. Convicted of impiety, he was banished from Athens and died in exile at Lampsacus. The real motive for the prosecution was probably to embarrass his patron Pericles.

The most famous case of censorship of a philosopher was the trial of Socrates on charges of corrupting youth (the moral charge) and impiety (the religious charge). The resulting judicial murder on these trumped-up charges was to have a profound influence on many including his most famous pupil, Plato. Oddly it is Plato who in the *Apology* stated the implications of a refusal to accept censorship, and later in the *Republic* himself instituted a system of censorship.

Plato's *Republic* has been widely read since it was first written and it has influenced many who would seek to impose censorship. Plato believed that whatever entered the soul would either develop it or corrupt it. In his utopian Republic a system of censorship is described that would mould the minds of all citizens, but especially the Guardian class, through a system of censored education. This included censorship of music, for Plato believed that music could have a profound impact on the soul and that it was important that the right music be heard at the right time. It should be noted that on several occasions intellectuals sought to censor those they disagreed with; Plato, for instance, wanted to burn the works of Democritus.

Aristotle also advocated a form of educational censorship in his *Politics*. Following the death of Alexander the Great, Aristotle himself

became a victim of censorship. He was charged with impiety, but fled “lest Athens sin twice against philosophy”.

During the Hellenistic period many states adopted a policy of punishing external political threats quickly, but they usually left native populations and cultures alone. One notable exception was the Seleucid policy of forced Hellenization, which censored any opposition to assimilation. This policy was violently resisted by conservative Jews, whose resistance and success in arms is described in the books of Maccabees and still celebrated at the festival of Hanukkah.

The establishment of great libraries at Alexandria and elsewhere led to two forms of literary censorship. When editors collated manuscripts, they often found variants in the copies and decisions had to be made about which was the “correct” version. Editors could also make important changes when issuing new editions of older works and thereby influence the interpretation of the text.

The other form of literary censorship was mob rule. On a number of occasions mobs or conquerors sacked and burned libraries. The library at Alexandria was damaged and burned during Julius Caesar’s siege in 42 BC, by Christians in AD 391, and by Muslims in AD 642. In the Christian era political charges were brought against missionaries and other Christians. Because the worship of the emperor was equated with political loyalty, the Christian refusal to comply led to their persecution – in effect a violent form of censorship. St John was exiled to the island of Patmos and some scholars believe that the apocalyptic style of the book of Revelation was a religious cover that enabled the book to get past the censors.

With the conversion of the emperor Constantine and the legitimization of Christianity, a brief period of toleration occurred, which ended with the triumph of Christianity as the only licit religion. Under the emperor Theodosius I pagan religions were proscribed, sexual regulations were imposed, and the Olympic Games stopped. Theodosius, like Constantine before him and others after him, repressed unorthodox beliefs. The union of Church and state meant that heresies contrary to the Nicene Creed were viewed as political opposition and thus deserving of censure. The emperor Justinian I, seeking political unification through theological orthodoxy, also persecuted heresies, and he closed the philosophical schools in Athens (ad 529).

Chaeronea, Battle of

Battle fought between Macedonians and the southern Greeks in 338 BC

It was in the territory of Chaeronea on 2 August (or possibly 1 September) 338 BC that the decisive battle was fought that enabled Philip II of Macedon to bring the Greek homeland under his control.

When Philip negotiated the peace treaty that ended the first war with Athens in 346 BC, his aim seems to have been to win the Athenians' friendship and cooperation, and he insisted that the treaty should be accompanied by an alliance. It failed, however, to effect a real reconciliation. The Athenians could not forget what they saw as his treachery over Amphipolis in 357 BC and they were not reassured by his treatment of their Phocian allies in the immediate aftermath of

the treaty's conclusion. Thereafter, although in 344 BC he made an apparently genuine attempt to allay the Athenians' suspicions by offering to amend the peace terms, Philip persistently intervened in Greek affairs in ways that enabled Demosthenes and others at Athens persuasively to depict him as untrustworthy and hostile. In 340 BC he began to threaten the Athenians' corn-supply route from the Black Sea and attacked Perinthus on the Propontis (Sea of Marmora) and Byzantium. His failure to take either city and their own earlier success in expelling his friends from Euboea encouraged the Athenians, who at once declared war when Philip seized their corn fleet near the Bosporus in September.

To wage war positively, Philip needed to threaten Athens, but his old allies the Thebans had recently seized the pass of Thermopylae and seemed likely to bar his way (previously, in 346 BC, a treacherous Phocian general had enabled him to take it and subdue the Phocians). However, a dispute in the Delphi-an Amphictyony, of which he had been a member since 346 BC, led to a sacred war being proclaimed against Locrian Amphissa and, after the failure of the Amphictyons' first campaign, Philip was given the command.

In autumn 339 BC he advanced over the difficult pass into Doris, ostensibly to attack Amphissa, but unexpectedly turned eastwards down the Cephissus valley and took Elatea on the road from Thermopylae to Thebes, demanding that the Thebans assist him or at least facilitate his invasion of Attica. Demosthenes persuaded the Thebans to refuse and an Athenian force moved into Boeotia. Philip made no further move until the spring of 338 BC, when he took Amphissa. He then made a final attempt to achieve his aims without a battle, but his offers were rejected at both Thebes and Athens; he advanced into northwest Boeotia to find that his enemies were barring his way in a gap of about 2.5 km between the Cephissus and the low hills to the west.

In view of the battle's importance, the information provided by the sources is disappointingly meagre. It was a characteristically Greek head-on clash between two armies consisting of hoplites, heavily armed infantry in close formation, but there is no agreement on their relative strengths. Diodorus Siculus (16. 85) says that Philip with "more than 30,000 infantry and no less than 2,000 cavalry had the advantage in numbers", while Justin (9. 3) gives the Greeks numerical superiority, a conclusion suggested by the incomplete figures in Plutarch (*Demosthenes*, 17). According to Demosthenes' speech *On the Crown*, contingents from Euboea, Achaëa, Corinth, Megara, Leucas, and Corinth supported the Athenians and the Thebans.

As to the disposition of the forces, Diodorus (16. 86) says that Philip faced the Athenians on one wing and his son Alexander faced the

Thebans on the other, but gives no further details; Plutarch, however, links Alexander with the river Cephissus on the Macedonian left (*Alexander*, 9).

Diodorus writes in general terms of the fierce fighting, both sides for a while having “hopes of victory”, before Alexander’s men gradually broke down their opponents and put them to flight (Diodorus’ words give no support to the modern theory that his cavalry broke the Theban hoplites), while Philip did the same to the Athenians; although, according to Polyaeus, the collector of military stratagems writing in the 2nd century AD, this was only after a feigned retreat had lured them up a slope to disrupt their order – the only detail of the action provided by the sources.

Information about casualties is also sparse. The only figures in the sources are for the Athenians, more than 1,000 dead and at least 2,000 captured (Diodorus, 16. 86). Theban losses were probably heavier and Plutarch (*Pelopidas*, 18) reports that the Theban Sacred Band of 300 picked hoplites were totally destroyed, although excavations beneath the Lion monument erected in their honour revealed the remains of only 254 bodies.

Philip’s victory was so emphatic that he did not need to press on to attack Thebes and Athens. The Athenians prepared to defend their walls, but, still preferring to win their cooperation rather than to crush them, the king paid the due honours to their dead and released their prisoners without ransom. Thereupon they readily accepted his peace terms, agreeing to renew their alliance with him and to dissolve what was left of their maritime confederacy in return for keeping inviolate their territory and institutions. The Thebans were less fortunate, having to ransom their prisoners and accept both a Macedonian garrison and an oligarchic regime dominated by Philip’s friends. He then installed a garrison in Corinth and secured friendly regimes in other states, encountering resistance only at the borders with Sparta, where he used a little force to secure the frontiers of the Spartans’ neighbours, but otherwise ignored their continuing defiance.

His military control established, Philip ensured his political supremacy by organizing a settlement along the lines of the earlier “common peace” treaties, designed to secure the peace and the loyalty of the Greeks. Confident of his domination, he persuaded them to appoint him leader of a Panhellenic invasion of the Persian empire. After his murder in 336 BC, the decisive quality of his victory was further shown in the meagre support mustered by the Thebans for their rising against Alexander the following year. Macedonian domination was reemphasized by their swift suppression and the total destruction of the city at Alexander’s hands, although it was never accepted and was seriously challenged in the confusion following his

early death in 323 BC. Greek freedom was never fully restored, not even in the brief period (243–224 BC) when Macedonian garrisons failed to hold Corinth, and in 196 BC the Romans took indirect control of the peninsula, formally annexing it in 146 BC.

The significance of Philip's victory has continued to be recognized in the modern world. In his tenth sonnet (pub. 1645) John Milton referred to it as "that dishonest victory at Chaeronea, fatal to liberty" and George Grote, the first great British historian of ancient Greece, called Philip "the destroyer of freedom and independence in the Hellenistic world" (*A History of Greece*, 1846). The Lion monument was seen by Pausanias in the mid-2nd century AD, but was later demolished. Its fragments were accidentally discovered by the traveller George Lidwell Taylor in 1881, and it was restored and replaced on its ancient plinth beside the old main road north from Levadia by the Greek Archaeological Society in 1902–04.

Chalcidice

Region of northern Greece

Lying as it does beyond the land routes that cross Macedonia and being separated from the rest of the country by natural barriers, Chalcidice has had a history that differs from that of mainland Macedonia. The western part of the country was closely associated with Thessalonica: whoever was in control of the city usually had control of western Chalcidice. Chalcidice as a whole is particularly rich in timber and minerals, which is why all powers with an interest in the north Aegean area made efforts to gain control of the region.

Chalcidice first entered Greek history in the 8th century BC with the founding of the first Greek colonies. The country was colonized by the Ionian cities of Euboea, notably, though not exclusively, Chalcis (which provides the etymology of the name Chalcidice). There was only one Dorian colony in Chalcidice, Potidaea on the isthmus of the Pallene peninsula, which was founded by Corinthians c.700 BC. Most significant of the other Greek colonies were Olynthus in southwest Chalcidice, Mende and Scione in the Pallene peninsula, Torone in the Sithonia peninsula, Acanthus and Stageira (birthplace of Aristotle) in

eastern Chalcidice. The Greek colonization was mainly of an urban type and localized in the coastal areas of the country. An exceptional case was the colonization by Chalcis of rural southwestern Chalcidice which expanded over the area around Olynthus. There settlers from Chalcis lived side-by-side with the non-Greek Bottiaeans. The Greek colonies of Chalcidice became bridgeheads for the diffusion of Hellenic culture in the hinterland. The first to receive cultural influence from the Greek colonists were the earlier settlers of Chalcidice, the Thracians, Bottiaeans, and Pelasgians; they had become completely Hellenized by the Hellenistic era when Chalcidice became an integral part of the Macedonian state.

In the aftermath of the Persian Wars the cities of Chalcidice were included in the Athenian sphere of influence and all of them joined the Delian League. Events in Chalcidice were among the causes for the outbreak of the Peloponnesian War, as Potidaea was encouraged by its mother-city Corinth to break away from Athenian control in 432 BC. Athens sent an expeditionary force against Potidaea and managed to capture it after a two-year siege. The hostility to Athens, however, was not confined to Dorian Potidaea, but spread among the Ionian Chalcidians as well. Following the advice of the Macedonian king Perdiccas II, an enemy of Athens, the Chalcidians of the area around Olynthus were resettled inside the town in 432 BC, increasing its size and strength and making it a stronghold of anti-Athenian sentiment. More Chalcidian cities reversed their allegiances during the campaign of the Spartan general Brasidas between 424 and 422 BC. The cities that revolted against Athens, starting with Olynthus, made up the nucleus of the Chalcidian League which, after the end of the Peloponnesian War, expanded over the entire region. With a foreign policy dictated from Olynthus, the Chalcidian League built up particularly strong armed forces and, by switching alliances between Sparta, Athens, Thebes, Macedonia, and the Thracian kingdoms, played a leading role in north Aegean politics during the first half of the 4th century BC.

Chalcidian power was challenged when Macedonian imperialism took shape during the first years of Philip II's rule. His first involvement in the affairs of Chalcidice took place in 357 BC when he drove the Athenians out of Potidaea on behalf of the Chalcidian League. Soon, the cities of Chalcidice themselves became victims of Macedonian expansionism, as Philip occupied one after another. Faced with this threat, Olynthus turned for help to its old enemy, Athens, and this provided the occasion for Demosthenes to write his three renowned *Olynthiac* orations urging his fellow citizens to support by all means their former enemies in Chalcidice. Nevertheless, Olynthus fell in 348 BC, Chalcidice became an integral part of the Macedonian

state, and, later on, was incorporated into the Roman province of Macedonia. The Hellenistic era is marked by the development of Cassandreia (founded by Cassander in 316 BC), which became one of the major cities in Macedonia and one of its few Roman colonies (Pella, Dion, and Philippi were the others).

Chalcis

City in Euboea

Chalcis is located on the narrowest point of the Euripus and is the capital of the district of Euboea. Today it is a bustling capital city of about 50,000 inhabitants and the town profits from trade in several important commodities (including livestock, butter, and agricultural tools). Modern Chalcis obscures the remains of the ancient city, which was famous for its manufacture of bronze (the city may have received its name from this trade, since *chalkos* means “bronze”). The Mycenaean city praised by Homer (*Iliad*, 2. 540) has yet to be discovered, but some ancient remains from the late Geometric period on have been found in the area of the modern town.

Chalcis played an important role in the developments of Geometric and Archaic Greece. The inhabitants were known for their commercial enterprise (including trade in pottery and metalwork) and colonizing ventures (founding colonies and trading posts on the coasts of Sicily, Italy, Chalcidice, Thrace, the islands of the Aegean, and possibly Syria). Perhaps most famous, while at the same time least understood, is the role that Chalcis played in the Lelantine War with Eretria. Apparently, during the late 8th century BC Chalcis and Eretria were in competition for land and power, which led to a war over the rich Lelantine plain. Strabo (*Geography*, 10. 1. 9) says that this plain was famous, among other things, for its curative hot-water fountains, which were even used by the Roman general Sulla. This early Hellenic conflict over the Lelantine plain involved, at least, Miletus, which supported Eretria, and Samos, which supported Chalcis. Thucydides

implies that numerous other states were involved. While the 8th-century victor is unknown, Chalcis seems to have held the plain in the 7th century BC.

Chalcis was ruled by a monarchy until the 7th century BC, when its last king Amphidamus was killed in battle. (Aristotle, in *Politics*, 1304a, mentions a later, but otherwise unknown tyrant, Phoxus, who was overthrown by the elites of the city.) The aristocracy then took over, and eventually supported the Athenian tyrant Hippias who fled there after his expulsion from power. Tragically for their independence, the people of Chalcis allied with Boeotia against Athens, partly in an attempt to restore Hippias. The Athenians then attacked and defeated the Chalcidians, took their land for the settlement of 5000 cleruchs, dismantled their navy, and assumed control over their colonies in Italy and Sicily. The Athenians, proud of their success against Chalcis, set up a chariot on the Acropolis and inscribed it with news of their victory (Herodotus, 5. 77. 4; Diodorus, *Historical Library*, 10. 24. 3). In 480 BC the people of Chalcis supported the Athenians against Persia and sent at least 20 ships to the Greek fleet. Soldiers of Chalcis also fought in the Battle of Plataea.

Demosthenes in his orations on *Philip*, *On the False Assembly*, and *Against Midias* highlights the role that Chalcis played in early Macedonian attempts to influence and control Greece. Originally Callias, the general from Chalcis, supported Philip, but he then turned against Macedon in a successful attempt to rid the Euboean cities of Oreus and Eretria of tyrants. Nevertheless Philip took the city and garrisoned it in 338 BC. It remained important as a strategic control point and trade centre until 146 BC, when it was attacked and severely damaged by the Romans.

Once in the Roman sphere, the city, and Euboea, first became part of the province of Macedonia, and then in 27 BC the island became a part of the province of Achaëa. Chalcis, due to its strategic location, remained economically viable throughout the Roman period. During the early Byzantine period, pagan temples were replaced with Christian monasteries and churches. By the 9th century AD silk was crucial to the economic life of the provincial Byzantine nobles in Chalcis. (In 1147 Roger II, king of Sicily, used his army to kidnap silk workers from Chalcis.) The Venetians captured and fortified the city in 1210, and made it the capital of Negroponte ("Black Bridge", referring to the whole of Euboea), the name deriving from a corruption of the Greek *ston Egripo* ("on the Euripus") and the Italian *ponte*, referring to the movable bridge built by Justinian. After a brutal battle in Chalcis against Sultan Mehmet II in 1470, the town fell to the Turks and then became the headquarters of *kaptan pasha* (admiral). The remains of the Turkish fortress, built in 1686 on top of the castle of Karababa

(originally designed by the Venetians), apparently rest on even more ancient foundations – perhaps those of a Macedonian fort built c.334 BC. Chalcis remained in Turkish hands until 22 February 1833 when at last Chalcis and Euboea were freed from external rule, and Euboea was declared part of independent Greece.

The bridge spanning the Euripus channel at Chalcis also has an interesting history. The first fixed bridge was wooden, built in 411 BC, partly to interfere with Athenian maritime trade. In 334 BC towers, a wall, and gates were added to strengthen the defensive capabilities of the bridge. This structure remained more or less intact until Justinian replaced the fixed structure with a movable wooden bridge (intended to facilitate water-borne traffic).

Chersonese, Thracian

The Thracian Chersonese, now known as the Gallipoli (Gelibolu) peninsula in modern Turkey, is a long, narrow peninsula forming the European side of the Hellespont (Dardanelles) and connecting the Sea of Marmara with the Aegean. It was always important as a wheat-exporting region, but even more because of its strategic location as a crossing point between Europe and Asia; before long, this attracted Greek colonization, mainly by Aeolians from Lesbos and Ionian Greeks from Miletus as early as the end of the 8th and the beginning of the 7th century BC. Attic black-figure vases started to reach the area from 600 BC, showing an Athenian interest in it that was to continue for centuries: probably already in the 6th century the Chersonese was a strategic point on the route along which grain imports vital for Athens

moved (by the 4th century Athens imported about half of the grain it needed from the Black Sea region). The Athenian aristocrat Miltiades the Elder established a domain of his own and built a defensive wall across the Bulair isthmus to protect it against the native Thracians; the Chersonese remained his family's property until his nephew Miltiades the Younger abandoned it to Darius I of Persia (c.492 BC). According to the account given by Herodotus (6. 34–40, 6. 103f.), the Chersonese was originally held by the Thracian Dolonci, who consulted the Delphic oracle when they were attacked by another tribe, and then invited Miltiades to protect them. Miltiades died childless, and in about 516 BC the sons of the Athenian tyrant Pisistratus sent Miltiades the Younger to take control of the region. He established himself by maintaining an army of 500 mercenaries and married the daughter of the Thracian king Olorus, who became his ally. He fled back to Athens, however, before the Persian advance, and for the next 30 years the Chersonese was under Persian control.

After the Persian withdrawal from the Greek mainland in 479, Athens quickly moved to regain control of the Chersonese – conquering the strategically important Sestus – to ensure the safe passage of Black Sea grain; the Chersonese became a part of the Delian League. Moreover, the sending of colonists there was an outlet for surplus population (among the Athenian settlements known as cleruchies founded about the middle of the 5th century BC there is a dispatch of 1000 cleruchs to the Chersonese). After the Peloponnesian War (431–404) Sparta briefly controlled the area, but it reverted to the control of Athens, who once more sent settlers there in 353 and cruelly punished recalcitrant Sestus. In 338 Athens finally ceded the area to Philip II of Macedonia; later it became part of the Seleucid empire. In 188 BC the Romans gave the Chersonese to the Attalid Eumenes II of Pergamum; it became Roman in 133 BC. Under Augustus it was turned into an emperor's estate.

Since the beginning of Greek colonization, a number of Greek towns developed on the Chersonese. Of the lesser ones (Alopeconnesus, an Aeolian foundation; Crithote, founded by the elder Miltiades and in ruins in Roman times) not much is known; more importance – varying over time – was attained by Sestus, Cardia, Elaious, and (since Hellenistic times) Lysimacheia and Callipolis (which gave the peninsula its modern name).

Sestus was situated at the narrowest part of the Hellespont (just opposite Abydus) and therefore provided the best point of departure to and from Asia; originally a Thracian settlement and mentioned already in Homer's catalogue of the Trojan army (*Iliad*, 2. 836), it was colonized by the Lesbians in about 600 BC. In 480 BC Xerxes built his naval bridge there, and in 334 BC Alexander the Great crossed from

there over to Asia. In 365 BC Sestus was held by the Persian satrap Ariobarzanes; in 360 BC the Thracians conquered the city. Under Attalid rule, Sestus seems to have retained a certain autonomy and minted its own coins; this stopped only in AD 250, when the city fell into decay. In the 6th century AD Justinian erected a fortress above the remains, and the place again had some importance in the fighting between the Latin emperors based in Constantinople and the Byzantine emperors at Nicaea in the early 13th century. As the Chersonese has not yet been much explored archaeologically (access to this military area of modern Turkey is restricted), the precise location of Sestus remains unknown.

Cardia, founded by the Milesians and occupied by the elder Miltiades and his colonists in 560 BC, had a strategic location on the west coast of the Chersonese where it opened up into mainland Thrace. In the Peloponnesian War Cardia was an Athenian naval base. Lysimachus destroyed it in 309 BC to incorporate its inhabitants into the newly founded Lysimacheia.

Elaious, situated at the southern tip of the Chersonese and dominating its entrance, was probably also an Athenian foundation and used by Miltiades as a harbour; it was famous because of its ancient sanctuary of Protesilaus (perhaps identical with the prehistoric tumulus of Eski Hisarlâk), which was pillaged by the Persian Artayctes, but apparently continued to exist until late antiquity; Alexander the Great sacrificed at Protesilaus' tomb before crossing over to Troy. Elaious served as an Athenian naval base in the Peloponnesian War and was a member of the Second Delian League from 375 BC; when the Chersonese became the property of the Thracian king Cotys I, Elaious together with Crithote (see above) remained with Athens. Elaious still played a role in the battles between Constantine the Great and Licinius in AD 323 and was, like Sestus, refortified by Justinian.

Lysimacheia was founded at the northern end of Chersonese (near Cardia) in 309 BC by Lysimachus, who intended it to be his capital. After his death in 281 the city passed through several hands and was finally destroyed by the Thracian king Diegylis in 144 BC.

Callipolis, mentioned by sources only since the 3rd century BC (it was conquered in 209 BC by Philip V of Macedon), acquired greater importance in later antiquity when Byzantium became capital of the eastern empire.

Chersonesus

City in the Crimea

Chersonesus was a Greek colony in the southwest of the Crimea peninsula (near the modern city of Sevastopol). Throughout antiquity it had an important strategic position: whoever held the city had control over the northwest section of the Black Sea, i.e. the Danube delta and the entrance to the great northern gulf which receives the waters of the Dniestr, Bug, and Dniepr.

Until recently it was commonly agreed that Chersonesus was a Dorian colony, founded by Heraclea Pontica together with Delos in the later 5th century BC and that there had probably been an earlier, small Ionian emporium. New excavations, however, have brought to light Ionian and Attic black-figure vases and terracottas of the last quarter of the 6th century BC as well as a series of spectacular ostraca of the entire 5th century, showing that the colonists had the Milesian alphabet, but used chiefly Dorian names. This new evidence proves that already in the last quarter of the 6th century BC not only Heracleots but also Ionians from the south shore of the Pontus took part in the foundation of the polis. This earlier dating was confirmed when in 1986 an intact stratum of the Archaic period (containing the traces of a sanctuary of the end of the 6th century) was found in the northeast part of the city.

Chersonesus soon seems to have acquired a large territory. In the 4th century BC the city state covered most of the southwest Crimea and its fertile coast, including towns like Kerkinitis and Kalos Limen. Fortified farms with towers were built in this area, and at the same time the production of local amphorae began (for exporting wine). Coins were also minted from the 4th century BC.

In the 3rd century BC, however, the city state was badly affected by Scythian and Sarmatian invasions. Archaeological evidence shows that all surrounding settlements were destroyed and burned: several farmhouses contained human skeletons (apparently victims of a surprise attack) and in western Crimea coin hoards were found, hastily buried by the inhabitants. In Chersonesus itself the people, apparently expecting further attacks, built a new line of town walls from grave stelae of the city's necropolis. Chersonesus never fully

recovered from this destruction; its agricultural settlements were in ruins, fields and vineyards destroyed, the export of goods and the production of amphorae almost brought to a standstill. At the end of the 2nd century Mithridates VI of Pontus protected the city against the Scythians, but Chersonesus lost its external territories; later it was integrated into the Bosporan kingdom by Asandros. When the Scythians besieged the city again in AD 60/61, Nero installed Roman soldiers and a naval detachment. Under Hadrian the Bosporanian king Cotys II also controlled Chersonesus; Antoninus Pius re-established the city's independence.

In the 2nd century AD Chersonesus was the starting point for the conversion of the Crimean population to Christianity. It was here that the banished bishop of Rome, St Clement, was martyred during the persecutions under the emperor Trajan. By the beginning of the 4th century Christianity was firmly established in Chersonesus.

During the Byzantine period, the city – now called Cherson (this name is attested at least since Hadrianic times) – gained great importance because of its strategic position in the empire's northern defence system and its control of the major sea routes. The Hellenistic town walls were repaired at the end of the 5th century and reinforced with towers and bastions in the reign of Justinian; further restorations took place in the 7th and 8th centuries. Moreover, between the 5th century and the end of the 10th some 30 churches were built in Cherson, among them four luxurious basilicas and a cruciform church. This last was discovered in 1897 and had an altar containing a silver reliquary bearing a monogram, bust, and control stamps of Justinian I. The city seems also to have been a place of exile for prominent persons, among them the pope St Martin (ad 655) and the emperor Justinian II (695). In the 8th century Cherson belonged to the Khazars, but Byzantine rule was reestablished in the earlier part of the 9th century, and for the next three centuries Cherson was again the most important outpost of Byzantium in the northern Black Sea. It became a centre for Byzantine diplomatic, ecclesiastical, and military activity in relation to the peoples of the steppe. Knowledge of them proved to be of great value to the monks Cyril (originally Constantine the Philosopher) and Methodios, who spent the winter of 860/ 61 at Cherson before setting out on their missionary work. In the 10th century Cherson was a focal point for relations between Byzantium and the fledgeling Russian state. It was here that in 988 prince Vladimir of Kiev was baptized by the metropolitan of Cherson and married Anna Porphyrogenneta ("born in the purple"), the sister of Emperor Basil II (976–1025); the prelates of the metropolitanate of Cherson then accompanied the couple to Kiev, where they founded the Russian Orthodox Church. The same Vladimir had shortly before

conquered and destroyed Cherson, because Basil had at first reneged on his promise to send Anna as Vladimir's wife-to-be in return for his help against a mutiny in Cappadocia.

The Byzantines rebuilt Cherson, but it did not fully recover and its strategic importance further dwindled following the Byzantine reconquest of the Danube delta. In 1081 the Seljuk Turks captured Sinope, Cherson's main supplier of wheat, for the first time, and again definitively in 1194. With the fall of Constantinople to the Franks and Venetians in 1204, Cherson lost its main centre of support. For a time this role was filled by the so-called empire of the Great Komnenoi of Trebizond (which had come into being as a spinoff of the disintegrating Byzantine empire), but the establishment of new commercial outposts by the Genoese and Venetians contributed to Cherson's decline. In 1299 the city barely survived a destructive invasion of Tatars and Mongols. Byzantine sources last mention it in 1396; it was finally abandoned some decades later.

Children

For Hellenic culture the family is central and childlessness a catastrophe. Men need children to inherit their property and perpetuate the paternal line, while the primary function of wives has been to fulfil this patrilineal ambition. The childless have resorted to remedies of varying efficacy, from the ancient practice of incubation (documented in inscriptions from the shrine of Asclepius at Epidauros, 4th century BC: *Inscriptiones Graecae*, 4. 2. 121–2) to today's more sophisticated medical interventions, but, since the traditional purpose of marriage is to produce heirs, often the consequence of infertility has been marital separation. Children have been important to Hellenic

society in terms both military and political: in the 4th century BC Dinarchus claimed that a man without legitimate issue could become neither an orator nor a general (1. 71) and in Sparta bachelors were mocked publicly, while temporary relaxations in marriage laws in times of war and depopulation reflect anxieties about maintaining the birthrate.

While Greek culture has regarded unproductive marriage as anomalous, the partible inheritance system (in which an estate is divided among all its legitimate inheritors with no rule of primogeniture) which pertained at ancient Athens and in the Hellenistic and Byzantine worlds, together with the problem of poverty and the obligation to dower daughters, meant that children were not always a blessing. Large families were (and still are) a luxury; Polybius in the mid-2nd century BC claimed that family planning led to prosperity (36. 17. 5). High infant mortality rates due to primitive obstetrics and medical care limited family size, but contraception was largely ineffective (one 4th-century BC Hippocratic text suggests a posset of beans and water: *On the Nature of Women*, 98) and adoption for the ancient and medieval Greeks was not a means of finding a home for unwanted children but of ensuring an heir for the paternal estate, the usual adoptee being a male adult. Indeed at Athens foundling children could not be adopted since the consent of the child's father was needed. Furthermore, while the orphans of Athenian citizens killed in battle were supported at the expense of the state (Thucydides, 2. 45), state-run orphanages that cared for abandoned children did not appear until the Byzantine era, and they were few and far between.

Since contraception was unreliable and celibacy not an option (for pre-Christian Greeks at least), the standard methods of disposing of unwanted children were abortion and infant exposure. Abortion, legal in Greece today, is condemned by Orthodox teaching. However, pre-Christian concerns about abortion centred on the issue of paternal authority and the potential destruction of heirs rather than the sanctity of human life – only fathers (or, if the father was dead, the child's or embryo's agnatic kin) could decide to abort or expose offspring, and the mother who attempted to appropriate this power of decision was liable to prosecution (see Lysias, fr. 8a, 8b). Exposure must be distinguished from infanticide, which in Hellenic society has been almost invariably the object of religious proscription. Infants were left typically in places where people went, and they were intended to be found. The usual fate of foundlings was slavery and, for girls, the brothel. Ambrose suggested that, while the poor practised exposure, the wealthy favoured (or perhaps had access to effective methods of) abortion (*Lex.*, 5. 58). At Sparta the decision to raise a

child belonged not to its father but to the elders of his tribe. “Defective” infants were cast into the Apothetae, a chasm under Mount Taygetus (Plutarch, *Lycurgus*, 16).

Demographic evidence suggests that the Greeks of antiquity practised selective female exposure; a letter of the 1st century BC from a soldier to his wife orders her to expose their unborn baby if it turns out to be a girl (*Oxyrhynchus Papyrus* 744,). Indeed, Greek culture traditionally values sons more highly than their sisters, a partiality that illustrates the radical gender bias inherent in Greek society; at ancient Athens males alone could inherit and for Greeks ancient and modern the engendering of boys is a mark of masculinity. Even at the dawn of the 21st century sons may count for more than daughters; when asked how many children they have, Greek men may enumerate their sons only (see Vermeulen 1970).

The Greek Constitution now insists that both parents share equal rights and responsibilities in parenting (article 4, para 2, 1975) but earlier Hellenic society prioritized paternal authority. At Athens the father acknowledged paternity on the *dekate*, the tenth day after birth, while the formal rejection of an older child was possible (*apokeryxis*). In antiquity, as now, children were legal minors, subject to the authority of a guardian (*kyrios*), normally the child’s father, although at Athens in the Classical period the archon was obliged to appoint a guardian – usually an agnatic male relative – for orphans. The children of divorced parents or widows belonged to their father’s house and the modern assumption that children should live with their mothers in the event of marital breakdown or paternal death represents a radical reversal of ancient practice. Yet the trend has its roots in late antiquity; Byzantine law insisted that stepfathers adopt the children of a wife’s previous marriage.

At Athens sons became their own *kyrioi* when they attained their majority (at about 18), although daughters, being perpetually legal minors, remained throughout their lives under the guardianship of either their male natal kin or their husbands. Although adult sons were legally independent, filial obligations remained strong; honour was due to one’s parents as to the gods and sons could be disfranchised for mistreating their parents (Demosthenes, 10. 40–41; Lysias, 13. 91). In the Byzantine period the Roman law that legally subordinated adult children to their fathers (*hyperexousia*) was accepted by Justinian, and later the *Prochiron* (907) required that sons desiring legal independence should be formally emancipated from paternal power, although Leo VI (886–912) granted legal independence to sons who had established their own *oikoi* (households). Paternal authority persisting into adulthood led to tensions (John Chrysostom claimed that sons preferred their fathers

not to live too long in *Colosseos*, 1.3 – see *Patrologiae Cursus Completa, series Graeca*, 62. 303, edited by J.-P. Migne), yet the threat of disinheritance may have motivated sons to keep on good terms with their fathers – while the legal minimum to be divided among all legitimate sons was one-quarter (later one-third) of the paternal estate, the amount could be divided unequally (Justinian, *Novellae*, 115. 3).

The children of “illegitimate” unions were dealt with variously. At Classical Athens a child was a bastard (*nothos*) if he did not result from a union legitimized by *engue* (betrothal) or *epidikasia* (legal process) in the case of an *epiklirios* (heiress). *Nothoi* born to free Athenian parents were not members of the *oikos* but could inherit a residual portion of their fathers’ estates in default of legitimate heirs; Justinian also allowed illegitimate children to inherit in the absence of legitimate sons (*Codex Iustinianus*, 5. 27. 8). The treatment of children of concubines and slaves underwent various changes; at Athens in the 5th century BC the children of citizens and free alien concubines could perhaps be legitimized, although this was no longer possible in the 4th century BC. Children of citizens and slaves, however, were slaves and belonged to their owners. In the Byzantine period Constantine insisted that children of freed-men and slave women remain slaves (*Codex Theodosianus*, 12. 1. 1, 4. 8. 7), although later Justinian rendered such children automatically free unless this was proscribed by the father’s will. In 479 Zeno legitimized automatically children of free men and free concubines, a law extended by Justinian in 539 to embrace children of slave concubines. Children born of two slaves were throughout the period owned by their parents’ masters. In post-Solonic Athens the law debarred parents from selling their children into slavery (Plutarch, *Solon*, 23. 2) and Byzantine children could be neither sold nor abandoned, although in 329 Constantine legalized the sale of children with the right of later repurchase.

Ancient literary representations of children begin with that of Astyanax in the *Iliad*. Erinna mentions little girls who play with dolls and are afraid of the “bogeywoman” Mormo (*Distaff, Greek Literary Papyri*, 3. 120, 4th century BC), while the death of children, from the horror of infanticide (Euripides’ *Medea* and *Hercules Furens*) to the accidental death of 119 schoolchildren on Chios (Herodotus, 6. 27) evokes pathos and often signifies the end of the paternal line. *Choes* (pitchers) of the Classical period and Hellenistic art exhibit a particular interest in children, while Christian iconography frequently represents the infant Jesus.

In antiquity children were considered wild (Plato, *Timaeus*, 44a–b). Education was essential to “tame” children and to prepare them for adult roles and responsibilities – politics and war for boys, marriage

for girls. A child's first learning experience was at home where the women of the household played an important part in the transmission of culture through storytelling and religious instruction (Plato, *Laws*, 887d–e). Many mothers took their children's education seriously – in the 2nd century AD Plutarch mentions a mother educating herself in order to educate her children (*Moralia*, 14b–c) and advises that wetnurses, who in the past, when weaning occurred at the ages of 2 or 3, exercised a significant influence on their charges, should be Greek-speaking and of good character (*Moralia*, 3e). Boys were removed from the sphere of female influence at 7 or 8. The Spartan *agoge* (education system) separated boys from their families at the age of 7, while elsewhere boys whose families could afford it were educated at schools where Homer and, later, Christian texts such as the Psalms formed the basis of a literary education, although many Christians such as Basil of Caesarea found pagan texts morally problematic as a didactic tool. Military training was crucial for boys and institutionalized homosexuality was an educational feature of many Greek states including Sparta (Xenophon, 2. 12) and Dorian Crete (Ephorus, fr. 70. 149). Physical education at the gymnasium and social education at the symposium were usually the province of boys, but music and dancing were common to both sexes; Alcman and Sappho in the 7th century BC attest to girls' choirs. However for girls education was essentially domestic: spinning and weaving were taught at home and up to recent times girls had limited access to formal education. Indeed, until the late 20th century Greek families financed the education of their sons but seldom that of their daughters.

The children of the poor and slaves worked at home, on the land, or at a trade; a papyrus from the Hellenistic period documents the case of a slave child apprenticed to a weaver (*Oxyrhynchus Papyrus* 1647). Childhood was short for many children in the past; girls were married young (although *Peira*, 49. 22 describes penalties for those who married girls under 12) and in the mid-7th century 10 was the minimum age for taking monastic vows. The 20th century has seen the extension of childhood into late adolescence as a much greater proportion of children, girls as well as boys, remain in education longer, while the minimum age for marriage in Greece is now 16 (18 without parental consent).

Chios

Island in the eastern Aegean

The island of Chios has been inhabited almost continuously from the Stone Age to the present day. This it owes at least in part to its fertile soil and to its geographical position, located in the eastern Aegean just off the coast of Asia Minor, from where over countless centuries it has been able to exploit the trade routes north to the Hellespont and the Black Sea and south, west, and east to the Mediterranean, the Levant,

and Egypt.

The earliest evidence for human habitation comes from the cave site of Ayio Gala in the northwest of the island, and dates from the early Neolithic period in the 6th millennium BC. In the 5th millennium BC a settlement was also established at Emporio in the south, and continued in almost constant use through the Early, Middle, and Late Bronze Age. Then around 1100 BC Emporio, in keeping with other Mycenaean sites all over the Aegean, suffered catastrophic destruction by fire and abandonment by its population. Our understanding of the subsequent Dark Age period is confused, though probably around 1000 BC the island was colonized by Ionian Greek-speakers arriving from the west.

By the 8th century BC Chios shows evidence of increased activity, including the refoundation of a settlement at Emporio, the existence of a religious sanctuary at nearby Kato Phana, and clear indications of active overseas trade. The 7th century BC was a time of great expansion and development for the island, in terms both of its mercantile trade and also of its external cultural and political relations. Together with other Greek cities, it founded the trading station of Naucratis in Egypt and, joining with 11 other cities in the eastern Aegean, established the Panionium or league of Ionian states. By the Archaic period the island was united under the control of Chios town, situated in the middle of the east coast. This was a time of great prosperity, when Chios emerged as one of the leading naval powers in the Aegean. Its products of gum mastic, turpentine, decorated pottery, fine cloth, figs, and wine were exported widely throughout the Aegean and beyond. So famous, indeed, was its wine that Chian coins were recognized by their emblem of the wine amphora. In addition to its commercial activities, Chios also became renowned for its school of sculptors: Chian artists such as Archermus, Bupalus, Micciades, and Glaucus exerted a strong influence on Archaic Greek sculptural style and were much sought after for their work. Also by the 6th century BC Chios had firmly established itself in the Greek poetic tradition: claiming to be the birthplace of Homer, a claim strongly contested by neighbouring Smyrna, the island became home to the Homeridae, a school of rhapsodes who asserted their descent from Homer himself. In the Classical period, too, Chios' influence on the arts and learning remained strong: the tragic poet Ion, the historian Theopompus, and the sophist Theocritus all numbering among its sons.

Chronicles

By convention, history writing can be classified as either annalistic (composed of brief annual entries) or narrative. The ancient Greek world provides the earliest European examples of both, on the basis of which the Greek-speaking medieval world of Byzantium developed Christianized varieties. Byzantine-style chronicles proved remarkably long lasting.

The earliest known Greek historical records are lists of public officials, such as the priestesses of Hera in Argos, the Athenian archons, or of victors in festivals, such as the Olympic Games. Such lists were kept in each community for local purposes and provided a basis for noting events of local significance. These were the first forms of chronicles. With the establishment of the multinational Hellenistic kingdoms in the wake of the conquests of Alexander it became of

interest to establish synchronicities; hence the work of Timaeus (c.350–260 BC) and Eratosthenes (c.285–195 BC) on Olympic victor lists, which could function as a universal chronological framework within which significant events could be placed. The Parian Marble (of which two fragments survive, one in the Ashmolean Museum, Oxford, the other in the Paros Museum) lists a mixture of political, military, religious, and literary events from Cecrops, the first king of Athens, onwards, dated synchronously but correlated backwards from the archonship of Diognetus in Athens (264/63 BC, presumably the date of composition). Significant lists of rulers and dynasties, forerunners of the fully fledged chronicle, were compiled by such men as Apollodorus of Athens (c.180–120 BC), Castor of Rhodes (1st century BC), Manetho of Heliopolis (fl.280 BC), and Phlegon of Tralles (fl.AD 140).

These works of pagan late antiquity formed the background against which the (now lost) Christian *Chronicle* of Eusebius of Caesarea was written (two editions: before AD 303 and 325/26). Eusebius synchronized Old Testament and Graeco-Roman history into a continuous chronological sequence calibrated by years from Abraham and, from 776 BC onwards, by Olympiads. The Greek Eusebius has not survived. The work was in two parts, raw lists (surviving only in an Armenian version) and the chronicle proper (best preserved in Jerome's highly influential Latin translation). Its purpose was to demonstrate that God's plan for man's salvation encompassed the whole of history. Eusebius established a genre, the Christian world chronicle, which was to have a long history in the subsequent Byzantine centuries, though little has survived of his immediate successors (such as the Egyptian monks Annianus and Panodorus).

Chronology

By "chronology" we mean the division of time, the ordering of events and the intervals between them on a fixed scale. The natural world has three ways of marking the passage of time: the daily cycle of night and day, the monthly cycle of the moon, and the annual seasonal cycle of the sun. The ancient and medieval Greek world had several ways of marking the succession of days in the month or year and the sequence of years, and of dating historical events whether within a short or a long time-span.

From at least the 5th century BC the full day was divided into night and day, each of 12 hours whose length varied according to season and latitude. Hours could be measured by a sundial or waterclock, but for most people internal divisions of the hour remained imprecise, though considerable precision could be achieved for astronomical calculations.

The week is an artificial temporal division not used in the ancient world. In the Greek-speaking world of the Christian east Roman empire a seven-day week, originally Hebrew but then Christianized, came into use. Each day had a mystical and liturgical symbolism sometimes apparent in the names (e.g. Paraskeve, Friday, "preparation").

By the 5th century BC Athenian astronomers had become aware that the lunar month was 29.5 days long and the solar year 365.25 days. There was no universal calendar and each Greek community used its own month names and individual date for the new year. The months were normally named after the festivals that fell within them, or after a deity. In the Byzantine world local month names remained predominant until late in the 5th century AD, but thereafter the Roman month names (Ianouaraios, Febrouarios, etc.) gradually prevailed.

In the Graeco-Roman world of antiquity prior to the reforms of Julius Caesar (44 BC) the calendar year was frequently at variance with the seasonal and solar year, despite the addition (intercalation) of days and months at irregular intervals, often for political rather than calendrical reasons. After the reform the year consisted of 365 days with one day inserted in the month of February every fourth (leap) year, a system that remained in force generally until the reforms introduced by Pope Gregory XIII in 1582 (the Gregorian calendar), which removed leap-year status from century years, except for those divisible by 400 (e.g. 1600, 2000 etc.).

Between Meton (*fl.* 432 BC) and Ptolemy (writing AD 146– 170) an

increasingly precise understanding of the lunisolar cycles was developed, giving rise to accurate predictions of eclipses, and also enabling public calendars to be set up that traced the movements of constellations throughout the year. In the Christian Byzantine empire lunisolar cycles were used to calculate the date of Easter (the results usually presented in paschal tables) and also to extrapolate to the date of Creation.

Dating of events in the short term in the ancient world (for legal documents, government decrees, some historical events) was normally by the year of the priest or magistrate into which they fell (e.g. Athenian archons, Roman consuls). Dynasties might be calculated roughly in terms of human generations. In the wake of the conquests of Alexander and the establishment of the Seleucid empire, a more precise reckoning by the Seleucid era (beginning from 312/11 BC) became widespread, together with an interest in establishing the synchronicity of rulers and events. Timaeus (mid-4th century–late 260s BC) constructed a synchronous list of Olympian victors, Spartan kings and ephors, Athenian archons, and priestesses of Hera; thereafter it became customary to date historical events in a longer perspective by years of the Olympic Games, i.e. by Olympiads. Eratosthenes in the 3rd century BC further refined these lists and replaced a mythical prehistoric chronology with one based on what was believed to be the historical date of the fall of Troy (1183/82 BC). Other eras were also used, notably one calculating from the foundation of Rome (753 BC).

Cilicia

Region of southern Asia Minor

Cilicia commonly (but not invariably) names the area of southern Turkey bounded by the river Melas (Turkish Manavgat) to the west, the Taurus to the north, the Amanus as far south as Cape Rhosus (Hinzir Burnu) on the gulf of Issus to the east, and the Mediterranean to the south.

West of the river Lamus (Lamas) Cilicia is mountainous and the coastline mainly abrupt; it was named “rough” (Greek Tracheia); to the east as far as the Amanus it is a fertile plain (hence Greek Pedias). The mountainous mass of Rough Cilicia, jutting out into the sea, threatening not only Pedias but also the Pamphylian plain to its own west, difficult to penetrate or pacify, is a defining feature of Cilician history. Another is the location of Pedias on a main land route between east and west.

The Cilicians were an Anatolian people; Hittite and neo-Hittite sites have been uncovered (strikingly at Meydancik Kale near Gülnar and at Karatepe). Greek settlement began in the Archaic period at coastal sites in Tracheia (e.g. Kelenderis, Nagidus, Soli). Later legend attributed some native cities (Mallus, Mopsuestia, Olba, Tarsus) to Greek foundation in the heroic age. What history underlies this is obscure; a name resembling Mopsus (who figures in the legends) is borne by an ancestor in a royal inscription of the 8th century BC at Karatepe.

There were native kings at Tarsus under the Persians until the early 4th century BC. After Alexander's conquests control was disputed by the Seleucids and the Ptolemies. At first the whole was probably Seleucid; two of Seleucus Nicator's lasting monuments, Seleucia ad Calycadnum (Silifke) and the temple of Zeus at Olba, are in Tracheia. But by the middle of the 3rd century Tracheia had Ptolemaic garrisons which were ejected in 197 BC.

Seleucid weakness resulted in the pirate “kingdom” in western Tracheia around 140 BC. With the connivance or tolerance of other states the pirates grew in strength; only in 101 BC was a Provincia Ciliciae (which did not include Cilicia) created by Rome to deal with them. For the next 30 years efforts were unsuccessful. Meanwhile in 83 BC Pedias was conquered by Tigranes of Armenia. A pirate raid on Ostia in 68 BC provoked a decisive response from Rome in the appointment and successful campaign of Pompey the following year. Tigranes also withdrew from Pedias. Pompey resettled pirates in the cities of Pedias and eastern Tracheia (including Soli, refounded as Pompeiopolis) and organized Pedias as a group of city states; rougher territory to the east was handed to a local dynast, Tarcondimotus. A policy of leaving such territory to clients endured until the Flavian period.

The Provincia Ciliciae of 64 BC extended beyond Cilicia proper. Between 58 and 47 BC it included Cyprus, and between 56 and 49 BC stretched to Phrygia. Around 44 BC Pedias became part of the province of Syria. Soon after, Tracheia (excluding the free city of Seleucia) was given to Egypt. It remained under client kings for about a century after Actium (Amyntas of Galatia to 28 BC, Archelaus of Cappadocia and his son, also Archelaus, to AD 38, and finally Antiochus IV of Commagene to AD 72). The kingdom of Olba in eastern Tracheia remained under the native dynasty until AD 41 when it was given to Polemo II of Pontus. A number of cities of Tracheia were founded in this period, perhaps with civilizing intent; Titiopolis and Domitiopolis probably by Cleopatra; Iotape, Irenopolis, Germanicopolis (still Turkish Ermenek), and Philadelphia by Antiochus IV; and Claudiopopolis (Turkish Mut) by Polemo II. Two uprisings by the tribes (in AD 36 and 52) were serious enough to be recorded by Tacitus and needed Roman troops for their suppression.

In AD 72 Vespasian deposed Antiochus IV and united Pedias and Tracheia (except its western fringe) in a single province of Cilicia. Then they were divided again (perhaps in the mid-2nd century). Tracheia was thenceforth known as Isauria. In the second half of the 3rd century there were uprisings of the Isaurians and invasions by the Persians who in 260 advanced as far as Corycus and subsequently as far as Selinus. In the Diocletianic reform the province of Cilicia was subdivided, with Cilicia I having its capital at Tarsus and Cilicia II at Anazarbus. Both Cilicias and Isauria were part of Oriens and later were ecclesiastically subject to Antioch.

Cimon c.510–c.450_{BC}

Athenian aristocrat

Cimon has not been as well served by ancient tradition as some of his slightly older or younger contemporaries, because his era of dominance at Athens fell slightly after Herodotus' period of focus, but slightly before that of Thucydides. Plutarch's *Life of Cimon*, which contains most of what we know of him, is much shorter than his *Lives* of Themistocles or Aristides. Although Plutarch did not lack sources, it is evident that Cimon's personality did not generate as much interest in later generations as those of his more intriguing adversaries Pericles and Themistocles.

A relative of Thucydides, Cimon was from a very distinguished Athenian family, the Philadae. He was the son of one of its most distinguished members, Miltiades, who, as ruler of the Chersonese, had promoted Athens' colonial ambitions keenly until his support for the Ionian Revolt so angered the Persians that he was forced to escape to Athens (493_{BC}). The climax of his career was his generalship at the Battle of Marathon (490_{BC}), but his subsequent campaign against Paros for its Persian sympathies was a failure. At the instigation of Pericles' father Xanthippus, he was fined 50 talents, but died from a battle wound before he could pay it. Cimon inherited not only his father's debt, but also his policies of hostility to Persia and Athenian imperial expansionism.

After an impressive performance at Salamis, Cimon was made an Athenian envoy to Sparta in 479_{BC}, and his name is associated with the most important campaigns of the early Delian League, from 478_{BC} to 463_{BC}, working with its organizer Aristides, who is said to have championed the young Cimon as his ally against Themistocles. In 478 the Spartan general Pausanias was still in charge of the Greek forces, but according to Athenian tradition his arrogance began to alienate them, and they were won over by the kindness of the Athenian generals. Once the Spartans recalled Pausanias on a charge of treason, control over the anti-Persian operations was definitively ceded to Athens, thereby laying the foundations for Athenian dominance over the Aegean during the 5th century_{BC}. Acquitted, Pausanias took Byzantium, but he was driven out by Cimon himself, who then triumphed in his father's old stamping ground by removing Eion in Thrace from Persian hands (476/75_{BC}). Soon after this, he won Scyros for Athenian colonists and, in an effective personal coup, returned the alleged bones of Athens' national hero Theseus to the city for burial, to great acclaim. Sources do not explicitly say that he led the early campaigns of the league to crush allied rebellion, at Carystus and Naxos (473–469_{BC}), but his usual enthusiasm for Athenian expansion

makes his presence there very likely.

Soon after Naxos the Athenians undertook a major campaign in the southeast Aegean, perhaps to mollify allied discontent at their use of the league to police its own members. Cimon's greatest triumph followed at Eurymedon in Pamphylia (c.468 BC), when his troops wiped out the Persian fleet, and cities as far east as Phaselis joined the league. His generalship brought material wealth to Athens, and an immense sense of pride to a city that had been sacked by the Persians only some 12 years earlier, but was now carrying vengeance right into the Great King's territory. Cimon's comprehensive victory may be said to have paved the way for the Peace of Callias, c.450 BC, whereby Greek freedom from Persian interference was finally secured.

At this time, however, Cimon continued to pursue the Persians relentlessly, returning to the Chersonese and driving out those who remained, before besieging the Thasians who had now seceded from the league (465–463 BC). The Spartans, actively working against their former allies in the Persian Wars, had promised the Thasians that they would help them by invading Attica, but an earthquake and a helot revolt frustrated this plan. Meanwhile, Cimon crushed Thasos and returned to Athens, to be prosecuted (unsuccessfully) by the up-and-coming Pericles on a charge of bribery for having made no territorial gains in Macedonia. Unlike Pericles and others, Cimon clung to the old view that Sparta was Athens' partner, not its rival in Greek leadership (in spite of his service in the expansionist Delian League), and in 462 BC he persuaded Athens to help the desperate Spartans. It was perhaps while he was away that Ephialtes introduced the democratic reforms that took most jurisdiction away from the Areopagus and gave it to the people's courts instead: whether or not this was the cause, the Spartans decided that the Athenian army could not be trusted not to help the helots, and sent them away. This ignominious dismissal severely damaged Cimon's credibility in Athens, and, after a failed attempt to reverse Ephialtes' work, he was ostracized in 461 BC. Athens also broke irrevocably with Sparta by allying with its enemy, Argos.

Cimon's next known action was to patch up relations between Athens and Sparta with a five-year truce, c.451 BC. The two cities had been testing one another's strength throughout the decade, at the battles of Tanagra (won by Sparta) and Oenophyta (won by Athens), and after the loss of 200 Athenian ships in Egypt in 454 BC, both sides were ready for a brief respite. It seems clear that Cimon still hankered after the past when Sparta was an ally, not an enemy, and his last campaign was also a throwback to the 470s BC. He mounted another expedition to Persia to recapture Cyprus, but he died there, and aggressive Athenian expansion in the east ceased thereafter.

The sources, perhaps derived from Critias, say that Pericles instituted jury pay in order to counter Cimon's personal generosity. Cimon's family was wealthy anyway, and his huge campaign revenues brought him popularity as he opened up his estates to the poor, and gave them public dinners and financial handouts. Payment became necessary after the Ephialtic reforms, which brought a greater volume of business to the democratic courts, so that larger issues of practicality rather than small-scale politicking may have caused Pericles' move, but it is certainly true that Pericles opposed the traditional, almost feudal patronage practised by those from rich families, such as Cimon's, because this was damaging to democracy. A number of artefacts associated with Cimon indicate that he was keen to assert himself in a traditionally aristocratic manner: the Painted Stoa, commissioned by his brother-in-law, bore a picture of Marathon in which Miltiades was prominent, and a Delphic dedication associated a statue of Miltiades with those of Athena, Apollo, and the Athenian tribal heroes. By rehabilitating his father, Cimon augmented his own status as the inheritor of Marathonian glory over that of Themistocles, whose victory had been Salamis.

There is, therefore, some truth in the schematizations of later sources that pit Cimon the conservative against Pericles the democrat. His foreign policy was conservative in that it was based on traditional Greek affiliations at a time when new alignments were beginning which would lead to the Peloponnesian War. The names of two of his sons – Lacedaemonius and Eleius – are revealing. In other ways, however, he was as imperially minded as Pericles, leading the campaigns that created the Athenian empire, encouraging the Athenian naval activity that later writers associate with radical democracy, and vigorously opposing secession from the league. Both he and Aristides, though not as brilliant as Themistocles, played a huge part in the creation of 5th-century democracy.

SOPHIE MILLS

Biography

Born c.510 BC to a noble Athenian family, Cimon was the son of Miltiades, ruler of the Thracian Chersonese. As a general he actively pursued the war against Persia but was keen to retain Sparta as Athens' partner, not rival, in leadership of Greece. He was ostracized in 461 BC but recalled in 451 to mend fences with Sparta. He died soon after in Cyprus, attempting to recapture that island from Persia.

Cities

What is a city? Is it a community of buildings or a community of people? According to Aristotle, it is not a community of buildings but of people. For one could, for example, “enclose Megara and Corinth in a wall, yet they would not be one city”. “But a city”, he continues, “is a society of people ... not ... founded for the purpose of men’s merely living together, but for their living as men ought” (*Politics*, 3. 9). On the other hand, when Pausanias, the 2nd-century AD traveller, came upon a little place in Phocis, he hesitated to call it a “city” (*polis*) as it possessed “no government offices or gymnasium, no theatre or agora or water flowing down to a fountain” (10. 4. 1). Gradually, “city”, which is at the root of the word “civilization” (*politismos*), came to encompass both the buildings and the people of a permanent settlement.

In Mesopotamia evidence of permanent village agriculture dates back to 8000 BC and temple cities and city states date from 3500 BC. In Greece the earliest settlements were the Minoan (2000–1400 BC) and Mycenaean (1600–1050 BC) palace centres. At about 800 BC Archaic Greek societies began developing permanent city structures. While the Greeks did not invent the city as a form, they established it as a political institution. The polis, as an independent city state and a community of self-governing citizens, emerged in the Greek world in the 8th century BC. Its democratic underpinnings, governed by equality of all under the law (*isonomia*), were contrasted with the monarchical and despotic institutions of contemporary cities in Mesopotamia, Egypt, and the Persian empire.

Greek cities originated either from small villages that grew gradually, from several villages that came together to form a community (synoecism), or from colonial settlements. Athens was allegedly formed through synoecism. Colonial settlements, on the Ionian coast (modern Turkey in Asia Minor) and on the south Italian peninsula, were founded for purposes of commerce and retained ties to the mother city in mainland Greece. Many of the new settlements were planned on an orthogonal grid, while cities that evolved over time usually exhibited an irregular, “organic” street plan. Athens, established in Mycenaean times, had an “organic” street plan that was first set out in the Archaic period. Miletus, on the coast of modern Turkey, was planned on an orthogonal grid by Hippodamus in 479 BC, following its destruction by the Persians in 490 BC. Though the ancient

Greek cities possessed some of the characteristics associated with urban environments today – high concentration of population, division of labour, trade with other cities – they were all heavily dependent on agriculture. The connection of the city to the countryside remained most vital until the 20th century.

Of the approximately 700 cities of the Greek commonwealth in the Classical period, Athens was the largest and most famous. Public life took place in the Agora – the ancient civic centre and marketplace – while the city's tutelary goddess Athena was honoured by the Periclean building programme on the Acropolis: the Parthenon (447–432 BC), the Erechtheum (421–405 BC), and the temple of Athena Nike (427–424 BC). In contrast to the magnificence of the public building programme, residential architecture remained humble and inward looking. In the Classical Greek city no individual, no matter how powerful, could attach his name to the new civic structures, as it was the state and the citizens themselves (the free, male residents) who commissioned and paid for all public buildings. That changed during the subsequent periods, when Hellenistic rulers and Roman emperors endowed several of the Greek cities with larger and more luxurious public buildings that bore their names: the stoa of Attalus, Hadrian's library, etc. These private donations eroded the democratic ideals of the Classical polis whereby all men enjoyed equal footing. This practice of privately funded civic structures, named after wealthy individuals or corporations, similarly marks the urban landscape today.

The insularity of the Classical Greek city states, which often resulted not only in competition but also in warfare among them, was transformed in the ensuing Hellenistic period. As a result of the successful military campaigns of Philip II of Macedon, most of central and southern Greece became subjugated to the Macedonian kingdom. Philip's son, Alexander III the Great, undertook a campaign of expansion to the east, creating a kingdom that stretched from Cyrene in North Africa to India. As Alexander considered his mission to be a civilizing one, albeit imperialist, he founded several new cities, thus spreading the Hellenic language and culture across much of the known world. These cities were normally laid out in a grid pattern, adjusted to the existing topography in each case. While their building programme was based on the Classical Greek city – with an agora, temples, theatres, and other civic structures – their political system differed drastically. Whereas the classical Greek city was, at least in principle, politically autonomous, the Hellenistic city was a dependent member of an extensive empire. Alexandria in Egypt, the first and greatest of Alexander's cities, was founded in 332 BC. It soon became one of the most important trading centres of the Mediterranean, and

an eminent centre for culture and philosophical studies, its Neoplatonic schools eventually rivalling the philosophy schools of Athens. “Alexandria is situated, as it were, at the crossroads of the whole world, ... bringing together all men into one place, displaying them to one another, and, as far as possible, making them of the same race”, wrote Dio of Prusa in his *Alexandrian Speech* (c.AD 69/79). Thessalonica, founded in 316 BC, also rose to prominence under Roman rule, becoming the capital of the Roman province of Macedonia and an important military and commercial centre. It maintained its commercial and administrative importance in the subsequent Byzantine and Ottoman periods.

Greece became a Roman province in AD 146, after a war in which the Romans destroyed Corinth. Under the Roman empire Athens, though now a provincial city, still enjoyed a special status as a result of its cultural eminence. While its political significance atrophied, its physical image was enhanced by the new buildings endowed by the various emperors and high-ranking Roman officials. A resurgence of its philosophy schools in the 4th and 5th centuries infused new blood into its economy, until the emperor Justinian ordered their closure in AD 519, condemning Athens to obscurity.

The next major city to rise to prominence in the Graeco-Roman world was Byzantium, a Greek merchant settlement founded at the end of the 8th century BC on the shore of the Bosphorus. Chosen by emperor Constantine the Great (307–337) as a capital of the eastern Roman empire, it was aggrandized and inaugurated in 330 as Constantinople. Constantinople was endowed with a unique triple identity: Greek, Roman, and Christian. Hailed as “the New Rome”, its political, legal, and building structure certainly justified that claim. Also part of that structure, however, were the earliest layers of its Classical Greek and Hellenistic foundation, and its newly acquired Christian identity. Constantinople became the centre of the Byzantine empire, diffusing its imperial, religious, and commercial power over a vast territory. It reached its zenith under the reign of Justinian I (527–65), maintaining a key role until the period of the Latin rule (1204–61). The weakening of the Byzantine empire finally led to the fall of Constantinople in 1453 to the armies of the Ottoman sultan Mehmet II.

City State

The city state (polis) was the prevailing political, cultural, religious, and social system among the Greeks from c.800 to c.300 BC. The map of ancient Greece was a mosaic of city states; each was independent, but some were linked with others by ties of kinship and military alliances.

The term "polis" originally apparently meant something like "the villages around". The Greeks used the term *synoikismos* to describe the unifying of the houses in the countryside (*oikoi*) and villages (*komai*) into a constitutional system (*politeia*). Most city states had an acropolis (a high city), a fortified area on a high rocky promontory overlooking the surrounding countryside, which served as a place of refuge in times of danger.

Geography was a factor in the rise of the city states, because the numerous islands of Greece, the very mountainous terrain of the mainland, and the isolation of small plains favoured small local units of government. Another factor was the collapse of kingship late in the Dark Ages; by the historical period most city states were ruled by councils controlled by aristocrats.

The territory of each city state was small. Some were only a few kilometres square: Athens with 2600 sq km of territory and Sparta with 8400 sq km were among the largest. Physically the city state might look urban or be composed of villages without walls, as at Sparta. The population was generally small. Slaves and foreigners (metics) were excluded from citizenship, while women, children, and sometimes "the dwellers around" (*perioikoi*) were classified as second-class citizens. The full citizens (*politai*) of the polis were all males over the age of 18. Their births would be registered with the traditional brotherhood (phratry). Regardless of its location, the male citizens were the essence of the city state. They composed a corporate body,

ordered by the principle of citizenship, which could be housed anywhere. All were expected to serve in defence of the city state.

The city states were varied and numerous, eventually numbering perhaps as many as 1200 or more. Their constitutions and history largely remain unknown. The Aeolian-, Ionian-, and Dorian-speaking Greeks developed different styles of city states; Athens and Sparta are the best known of the Ionian and Dorian types, respectively. Most of ancient Greek history is known through the histories of these two, the most famous; but other important ones included Corinth, Syracuse, Miletus, Ephesus, Thebes, and Chalcis. Tribal and cultic differences marked the city states with a jealous particularism. Most were isolated in small farming valleys with their own local shrines, laws, and dialects.

By the mid-8th century ^{BC} population increases led to the foundation of numerous colonies all around the Mediterranean, but especially on the shores of the Black Sea, in southern Italy, and in Sicily. Each of these usually became an independent city state. Sometimes the new colony was founded by two or more mother cities.

The government of most city states changed over the centuries. By the Archaic period most were ruled by aristocrats in a council, but an assembly of citizens and magistrates also participated in governing. In Athens the earliest council was the Areopagus, made up of elder statesmen; the members, archons, served for life. By the end of the 7th century ^{BC} growing tensions between the aristocrats and citizens from the lower orders, in Athens and other city states, often developed into class conflicts. When Solon was elected archon of Athens in 594 ^{BC} he began a programme of political reform that was to lead eventually to the establishment of Athenian democracy at the end of the 6th century ^{BC}.

Sparta resisted all reform and maintained an oligarchy based upon the laws of Lycurgus, which had organized the people into Spartiates (citizens), *perioikoi* (non-citizens with some rights), and helots (state serfs). There were two kings, elected from two royal families, who exercised limited power; one stayed at home and the other led the army into battle. Sparta was governed by five officials called ephors, elected to one-year terms by citizens, with the aid of a council. There was also a citizen assembly (*apella*).

War, an incessant feature of life, robbed the Greeks of their strength. During the Classical period cooperative efforts were made to limit the jealous particularism through leagues. While most were military alliances, some leagues served trade needs, and even managed some of the games. They included the Aetolian League, Boeotian League, Chalcidic League, League of Corinth, Delian League, Second Athenian League, Achaean League, Ionian League, and the

Delphic Amphictiony, which managed the Pythian Games.

The sovereignty of the city states ended with the conquest of the Greeks by Philip II of Macedon in 338 BC. After the conquests of Alexander the Great, Graeco-Macedonian kingdoms were established throughout the empire. The individual Greek city states were never again strong enough to regain their original power.

Classical Period c.479–323_{BC}

The Classical period of Greek civilization is framed by wars: at the beginning was the great conflict with the Persian empire culminating in the defeat of Xerxes' invasion of 479_{BC}; at the end was the war between Philip II, king of Macedon, and the alliance of Athens and Thebes, followed by the conquest of the Near East by Philip's son Alexander the Great. Undoubtedly these circumstances influenced the character of the period, though they are only one factor in its complex form. The period also witnessed the greatest achievements of the Greek city state and its varied political systems: in essentials, this was marked by the triumph of the voluntary cooperation of the free citizens who constituted these small communities over the monolithic and massive resources of an absolutist, autocratic empire. At the same time, however, the city state contained the seeds of its own decline. The need to build a larger political organization strong enough to continue the combat against the Persians led to empire and hegemony within the Greek states themselves (particularly that of Athens, which dominated the first half of the period), and the subsequent rivalry and quarrels that weakened that unity following the great war between Athens and Sparta, and their resulting collective weakness in the face of the aggressive monarchy of Philip II.

Classical art and literature grew out of the developments of the preceding Archaic period, though political success engendered a new confidence. It is noticeable in the fine arts, in both sculpture and (in so far as the evidence for it has survived) painting. Already in the late Archaic period sculpture had been evolving away from its oriental- (and particularly Egyptian-) derived formalism towards greater naturalism. The stiff, formal poses of the Archaic marble statues give way to more complex ones made possible by the rapid development of hollow cast bronze. Indeed, the extremely elaborate poses of some early Classical statues, such as the *Discus Thrower* of Myron, seem specifically to illustrate their freedom from the restraints previously imposed by the marble block. This phase passed, and Classical sculpture is marked essentially by a relaxed, yet idealized, naturalism. But what were by repute its greatest achievements, the lost statues of gold and ivory (fixed on a wooden frame) made by Phidias as the focus of worship in the temples of Athena on the Acropolis of Athens and of Zeus at Olympia, must have had an awesome majesty and formality that transcended any natural representation.

Much of this sculpture was produced to satisfy the demands of official patronage rather than the private individual. Statues were set up as thank-offerings for victory, or to express the religious needs of

the community, rather than as monuments to the prestige and power of ruling families. The city, the community, commissioned them, and the art reflected, very often, the political agenda set by the community itself. Not all of this was the triumphant militarism typified by Phidias' colossal bronze of *Athena the Champion* that dominated the Acropolis of Athens, and which was prominent enough to serve as a landmark to guide ships approaching the harbour of Piraeus, more than 6 km away. More subtle, and echoing the changed circumstances of the 4th century BC, was the personification of *Peace* and her infant *Wealth* made by Cephisidotus (of which later copies survive), while a surviving original bronze of *Athena*, plausibly attributed to the same sculptor, though armoured, seems to present no threat of military aggression. The emphasis, more and more, is on humanity, as in the *Hermes Playing with the Infant Dionysus* by Praxiteles, Cephisidotus' more famous son, which was found at Olympia and often thought to be an original, not a copy. But in many ways the logical and most influential development of Classical sculpture is seen in Praxiteles' *Aphrodite*, sensational in its own day on account of its nudity, and a forerunner of an endless sculptural interest in the naked female form (and, in this case, supposedly modelled not on an imaginary goddess but on the sculptor's own mistress).

Despite this, sculpture was very much a public art, and even the *Aphrodite* was purchased by the people of Cnidus in Asia Minor, to be set up there in a sanctuary of the goddess, where the statue became a tourist attraction. Statues were placed in religious sanctuaries and in public places such as the agora, a term better translated as the civic centre rather than the marketplace of the Greek cities. Sculpture also adorned public buildings, particularly temples, which, continuing the conventions of the Archaic period, carried relief decoration on their friezes, and sculpture in the round in their pediments, the supreme examples of the Classical period being the temple of Athena, the Parthenon, on the Acropolis of Athens, and the slightly earlier temple of Zeus at Olympia. Certainly at Athens, and in all probability at Olympia, this work did not simply pay tribute to the gods, but at the same time celebrated victory over the barbarian, the Persian invader. It is typical of the Classical attitude, however, that it did this by allegory (for example, Greeks defeating legendary Amazons) rather than by direct representation, an indication that the Greek approach was now radically different from that of the Near Eastern predecessors.

Painting, we know, was used to decorate public buildings, such as temples, porticos, and feasting rooms, such as at the entrance (Propylaea) to the Athenian Acropolis. Executed on wooden panels or plastered walls, it was essentially a fragile medium and is now largely

lost. Decorated vases, their pictures fired in the kiln, give us some idea of developments – the move towards greater realism, perhaps in advance of sculpture, and the illusion of three dimensions and depth. The panel-painting technique of colour wash on a chalky white ground was used briefly in the last part of the 5th century BC in a special category of vase, made to be deposited in graves; the best illustrate the freedom that artists had then mastered. In 1977, the unearthing of the tombs of Philip II and other members of the Macedonian royal family revealed wall-paintings of dazzling mastery that anticipate uncannily the achievements of Renaissance artists, in the sense of liberation from long traditions and conventions: such work clearly went on to inspire artists in the Hellenistic and Roman periods.

Architecture was firmly rooted in the forms of the Archaic period – superficially, there is no great difference between the Doric temple of Artemis at Corcyra, of the early 6th century BC, and the Parthenon, the greatest Doric building of the 5th century BC. Developments can be seen in the improvement in technique, particularly the use of marble, and the refinement of detail. Yet there is more than this. Though it is not easily noticed by the naked eye, the Parthenon represents the application to building design of a rigorously thought-out sequence of mathematical proportions, particularly in the ratio of 4:9, that is 2 squared to 3 squared. It is in mathematics that some of the greatest advances of the Classical period can be discerned. Despite having – or perhaps, by virtue of having – hopelessly cumbersome numerical systems, the 5th century BC was the time at which the Greek interest in mathematics became fully awakened, not surprisingly through geometry, ratio, and proportion rather than arithmetic. Sculptors such as Polyclitus saw the ideal of human beauty in the mathematical relationship between the different parts of the human body. The mathematicians of the Classical period constituted a discipline that has continued uninterrupted, through the succeeding Hellenistic and Roman periods, inspiring the Arabic mathematicians of the Middle Ages, and on to the present day. Thus the work of the 4th-century mathematician Eudoxus of Cnidus was incorporated by the Hellenistic Euclid into his fundamental textbook, the *Elements*, which was still an essential schoolbook in the 20th century.

In addition to mathematics, and also building on the pioneering achievements of the Archaic period, the natural sciences flourished. Much, inevitably, was theoretical, but in what we would term physics for instance, Greek scientists evolved the atomic theory. It was still essentially the age of the universalist, but so much had been achieved that the greatest of them, Aristotle, gathered together in his Writings (which read more like lecture notes, carefully preserved for posterity,

than published works) his systematical concepts of the whole range of scientific thought – and beyond. The philosophers – a term coined in the Classical period – also turned to the study of human behaviour, politics and the nature of political relationships, the concepts of law and order and justice, of religious and related matters, of poetry and the arts. The nature of the ideal state was investigated; in size and scope, not surprisingly, it resembled the Classical Greek city state, but the unsatisfactory nature of contemporary political forms meant that no existing city furnished an ideal model, although Aristotle studied the constitutions, presumably all different, of some 150 of them.

How much of practical value this study of political theory achieved is dubious, though Plato went to Syracuse to advise the autocratic ruler of that city, and Aristotle was chosen by Philip II to be tutor to his son Alexander the Great. The principal achievement of the philosophers based in Athens, including Aristotle, who was not a native Athenian, was the institution of their own philosophical schools (again, with Archaic-period antecedents). These were based on the exercise grounds, the gymnasia, of the Classical city, and they survived and even developed as centres of intellectual life through the succeeding Hellenistic and Roman periods. Although as centres of paganism they were suppressed by the Christian emperor Justinian, they provided a model for Alexandria, for the Arabic centres of the Middle Ages, and so again through post-medieval Renaissance Europe to the present day.

During the Classical period there was a great flourishing of literature. Earlier literature, since the time and works of Homer, comprised exclusively poetry. Now a significant prose literature began. The Writings of Herodotus in many ways typify the Classical achievement. First and foremost, he brought to Greece a great personal knowledge of the wider world within which the Greeks existed and operated. Born at Halicarnassus in Asia Minor, he was by birth a subject of the Persian king; his neighbours were the non-Greek Carians. He certainly visited Egypt and other parts of the Persian empire before arriving in Athens, at the period of its great rise to power and prosperity following the defeat of Xerxes' invasion. He knew the leading political families, who told him their family histories, which were so important a part of the city's development. He was inspired to record the history of the Persian Wars, as the first united achievement of the Greek peoples since the siege of Troy (which to him, of course, was equally historical). In a world where education included above all else a knowledge of the Homeric poems, he set out to produce his own epic of the Persian Wars – but written in prose, not verse. He included everything that seemed to him to have even the least bearing on the history of the war, and thus preserved

for us a vast spectrum of contemporary knowledge. Above all, in doing this, he instigated the study of contemporary or near-contemporary events: as the “father of history” he certainly inspired his more methodical successor Thucydides, who wrote about the lesser war between Athens and Sparta, with a deeper insight into historical analysis that this tragic event required, and thereafter an endless sequence of historians, down to the present day. From this, too, prose became the natural medium of expression for the philosophers.

At the same time, drama was developed as a new form of poetic literature. Here, too, the roots lie in the Archaic period, in the choral odes sung and danced at religious festivals throughout the Greek world. Tragedy required the participation of individual actors, separated from the choruses. They played the roles of recognizable characters drawn from the almost limitless repertoire of traditional legend and myth. Significantly, actions based on contemporary events are almost unheard of; the main known – and surviving – example is Aeschylus’ play the *Persians*, which again was based on the events of Xerxes’ invasion. Comedy was more involved with contemporary affairs, particularly politics, and often portrayed real politicians or other public figures. It was all part of the ferment of contemporary intellectual life. The surviving examples of both tragedy and comedy come, almost inevitably, from 5th-century Athens. Drama went into a marked decline in the succeeding century, the only real survivor being the “new” non-political comedy of manners of the late 4th century BC. Until recent discoveries of these plays on papyri from Egypt, they survived only in Latin versions of the 3rd and 2nd centuries BC. From the Greek examples, later Latin plays, written as literary exercises rather than for production on the stage, in their turn inspired subjects for plays by Shakespeare.

It would be wrong to create the impression that Classical Greece was unified in its achievement. Some places – most obviously, Athens – predominate because their own position in the Classical world, their wealth, and their power were particularly inspiring. In these places the culture of the Classical period is very much a *Zeitgeist*, the spirit of the age. They might well stimulate achievement elsewhere. All the same, much of the Greek world was outside this achievement. Some cities, such as Sparta, quite deliberately turned their backs on it in a desperate attempt to preserve what were for them the more congenial virtues of the preceding Archaic period. Many places, poor and small and insignificant, remained outside through lack of opportunity or sheer ignorance. All the same, awareness of what was being achieved was widespread, and the excitement, if not the opportunity, was not restricted by political or geographical divisions. Aristotle, surely the greatest intellect of the Classical period, came from Stagira in

northern Greece, a place that recent excavation has shown to be nothing more than a rather squalid village; to gain intellectual fulfilment he had to move away, not just to the wealth of Philip II's growing kingdom but to Athens, in political decline but still the epitome of Classical civilization

Cleisthenes *fl.* 525–505 _{BC}

Athenian political leader

The clan of the Alcmaeonidae, to which Cleisthenes belonged, had been prominent in the old “Eupatrid” pre-Solonian aristocracy of Athens. One of its members, Megacles, was chief archon around c.630

BC when another noble, Cylon, attempted to seize power and set himself up as “tyrant”. Megacles rallied the people and blockaded him on the Acropolis. Cylon escaped, but his followers, who had taken refuge at the statue of Athena, were killed, despite a promise of safe conduct. As a result the whole clan was tried, put under a curse, and exiled.

Restored, it seems, at the time of Solon’s reforms (594 BC), the Alcmaeonidae emerged in the mid-6th century as leaders of the coast faction, the “Men of the Shore” in Herodotus’ account (1. 59) of the political struggles that led to Pisistratus’ three attempts to establish a “tyranny”; Aristotle (*Athenian Constitution*, 13) identifies this faction as the supporters of “the middle form of constitution”, such as Solon had tried to bring about, and views Pisistratus as “a man who seemed inclined to democracy”. The Alcmaeonidae went into exile (Herodotus, 1. 64) after Pisistratus’ successful third attempt with strong foreign backing.

Cleisthenes, who at this time was at least an adolescent, if not an adult, presumably went with them. But at some point, probably after Pisistratus’ death in 528/27 BC, he returned to Athens, now ruled by Pisistratus’ son Hippias, for he was almost certainly the Cleisthenes who appears in one fragment, discovered in the Athenian Agora, of a late 5th-century BC list of chief archons, as holding office in what its editors identify as 525/24 BC.

Later Cleisthenes was again in exile with many of his clan, who, after failing to spark a popular rising against Hippias by means of an armed incursion into Attica, withdrew to Delphi, where they obtained the contract for rebuilding the fire-damaged temple of Apollo. Their lavish performance of the task won them influence with the Delphic authorities, who were persuaded to advise the Spartans, whenever they came to consult the oracle, to liberate Athens from the tyrant. This advice was probably instrumental in winning support at Sparta for such men as king Cleomenes, who had other reasons for removing Hippias. In the event, after a failed seaborne invasion in 511 BC, the following year Cleomenes took a substantial army by land from the Peloponnese, won a battle, and forced Hippias into exile.

Cleisthenes’ role in these events is unknown, but he is identified by Herodotus (5. 66) as one of the two most powerful men in Athens after Hippias’ expulsion, his rival being Isagoras, described by Aristotle (*Athenian Constitution*, 20) as a friend of the tyrants. Isagoras gained the upper hand, being elected chief archon for 508/07 BC, whereupon, as Herodotus puts it, Cleisthenes “took the people into his party”, words echoed by Aristotle, who adds: “by proposing to give political power to the masses”. The clear inference to be drawn from their wording is that they believed that this action was born of

political expediency, a belief that the previous history of the Alcmaeonidae, for all their support of the Solonian reforms, cannot be said to refute.

Cleisthenes' appeal to the people must have met with a response, for Isagoras at once sought help from Cleomenes, who had worked with him in 510 BC. The Spartan king's reply was to call on the Athenians to expel Cleisthenes and others of "the accursed" (Herodotus, 5. 70) – the descendants of the Alcmaeonidae who had been punished with a curse after the massacre of Cylon's supporters in the late 7th century BC – and then to travel to Athens with a small force. Before he arrived, Cleisthenes himself left Athens, a move that, whatever his motive, enabled the people to decide on their best policy without the pressure of the curse, but Cleomenes still set about expelling as many as 700 households of Cleisthenes' supporters. He also tried to replace the Solonian Council of 400 with a body of 300 partisans of Isagoras, and then seized the Acropolis. The people rose against him and after a two-day siege forced him to depart under truce, expelled Isagoras, and recalled Cleisthenes.

Cleisthenes now carried out his promise to give power to the people. His principal reform was to create a new tribal structure for the political and military organization of the Athenian people, replacing the four old Ionian tribes based on kinship with ten new tribes based on 139 small local units, the demes, grouped in such a way as to minimize the influence of the wealthy landed nobles by making each tribe consist of people drawn from all over Athens and Attica. He linked demes together, not necessarily with their immediate neighbours, to form thirty *trittyes*, ten in each of three regions, the city, the inland, and the coasts, and then took one *trittys* from each region to form each new tribe. He thus aimed to preserve the unity of the state against the sort of powerful regional factions whose rivalries had led to Pisistratus' tyranny and whose re-emergence Isagoras' success seemed to foreshadow.

Cleisthenes then used the new tribes to reshape Solon's Council of 400. Enlarged to 500, it was to consist of 50 men from each tribe selected by lot from nominees of the demes, the members to change annually and no one to serve more than twice in his lifetime. These arrangements ensured that it could not be controlled by minority pressure groups, while educating a good proportion of the citizens in public affairs, and so it enabled the sovereign Assembly open to all citizens, whose business it prepared and whose decisions it carried out, also to be truly democratic and effective. The two essential institutions of Athenian democracy were now in place and functioning properly. Cleisthenes' enactment of the only other measure credited to him, the introduction of ostracism (Aristotle, *The Athenian Constitution*,

22), has been needlessly doubted on the grounds that the procedure was not used until 488/87 BC.

His name is not linked with any event after his reforms of 508/07 BC and it is not known what part, if any, he had in the successful defence of the new democratic Athens against threats from Sparta, Thebes, and Chalcis (506–505 BC), or even when he died. However, both Herodotus (6. 131) and Aristotle (*Athenian Constitution*, 29) refer to him without qualification as the one who “established democracy”; Isocrates in his *Areopagiticus* (c.354 BC) sees the system he set up as greatly preferable to the radical democracy of his own day. Under it, certainly, the Athenians were very successful. In the modern democratic era, although due weight has been given to the influence of Solon as the “father of democracy”, and although some scholars have detected signs of pro-Alcmaeonid gerrymandering in allocating *trittyes* to tribes, the essential role of Cleisthenes in the democracy’s development to maturity has been freely recognized, not least in the celebrations that marked the 2,500th anniversary of his laws.

Biography

A member of the Alcmaeonid clan, Cleisthenes (date of birth unknown) was probably chief archon in 525/24 BC during the tyranny of Hippias. After the expulsion of Hippias by Cleomenes of Sparta in 510 BC, Cleisthenes emerged as a popular leader and in 508/07 BC carried out political reforms that set in motion the machinery that would bring about the establishment of Athenian democracy. Date of death unknown.

Clement of Alexandria, St c.^{AD} 150–c.^{AD} 215

Christian writer

It is to a large degree thanks to Clement that the cultural and

philosophical traditions of Hellenism were deemed to be a legitimate component of Christian theology. In the religious and philosophical melting pot that was late-antique Alexandria, Clement fought a two-sided battle that was in many respects successful. Against the tendency to reject the Hellenic tradition outright evinced in Tatian, Tertullian, and Irenaeus, Clement defended the utility of Hellenic learning for the defence and deepening of the faith. On the other front, Clement attacked the complex and seductive speculations of the Gnostics, which had proved so attractive to many educated Christians.

The bulk of Clement's work forms a kind of trilogy. The *Protrepticus* or *Exhortation to the Greeks* is an attack on the absurdities of pagan religion and a call to accept the only true religion, that which has been sublimely revealed by Christ, the *Logos* of God. The *Paedagogue* or *Teacher* takes up the instruction of those who have accepted baptism. Its aim is to teach the perfect accomplishment of the virtues. The *Stromateis* or *Miscellanies* are, as the title suggests, a collection of diffuse materials; they deal, among other things, with the relation between the Christian faith and Hellenic philosophy, with marriage, and with the ideal of the true gnostic. In addition Clement composed a small work, *Quis Dives Salvitur? or Who is The Rich Man that is Saved?* This piece is a commentary on Mark 10: 17–31. Clement argues that the Christian is not required actually to sell all his goods, but rather to be free from attachment to them. Other works survive only as fragments.

Clement's teaching is centred on the *Logos*, the creator, instructor, and perfecter of humankind. The *Logos* has revealed God to the Jews in the Law of the Old Testament, to the Greeks in their philosophy, and finally and most perfectly in his own Incarnation. Philosophy is therefore a legitimate tool of Christian theology. The difference is one of degree, not of kind.

In opposition to the Gnostic tendency to divide Christians into more or less predetermined classes, Clement insists upon the sufficiency of faith and the equal grace conferred upon all at baptism. Also against the Gnostics, Clement affirms the integrity of the material order and the goodness of the body. Against the tendency found among Christians and Gnostics alike to denigrate marriage, Clement upheld its sanctity. He goes so far as to suggest that the married Christian is on a level above the celibate. The celibate has fewer distractions and encumbrances; his task is therefore easier.

Notwithstanding the equality of grace received at baptism, the Christian must strive for perfection. Through the exercise of his free will, he must struggle for the gift of *apatheia*, or freedom from passions. God is radically unknowable, but is made known to those who love him. Clement's apophaticism is more than mere agnosticism.

The true gnostic is led by the *Logos* to the contemplation of God. By way of this anagogy, man is deified. Clement speaks of man's deification with almost unprecedented clarity.

Of Clement's immediate background we know frustratingly little. He is very vague about his own teachers, naming only one of them, the Alexandrian lecturer Pantaeus. His work is suffused with Platonic philosophy and Stoic ethics, and marked by Aristotelian logic and vocabulary. His frequent allusions to Classical literature, no doubt intended to keep up the interest of his cultured audience, are drawn from both florilegia and direct acquaintance. He is patently indebted to the Jewish Platonist Philo of Alexandria, particularly in respect of the allegorical method of biblical exegesis, the incomprehensibility of God, and the ideal of *apatheia*. Clement's integration of the Hellenic tradition and Christianity is a more searching and critical development of that proposed by St Justin Martyr. Clement's *Exhortation* owes some elements to Tatian's *Exhortation*.

The influence of Clement has been profound. The fusion of Hellenic philosophy and moral teaching with Christianity proved to be a heady mixture. Origen, though a man of greatly different temper, continued the work of Clement, establishing Christian Platonism as the hallmark of the school of Alexandria. The Cappadocian Fathers represent the greatest flowering of the tradition of Clement and Origen. Clement's influence is clearly perceptible in the works of Evagrius of Pontus and pseudo-Macarius, the two great fountainheads of monastic spirituality. Clement's conception of the angelic hierarchies may be regarded as an ancestor of that made famous by Dionysius the Areopagite. Clement is quoted with deep approval by St Maximos the Confessor. He continued to be an important authority for the Byzantines. While removed from the Roman martyrology in the late 16th century, he remains accounted a saint by the Orthodox Church.

MARCUS PLESTED

Biography

Born c.AD 150, probably at Athens, educated at Alexandria in the catechetical school of Pantaeus, whom he succeeded. Principal surviving works are: *Protrepticus* (*Exhortation to the Greeks*), *Paedagogue* (*Teacher*), and *Stromateis* (*Miscellanies*). He argued for the legitimate retention of Hellenic cultural and philosophical traditions in Christian theology. He left Alexandria in 202 before the persecutions of Septimius Severus and died between 211 and 216.

Cleomenes III 260–219_{BC}

King of Sparta

The lives of Cleomenes III (Agiad, reigned c.235–222_{BC}) and his predecessor Agis IV (Eurypontid, reigned c.235–222_{BC}) are the subject of numerous studies and novels, ancient as well as modern. After Lycurgus the lawgiver, Leonidas, and Agesilaus II, they are the most famous exemplars of Spartan culture. Their achievements and significance, on the other hand, are the stuff of history.

Cleomenes probably acceded to the Spartan throne in 235_{BC}. He could not have chosen a more pregnant moment. For it was then that Aratus achieved the decisive gain for the Achaean League that imperiled Sparta's future, in a way that Macedonian suzerainty of Greece had not. Megalopolis, led by its ex-tyrant Lydiadas, threw in its lot with Achaea, whose foreign policy thereby took on a decidedly anti-Spartan flavour. Like all his royal predecessors since Agesilaus II, only more so, Cleomenes had to keep watch on Megalopolis, no matter how preoccupied he might be otherwise with internal upheaval or other external threats from inside or outside the Peloponnese. Unlike all his predecessors, Cleomenes not only recovered from Megalopolis the disputed borderland of Belminatis but actually destroyed the urban centre of the Great City itself. For this, among many other things, he earned the enduring hatred of Polybius, even though the historian was born in a resurgent Megalopolis, 20 years after the king's ignominious death in exile.

The only hope for Sparta to regain its important standing in the Peloponnese was to mobilize all its inner strength and deal with the urgent social problems that beset it. Cleomenes seems to have understood this at a very early stage, and, instead of following the example of his father Leonidas and his father's cousin Areus, he decided to emulate Agis. It came as a surprise to his contemporaries to see the principles of Agis adopted by the son of his most bitter enemy.

Cleomenes was neither a romantic dreamer nor a dogmatic rationalist, but a practical politician. He was determined to solve the urgent social problems of Sparta in order to increase its political and military power, and at the same time to strengthen his own position. He knew very well that he could not carry out the necessary reforms by persuasion alone, and therefore tried to gain popularity and fame through military feats.

This does not mean, of course, that these events cannot or should not be viewed within their wider context, particularly the continuing balance of power between the three great dynasts of Macedon, Egypt,

and the Near East. Indeed, it was this stalemate and, particularly, the enfeebled Macedonian suzerainty over Greece as represented successively by Antigonos II Gonatas (c.277–239 BC) and Demetrius II (c.239–229 BC) that allowed the Aetolian League, the Achaean League, and then Sparta under Cleomenes the space for internal consolidation or transformation and external expansion. In fact, it was the resurgence of Macedon under Antigonos III Doson in the 220s BC, ironically precipitated by Cleomenes, that fully exposed the limitations of the single Greek city state as a power unit and put paid to Sparta's illusory independence and ephemeral social renewal.

Cleomenes had planned his coup well in advance with the collaboration of a small group of sympathizers, including his stepfather Megistonus, a rich landowner. Returning to Sparta one evening (probably in the autumn of 227 BC) he fell upon the ephors at supper, killing four of them and ten of their chief supporters, and seized power. Eighty opponents were proscribed. Cleomenes then proceeded to carry out the same revolutionary programme that had led to the downfall of Agis. All landed property was put into a common pool, debts were cancelled, and the land was divided into 4,000 Spartan lots. He raised the citizen body to perhaps 5,000 from the metics and *perioikoi* (dwellers round about), but in the reassignment of the land, lots were reserved for proscribed exiles, whose eventual reconciliation and return was evidently envisaged – or at least that was the impression that Cleomenes sought to convey. Equally important for his aims, the traditional Spartan *agoge* (upbringing), with military training, age groups for boys, and common messes for adults, was reintroduced. But Cleomenes' measures were not simply backward-looking. Now at last, a century after Alexander and after several Spartan defeats, he introduced the Macedonian type of phalanx and spent the winter drilling his troops in the use of the long pike, the *sarissa*. Constitutionally, he weakened the Gerousia by attenuating or removing some of its powers, and by making election to it annual rather than for life (a major source of its enormous prestige), and abolished the ephorate, which he condemned as an excrescence on the "Lycurgan constitution", a move that led his opponents to brand him as a tyrant. According to Pausanias, he established a new board of magistrates, the *patronomoi* (the title means "Guardians of Ancestral Law and Order").

The Cleomenean revolution struck a chord in the cities of Sparta's Achaean opponents, where the poor sub-hoplite citizenry yearned for debt cancellation and land redistribution on the Spartan model, which they obviously regarded as exportable. This, however, was a grave misapprehension, because Sparta's unique sociopolitical conditions could not simply be reproduced elsewhere, and because Cleomenes

had no intention of exporting social or economic revolution of any kind. Ideological preference may have had something to do with this refusal, but a more powerful factor was the pragmatic consideration that Spartan hegemony over an association of cities dominated by mass movements of a genuinely democratic character was likely to be radically unstable and bound to attract the unwelcome attention of Macedon, which had made its views on popular social movements unequivocally clear from the very outset of its hegemony of Greece.

The Cleomenic War, the war against Cleomenes as seen from the Achaean standpoint, lasted from 229/28 to 222 BC. At the beginning Cleomenes was very successful, and almost provoked the collapse of the Achaean League. By the beginning of 224 BC his military-political drive had not only brought Argos and most of Arcadia within the Spartan camp but had carried his victorious arms into and beyond the original Achaean heartland to the very gates of the Peloponnese at Corinth. The victory in the field at Hecatombeum in western Achaea in 226 BC was matched in 225 BC by the diplomatic triumph of the adhesion of Argos. Even Aratus' own Sicyon trembled before the blast and had its loyalties severely strained. A few months into 224 BC, however, the wily and perplexing Aratus, former liberator of the Acrocorinth and unifier of much of the Peloponnese on an ostensibly anti-Macedonian alliance, deployed his recently acquired authority as general plenipotentiary (*strategos autokrator*) to lead the Achaean League into an alliance with none other than the old enemy Macedon.

A century before, the decisive battle between a still independent Greece and Macedon at Chaeronea had preceded the formation in 338 BC of Philip's Hellenic League, usually known as the League of Corinth. In the 220s BC the decisive encounter between Macedon and a still independent Sparta succeeded the formation of a new Hellenic League conceived on significantly different lines. Not only was Doson's league directed specifically against Sparta and the generated social revolution it was supposed to stand for, but this was an alliance of federations, not single poleis.

The battle that was to settle the war was fought near Sellasia on the northern borders of Laconia. But Cleomenes' cause was already lost, and Ptolemy IV Philopator acknowledged that he had become a poor investment by cutting off his subsidy just days in advance of the fighting. But so far as can be ascertained, the decisive factor in Macedon's victory was superiority in numbers. Cleomenes' losses were heavy; but he himself escaped with a handful of men to Sparta, and thence to Gytheum, where they embarked for Egypt, to join his mother as a refugee in Ptolemy's Alexandria. Antigonos proceeded to take Sparta and achieved what Philip II had scorned to attempt and Pyrrhus among others had failed to execute, the first capture of the

city.

Cleomenes' political reforms were now cancelled and the ephorate was restored; the kingship was in effect left vacant. The fate of his social and economic measures is less certain. The cancellation of debts clearly could not be reversed. It seems on the whole likely that in this field Cleomenes' measures were not wholly abrogated but that some sort of compromise was reached.

A vaguely Cleomenean political tendency at Sparta survived the battle of Sellasia. But it was a lost affair, especially after the pathetic deaths of Cleomenes and his handful of supporters at Alexandria in spring 219 BC in a futile rising against the new Ptolemy IV Philopator. The legend of Cleomenes, however, was in safe hands, and his ideas influenced generations to come.

DIMITRIS A. KALOGERAS

Biography

Born 260 BC. Spartan king (235–222 BC) and political reformer. Cleomenes tried to solve the social problems of Sparta in order to increase its political and military power and at the same time strengthen his own position. He reinstalled the Lycurgan political system, cancelled debts, and redistributed land in equal portions. His reforms alarmed neighbouring states, especially Macedon. He was defeated in 222 BC at Sellasia and his reforms cancelled. He went into exile and died in Alexandria in 219 BC.

Cleopatra 69–30 BC

Queen of Egypt

Cleopatra was born in 69 BC to Ptolemy XII Auletes, king of Ptolemaic Egypt, and (almost certainly) his sister-wife Cleopatra V. The third of

their six children, Cleopatra grew up against the backdrop of her father's turbulent reign, in the course of which he was deposed and fled Egypt for some years. During this period Cleopatra's two elder sisters ruled as pharaohs, although one soon died and the other was killed after Ptolemy XII was restored with Roman support. Nothing is known about Cleopatra's early life, but when her father died in 51 BC, Cleopatra was his eldest surviving child and acceded to the throne as Cleopatra VII Philopator, ruling jointly with her younger brother Ptolemy XIII, whom she married in accordance with Ptolemaic custom.

On account of the machinations of ambitious ministers and the agitation of the Alexandrian populace, the Egyptian throne was still far from secure. A war was engineered between brother and sister, leading to Cleopatra's expulsion from Alexandria. During the course of the contemporaneous Roman civil war between the triumvirs Pompey and Julius Caesar, Pompey fled to Egypt after his defeat at the battle of Pharsalus, and was pursued by Caesar. Pompey was treacherously murdered by the supporters of Ptolemy XIII. When Caesar arrived with his troops he decided to support the claims of Cleopatra and fought on her behalf the Alexandrian War against her brother. Caesar was by now married to his third Roman wife and was in his early 50s; Cleopatra was a young woman of about 20. Tradition maintains that she came to meet him in secret wrapped in a linen sack, and that Caesar, susceptible to feminine wiles, was immediately captivated by her.

Roman forces won the war, in the course of which Ptolemy XIII was killed. Caesar restored Cleopatra to the Egyptian throne and had her married to her other younger brother Ptolemy XIV, ostensibly to rule jointly with him. It is after this that Caesar and Cleopatra took their legendary Nile cruise to explore the country of Upper Egypt, an episode which has been much romanticized in recent times. No details about this trip survive, but when Caesar left Egypt sometime in 47 BC, Cleopatra was pregnant, allegedly by him. Later that year she gave birth to a son, known as Caesarion ("Little Caesar"). In 46 BC, for reasons which remain obscure, Cleopatra and her son followed Caesar to Rome, where they remained until his assassination on the Ides of March in 44 BC.

After the murder of Cleopatra's great champion and protector, the queen returned to Alexandria. She engineered the murder of her brother Ptolemy XIV and installed her young son on the throne with her as Ptolemy XV. The political consequences of Caesar's murder were great. One of his major supporters was Mark Antony, who allied himself with Octavian, Caesar's great-nephew and posthumously adopted son, against Caesar's assassins. After their defeat of the

assassins, Antony and Octavian divided the territory of Rome between them, but gradually fell out with each other to the extent that civil war again ensued. Antony, whose power base was in the east, summoned Cleopatra to meet him in Cilicia in 41 BC. Ancient sources describe Cleopatra arriving in her spectacular state barge at Tarsus adorned as Aphrodite, having cunningly calculated the effect of her appearance and such a dramatic arrival. Although Antony was by now a mature man in his 40s married to his third Roman wife, he was instantly smitten by the queen. She invited him to a sumptuous feast aboard her barge, and was lavishly entertained by him the following day.

Antony and Cleopatra spent the following winter together at Alexandria, enjoying a life of luxury, the extravagant Ptolemaic court life clearly appealing to the self-indulgent Roman. Cleopatra bore him twins (a boy and a girl) in 40 BC. Antony left Egypt to deal with events in Rome, taking as his fourth wife Octavian's half-sister Octavia in an attempt to improve relations with his rival. There is no evidence that he saw Cleopatra again until 37 BC, when he met her in Syria. It appears that their relationship was further consolidated, though it stopped short of marriage since Antony was still legally married to Octavia. He acknowledged his paternity of their twins, and Cleopatra bore him another son the following year.

Relations between Antony and Octavian worsened, no doubt hastened by this insult to Octavia. Antony campaigned in Parthia and Armenia, with varying results, but the final break with Octavian came after a ceremony in Alexandria in 34 BC, known as the Donations of Alexandria. At a grand spectacle Cleopatra was confirmed as queen of Egypt and the surrounding lands in conjunction with her son Caesarion, and the rest of the eastern territories were divided between the two sons of Antony and Cleopatra. By this act Antony and Cleopatra claimed dynastic succession for their children even as he granted Roman territories to the half-Egyptian princes. War with Octavian was now inevitable, and large forces were mustered.

The combined forces of Antony and Cleopatra were defeated by Octavian in the naval Battle of Actium (off the west coast of Greece) in 31 BC. The tactics of the battle have occasioned great debate, but Cleopatra's ships, lined up behind those of Antony, fled the scene through a gap in the battle lines and headed for Egypt. In despair, Antony followed her, his ships were captured, and his land forces gradually defected to Octavian. The campaign was lost. It only remained for Octavian to capture his two foes.

Antony and Cleopatra slowly returned to Egypt, and resumed their relationship. They spent the winter of 31 BC in Alexandria in a life of profligate luxury, reminiscent of the early days of their courtship.

They made plans for further warfare even as Octavian approached Egypt. Various embassies were sent to Octavian. Some sources attest that Octavian secretly told Cleopatra that he would spare her if she betrayed Antony; others that Octavian pretended to be in love with Cleopatra so that she would not kill herself and burn the colossal treasure which she had collected in her unfinished tomb. In any event, it appears that Cleopatra was terrified of capture and being forced to march as a captive in Octavian's Roman triumph, which the victor clearly intended.

Egypt was attacked in 30 BC, and Antony was ultimately unable to stave off defeat when many of his land and naval forces deserted to Octavian. At the news of the final defeat, Cleopatra locked herself and her servants into her tomb and apparently sent out a message to Antony that she was dead. Antony killed himself with his sword, and some days later, despite Octavian's efforts to keep her alive, Cleopatra was found dead in her tomb, allegedly killed by the bite of an asp although rumours of poison were known.

Cleopatra's death ended the rule of the Greek Ptolemaic dynasty of kings in Egypt, and the country became a province of Rome. It was her fate, for good or ill, to come into contact with two of the most powerful Romans of their day, and her love affairs with them have ensured her undying fame. In hostile Roman sources Cleopatra was depicted as an eastern witch who had seduced two noble Romans, yet she was a Greek and only the first of her dynasty to speak Egyptian. Her political cunning and capacity for survival, whether as victim or manipulator, meant that Egypt remained Greek and independent from Roman rule for longer than the other Hellenistic empires.

Climate

Greece has a Mediterranean-type climate similar to that of Spain or California, with harsh dry summers (the dead season) and warm wet winters (the growing season in the lowlands).

The year begins in September, when clouds start to gather and the sun no longer burns so relentlessly. The first rains, coming one to ten weeks later, awaken plant growth for the winter. Frost and snow are rare but significant: olives cannot be grown in hollows where cold air gathers. Soil moisture typically reaches a maximum in spring; then the rains tail off, the heat of the sun rises, and evaporation increases. Many plants settle down to their summer dormancy, but some – notably the vine – are less well adapted to the climate and remain active through the dry season, their deep roots extracting water from the bedrock.

Greece is the land of lazy days in the crushing sun of a summer beach, and active days in the genial warmth of a southern winter; but also of people dropping dead from heat in the streets of Athens, or drowning in a flash flood in an arid Cretan gorge; of distant mountains glittering with snow; of the clammy mists from which the volcano island Santorini draws its moisture; of fire-storms jumping gorges, blasted by the October sirocco; of mules struggling through the snow

in the high passes of Crete in July. Deluges are rare but very significant: once in a lifetime half a year's rain falls within a day or two and transforms a landscape.

Greece in general has a wet west side and a dry east side. The areas frequented by tourists are mostly dry, especially the islands. Athens, in the east, is one of the driest cities in Europe; Olympia, Patras, and Corfu, in the west, are relatively wet. High mountains distort the pattern; each one has a rain-excess on its northwest side, where the rain-bearing winds strike it, and a rain-shadow on the southeast. The southeast corner of Crete has less than 300 mm of annual rainfall; the high mountains probably get over 2000 mm, most of it as snow. One can have the illusion of going from Wales to Morocco in an afternoon's walk.

At high altitudes plant growth is limited by winter cold as well as summer drought. In the Pindus the growing season may be as short as two months: cereals and vines can be grown there but not olives. Modern Greeks cannot bear the cold, and flee from it if they possibly can. The highest all-year settlement is at 900 m, less than half as high as in the Alps, and a little higher than in Norway; anything higher calls for transhumance. Settlement has been much higher in prehistory.

Dust is a significant factor. It is picked up by storms in the Algerian Sahara and is transported in the upper atmosphere, to fall as a "red rain" of mud, especially in Crete. Over the centuries this has been an appreciable addition to the soils of the island, and may contribute to Crete's unexpected fertility.

Has the climate always been so? Records of unusual weather are fairly copious from islands in later phases of the Little Ice Age (1590s and 1690s AD). These were decades of extreme weather – cold, heat, drought, deluges – greater than anything that seems to occur now. Crete then had many more permanent rivers than today.

Climatology was already a discipline in ancient Greece. Theophrastus' best surviving work was in this field. Unfortunately the interest of ancient philosophers in theories rather than data means that they have little to tell us. The climate of ancient Greece was not grossly different from what it is now, but without instrumental measurements it is impossible to verify whether the climate – as opposed to unusual weather – was quite the same. If the ancient Greeks really went naked as on vase-paintings, they should have shivered in the chill damp of spring and been tortured by sunburn. (Modern Greeks are fully clad, and enjoy shade and the summer night.) It is an open question whether the clear atmosphere attributed by modern writers to ancient Greece, unlike the hazy, often-murky atmosphere usual today, is merely a proverbial platitude, or whether

there has really been a change.

It is often conjectured that some change or other in early human affairs, for example the decline of the Mycenaeans, was due to a change of climate, such as drought. These claims lack independent evidence. There is, however, some evidence that winter snow was then it is now, and vegetation zones possibly lowers. Theophrastus makes the definite (though secondhand) statement that settlement and cultivation reached higher into the mountains of Crete in the past than in his time.

The present Mediterranean climate, however, is not very much older than Greek history. During the ice ages, up to 14,000 years ago, Greece was drier and colder than it is now. There was then a period of wetter, less strongly seasonal climate than today, when northern trees such as lime and alder were common down to the south of Greece and even in Crete. The change to something like the present climate began in the 5th millennium BC and was completed in the Bronze Age. Agriculture, coming after the change, is reasonably well adapted to a summer-dry climate (except in the case of the vine), whereas wild vegetation has not had time to adapt and copes as best it may. Not many Greek trees lose their leaves in summer as one might expect.

Coinage

Ancient Greek coinage developed in Asia Minor, probably influenced by the circulation of Lydian coinage in the 7th century BC. The production of Greek coinage grew as the polis flourished and spread throughout the Mediterranean during the height of the colonization phase between c.700 and c.500 BC. As a result, coinage in antiquity was an essentially Greek phenomenon and became a medium of exchange, the legacy of which remains with us today.

Money had existed long before the introduction of coinage. But it is less clear in the Greek world, at least, what exactly constituted money. We know that bars of precious metal were used as currency in the 8th century BC. Smaller payments, which required smaller denominations of coinage than were offered by early silver coinage, were probably served by other forms of money. Arrowheads, for instance, were used

from the mid-6th century BC in the Black Sea area.

The earliest known Greek coins belong to the 6th century BC, but our knowledge of them is limited by the availability of good, datable archaeological contexts. The earliest archaeological evidence for the existence of coins dates from the middle of that century at the temple of Artemis in Ephesus. The coins of the Lydian king Alyattes, of a gold and silver alloy called electrum, were marked and punched with designs. Most Greek coinage was to be made of silver. Electrum was retained by a few cities (e.g. Cyzicus, Mytilene, and Phocaea) and then only until the 4th century BC.

It is clear that by c.500 BC silver coinage had been adopted by Greek cities throughout the Mediterranean – in Greece, Italy, Sicily, and the Hellenized parts of the Achaemenid empire, primarily western Asia Minor. It was not until the conquests of Alexander the Great in the third quarter of the 4th century BC that we see the further expansion of Greek coinage into Babylonia, Bactria, and eventually India (Cribb 1983). Rome also began to imitate Greek coinage at the end of the 4th century BC (Howgego 1995, p.10).

The introduction of coinage has yet to be explained conclusively. Some have suggested that coinage was required to pay mercenary soldiers employed in campaigns, others that coins were used to facilitate large payments by and to states (Cook 1958; Kraay and Jenkins 1976, pp.317–28). Such speculation was limited until recently by the absence of small-denomination coins, but new examination has revealed in some quantity evidence for fractional coinage at least for the late 6th and 5th centuries BC. Small denominations have appeared so far only for silver coins: these small issues discovered would still retain some value, for example the smallest electrum coin represented a day's wages (Kraay, 1964). It is only with the introduction of base metal coinage, such as bronze, apparent in Greece from around the mid-5th century BC, that one can start to think of a more diverse role for coinage.

The development and spread of Greek coinage are inextricably linked with the development of the polis and the increase in the political and economic forces of Greek-speaking communities in and around the Mediterranean. The payments made by these city states were clearly facilitated by the development of coinage. Civic coinage was validated by markings that confirmed the value and legitimacy of the state's coinage; the Greek word for coin – *nomisma* – was linked to the legitimizing authority through the laws – *nomoi* – that regulated production. However not all Greek coinage was produced by states; often individuals issued coins, acting as or representing "states". The number of individuals issuing coins exploded at the end of the 4th century BC. Ptolemy I established a precedent for the other Hellenistic

kings by having his portrait put on the obverse of Egyptian coinage around 305–304 BC.

Designs on Greek coinage were synonymous with the issuing city or authority. Towards the end of the 6th century BC Athens produced coins with an owl depicted on the reverse. The bird was associated with their tutelary divinity Athena – she appeared on the obverse – and the coins soon became known as “owls”. Other states had their civic designs struck on the obverse: Aegina had a tortoise, Corinth a colt, later in the 4th century BC the monarchic leaders were to introduce their own image on to the obverse face of their coinage. Coinage from the end of the 4th century BC becomes much more closely associated with individuals, typically the Hellenistic dynasts. In the later Hellenistic period the names of eponymous officials stamped on coins allows greater precision in dating.

Coinage was one way for a city or a ruler to extend his identity through the coin types. The circulation of coinage provided a useful means of conveying ideas and meaning. Coins were therefore an important means of spreading propaganda and political messages. Around 405 BC the cities of Rhodes, Cnidus, Iasos, Samos, Ephesus, Cyzicus, and Byzantium issued coins with the same obverse type of Heracles strangling a serpent, while retaining their own civic design on the reverse. By sharing the same coin type, these cities were able to display their support for Sparta. Under the leadership of Lysimachus, of Heraclid descent, they had defeated Athens, represented by a snake symbolizing Cecrops, the founder of Athens (Howgego 1995, p.63; Karwiese 1980).

Greek coinage circulated over a wide geographic area. The most popular coins in the Classical period were the Athenian silver “owls”. Most coins were made from precious metals and their value equated loosely to the content of metal in the coin. Not all Greek cities observed the same weight standards, however; thus an Athenian, Corinthian, and Aeginetan drachma were all of different weights. The Athenian silver coinage was made from metal of a higher silver content than any other contemporary Greek coin. This, and the political might of Athens that the city enjoyed thanks to its 5th-century BC empire, ensured that its coinage was established as one of the most important issues in the Mediterranean. The Athenian weight standard eventually became the norm for many of the Hellenistic kingdoms from the end of the 4th century BC. The use of the Athenian system for Alexander issues preserved this weight standard in some areas until the 1st century BC. Post-humous Alexander issues remained popular for much of the Hellenistic period.

Reducing the weight standard was one form of monetary manipulation. Debasement of coinage is known; Athens introduced a

“copper” currency around 406 BC (Howgego 1995, p.111). A more familiar ploy was to reduce the precious-metal content in the coin. Ptolemy I introduced major reforms to Egyptian coinage between c.310 and c.290 BC, abandoning the Athenian weight standard and eventually lowering the weight of his silver tetradrachm by nearly 20 per cent. Egypt operated a closed economy, and all coinage had to be exchanged for local issues, a development paralleled within the Attalid kingdom at the start of the 2nd century BC.

Many Greek coin producers lacked local silver resources. Rich local deposits of precious metals were available in some areas. The Athenians in the Laurium hills of southwest Attica, those on the island of Siphnos until the flooding of the mines in the 5th century BC, and the people of Thrace, Macedon, and Thasos all had access to supplies of precious metals. At Pangaeum, in Thrace, east of Amphipolis, Philip II of Macedon increased the extraction of the silver and gold from the mines after 356 BC. His son Alexander the Great used the metal to produce coins that were to circulate over vast distances and dominate the Hellenistic world. But good local metal supplies were not always necessary for the widespread circulation of coin: the distribution of Corinthian and Aeginetan issues in the Archaic and Classical era indicates that commercial activity was the main reason for the spread of their coinage.

Coin production took place in mints. Skilled craftsmen produced the designs for the coins on metal dies, which were used to punch the desired image on to the two sides of the coin or flan. It was normal for one of the two dies to be gripped in an anvil. The impression made on the coin by this static die is known as the obverse; the other side of the coin is known as the reverse and the image here was created by striking the die on the upper side of the flan. The dies used to strike coins would eventually deteriorate and sometimes break; the lower the would almost always have the longer life expectancy. A number of “new” coins were produced by striking new images on to existing coins. Such coins are known as “overstrikes”.

Mints could also copy the designs of other coins. A number of cities in Sicily and south Italy were particularly famed for the quality of their coins and the types used were imitated throughout the Mediterranean. The head of Arethusa, which appeared originally on a Syracusan issue created by the famous engraver Cimon, was clearly imitated in the shape of the nymph who appeared independently on 4th-century BC coins at Larissa in Thessaly and at Tarsus in Cilicia. A number of coin producers imitated the designs and types of other cities: the Athenian silver tetradrachm was copied in Babylon, Phoenicia, and Egypt during the Classical period.

Coin distribution evolved with changing political and economic

circumstances. So the rise of the Hellenistic kingdoms from the late 4th century BC marked a significant shift. Two levels of coin circulation can be observed. Coins issued by the monarchs enjoyed a far wider international acceptability than those of many of the smaller Greek cities. The exception in the Hellenistic period was probably Athens which revitalized its coinage in the 2nd century BC with the production of the so-called New Style Athenian coinage. Like Rhodes, Athens continued to issue a silver coin down to the 1st century BC.

From the 4th century BC more local bronze coins were issued in Greece, and these enjoyed considerable regional success, rarely being found outside their immediate centres of production. The bronze issues played a major role in the local economy and coins were minted for specific religious festivals, such as the Eleusinia in Attica. Bronze issues increased and were widely employed by Greek cities as Rome dominated Greek politics from the early 2nd century BC.

The federal Greek states became important producers of coinage in the Hellenistic period; in Asia Minor Greek cities continued to mint coins following the treaty of Apamea. By the end of the 1st century BC many Greek cities were no longer issuing their own distinct coinage. By this time, and throughout the 1st-3rd centuries AD, local Greek coins had taken on the appearance of Roman coins and were restricted to being struck in bronze. Under the Roman empire more Greek-speaking cities in Asia Minor were issuing coins than at any other time in antiquity. In the 3rd century AD the local production and circulation of provincial bronze coins issued by Greek cities reflects considerable economic developments within the Roman empire.

Colonization

It should be remarked at the outset that the term "colonization" to describe Greek expansion throughout the Mediterranean and Pontic areas is a coinage of modern scholarship. It is employed by historians to indicate the process whereby, from the 8th century BC through to the Hellenistic era, Greek cities took collective and conscious decisions to plant sections of their population on foreign soil under the leadership of an *oikistes* (founder) who was responsible for the distribution of land plots to his fellow colonists and the transfer of metropolitan cults to the new civic foundation which was generally independent of its metropolis (though Corinth seems to have continued to exercise some authority over its colonies). There are, however, three difficulties with this conventional definition.

First, while in modern historiography the colonizing process is distinguished sharply in both chronological and definitional terms from the migratory traditions regarding earlier movements of peoples such as the Dorians, Ionians, or Aeolians, ancient authors made no such distinction. Thucydides (1. 12. 4), for example, uses the same terminology to describe both the Athenian colonization of Ionia (the "Ionian migration") and the 8th-century BC Peloponnesian colonization of Italy and Sicily.

Secondly, it is not at all certain that the early colonial ventures of the 8th century BC were as organized and public in nature as the prevailing orthodoxy upholds. A case in point is the late 8th-century colonization of south Italy which the sources attribute to cities in Peloponnesian Achaea despite the fact that there is neither literary nor archaeological evidence for Achaean cities much before the 5th century BC. The fact is that the "mechanics" of early colonization are often and all too uncritically retrojected from foundation decrees of later periods, particularly those concerning the foundation of Naupactus (first quarter of the 5th century BC:), Brea (third quarter of the 5th century BC), Black Corcyra (4th century BC), and Cyrene, where it is impossible to gauge the extent to which a 4th-century decree replicates – as it claims – an original foundation decree of the later 7th century BC (though the weight of scholarly opinion inclines towards scepticism). Similarly, literary accounts for colonial foundations rarely predate the 5th century BC: thus, the developed tradition concerning the founding of Cyrene (which is frequently – though not unproblematically – regarded as a "model" for colonial foundations in general) is not attested before Pindar and Herodotus (see further

below). A related point concerns the chronology of foundations. Thucydides (6.3–5) gives dates for the earliest colonies of Sicily while a more complete list is presented by Eusebius of Caesarea (late 3rd century AD). In neither case is the source of their information certain nor how they reckoned their dates. Archaeological investigation can certainly assist in answering this question, though the commencement of colonial activity – as opposed to less formal transactions of trade or exchange – is not always immediately apparent in the material record and in any case our ceramic chronologies are based in part (and more than is often admitted) on the Thucydidean and Eusebian dates. In general, the probability is that the origins of the earliest colonies were more haphazard, mixed, and gradual than is often stated.

Thirdly, while it would be unsound to regard Mycenaean material objects found in south Italy, Sicily, and the Aeolian islands as reflections of an early Mycenaean colonization of these areas (Mycenaean material is also found well inland in Anatolia), it does now appear that colonial activity may in some instances predate the 8th century. Thucydides (4. 123. 1) regards the city of Mende in Chalcidice as a colony (*apoikia*) of Eretria and it has often been assumed that Mende along with Torone (also in Chalcidice) were Euboean foundations of the Archaic period, but recent excavations at both sites have recovered Euboean and Euboeanizing material that dates back as far as the 10th or even 11th century BC. It is possible that this colonial activity represents a “rehearsal” for the more numerous and distant colonies planted in the west in the 8th century.

Indeed, the Euboeans of Eretria and Chalcis appear to have been prominent participants within the early colonization of the west. Both are said to have founded Pithecusae on the island of Ischia in the Gulf of Naples (Strabo, 5. 4. 9) with the Chalcidian element transferring to Cumae on the mainland opposite (Livy, 8. 22. 5–6): archaeological evidence suggests a date of about 775 BC for Pithecusae and 725–700 BC for Cumae. According to Thucydides (6. 3. 1) the first Sicilian colony, Naxos, was founded by Chalcidians under the leadership of Theocles in 734 BC, with Leontini and Catana following in 729 BC, while a Euboean presence is attested before the end of the 8th century at Zancle and Rhegium on either side of the Straits of Messina. Corinthians under the Bacchiad Archias are said to have founded Syracuse in 733 BC (Thucydides, 6. 3. 2)– a city which was to participate in the “secondary” colonization of Acrae and Casmenae in the mid-7th century and Camarina at the beginning of the 6th century BC. Megara Hyblaea was supposedly founded in 728 BC by Megarians who had failed to settle Leontini (Thucydides, 6. 4. 1) and established its own colony at Selinus a century later. Rhodes and Crete are said to have founded Gela in 688 BC (Thucydides, 6. 4. 3), followed in 580 BC

by Gela's foundation of Acragas (Strabo, 6. 2. 5). Finally, Achaeans are credited with the foundation of several colonies in south Italy – including Sybaris and Croton towards the end of the 8th century, Metapontum and Caulonia in the second half of the 7th century, and Posidonia in the early 6th century – while Tarentum was founded by Spartan dissidents in the last decade of the 8th century and Epizephyrean Locri by Locrians in the early decades of the 7th century BC.

The second major area of early colonial activity was in the region of the Hellespont, Propontis, and Black Sea. Milesian foundation is attributed to Abydus on the Hellespont (670 BC?), Cyzicus in the Propontis (756 BC?), and Sinope (631 BC?) together with a host of other colonies in the Black Sea; Miletus is also said to have participated with Paros and Erythrae in founding Parion in 709 BC. The Megarians planted the colonies of Astacus, Chalcedon, Selymbria, and Byzantium at the eastern end of the Propontis in the course of the 7th century and collaborated with the Boeotians in founding Heraclea Pontica c.560 BC. Towards the end of the 7th century, the Athenians founded Sigeum on the Hellespont and Samos established Perinthus on the northern shore of the Propontis, while the Teian colony of Phanagoria on the northern shores of the Black Sea probably dates to the mid-6th century BC.

In the far west, settlers and refugees from Phocaea are credited with the foundation c.600 BC of Massilia in southern France and Emporion in Spain. In the northern Aegean, the Chalcidice peninsula was settled by Eretrians, Chalcidians, Achaeans, Corinthians, and Andrians while Paros led a Panhellenic venture to colonize Thasos in the mid-7th century and Samians are said to have settled Samothrace in the second half of the 6th century BC. Finally, Libyan Cyrene is said to have been colonized by Thera c.630 BC and archaeological evidence suggests that other settlements were established in Libya at Tocra, Euhesperides, and Barca from the last third of the 7th century to the middle of the 6th century BC.

The motives for early colonization are the subject of scholarly controversy and it is probably unwise to insist upon unicausal factors. Some colonies may have been established for the purpose of exploiting trading opportunities, though most were situated on headlands and estuaries in possession of fertile plains, so it may be that the increased sedentary conditions of mainland Greece in the 8th century (together with consequent demographic increase) led to a shortage of agricultural land at home – certainly the Thera version of the foundation of Cyrene claims that a seven-year drought prompted the consultation of the Delphic oracle which instructed the Therans to colonize Libya (Herodotus, 4. 151). Alternatively, since the early

colonial ventures appear to coincide with the crystallization of the polis or “city state”, it may be that the inclusionary/ exclusionary process through which the community of citizens emerged inevitably resulted in social disaffection on the part of those who found themselves excluded or dissatisfied: in the Cyrenean account concerning the origins of Cyrene, the founder Battus is said to be the illegitimate son of a Theran aristocrat and a Cretan princess (Herodotus, 4. 154–55), and similar imputations of illegitimate birth may be inferred from the name of the Spartan Partheniai (“maiden-born”) who are said to have colonized Tarentum (Strabo, 6. 3. 2).

It is most unlikely that prospective colonists were entirely ignorant of their destinations. A small quantity of Protogeo-metric (10th-century) material has been recovered in the region of Tarentum while Greek cups dating to Middle Geometric II (early 8th century) are attested at Etruscan Veii; Cumae, Capua, and Pontecagnano in Campania; Scoglio del Tonno in Puglia; and Villasmundo in eastern Sicily. This would suggest either direct knowledge of the west on the part of Greek traders or at least indirect knowledge passed to Greek manufacturers by mercantile middlemen (probably Phoenicians). In some instances colonies were established on virgin soil (e.g. Pithecusae) – sometimes with the explicit blessing of neighbouring indigenous populations (Megara Hyblaea, Cyrene) – though on other occasions the colonizing effort required forcible occupation of the land (Thasos) and often subjugation of the former population (Syracuse, Heraclea Pontica). Though a matter of controversy, it is probable that intermarriage fostered greater integration between new colonists and indigenous populations: Herodotus (1. 164–65) states that wives accompanied the Phocaeans who attempted to colonize Corsican Alalia, though in his description of the foundation of Cyrene (4. 153) – as well as the Athenian “colonization” of Ionia (1. 146.2–3) – there is mention of men only so the likelihood is that the colonists, who were normally young men, took indigenous wives upon their arrival at colonial sites. Diodorus of Sicily (5. 6. 5) explains that the native population of Sicily eventually adopted the Greek language and educated their children according to a Greek model and it is this “Hellenization” of Sicily and south Italy that would later exercise such a profound influence on the culture of the Romans.

Colonization continued – albeit on a reduced scale – throughout the Classical period. In the early 5th century eastern Locrians established a colony at Naupactus; in the 440s BC Athenians settled Brea in Thrace and participated in the collective foundation of Thurii on the site of ancient Sybaris in southern Italy; and in 426 BC the Spartans issued a general invitation for Greeks (with the exception of the Ionians, Achaeans, and some others) to join them in the foundation of Heraclea

Trachinia in central Greece (Thucydides, 3. 92). For the first time, contemporary literary and epigraphic testimony reveals the precise workings of colonial ventures in this period, from consultation of the Delphic oracle seeking approval for the expedition to the provisions for choosing an *oikistes*, recruiting colonists, and formalizing the relationship between the mother-city and its colony as well as providing for the right of return in the event of colonial failure. It is debatable whether the practices attested in this period had also operated in the case of the earliest colonies: the literary accounts for the earlier foundations which were first consigned to writing at this time (though they are frequently preserved only in later sources such as Diodorus of Sicily) are characterized by recurring tropes – many focusing on the “outsider” status of the *oikistes* who is directed to found a colony when consulting the Delphic oracle on a completely unrelated matter – and it is tempting to believe that individual traditions were selectively moulded to fit this new genre of foundation stories. Indeed careful reading of literary accounts reveals the existence of multiple traditions in which colonial origins are attributed to varying populations and *oikistai* (both mortal and heroic) and oracular sanction sought from other sanctuaries besides Delphi. Colonial traditions were never transmitted for their own sake but to justify and legitimate claims to power and recognition in the present.

From the end of the 6th century BC, Athens began to found a new type of colony named a cleruchy. Although ancient authors often fail to make any terminological distinction between a cleruchy and a colony, the chief difference would appear to reside in the fact that, while colonies were normally established as autonomous foundations, residents of a cleruchy remained Athenian citizens, though the situation is complicated by the fact that later residents of Athenian colonies also often retained citizenship at Athens. In general, the function of the cleruchy seems to have been to act as a garrison over populations that were deemed hostile to Athens. Cleruchies were established at Chalcis and Salamis in the late 6th century; Andros, Chersonesus, Lemnos, Imbros, and Histiaea in the mid-5th century; Aegina, Lesbos, and Melos in the last third of the 5th century; and Samos in the mid-4th century.

A renewed wave of colonization was initiated by Alexander the Great and his Hellenistic successors, especially in Babylonia (Seleucia on Tigris), northern Syria (Antioch, Apamea), Asia Minor (Laodicea), and central Asia (Ai Khanoum). These colonies normally served the function of garrisons and were populated by both Greeks and Macedonians, though the new city of Alexandria, founded west of the Canopic mouth of the Nile Delta in 331 BC, was granted full civic status. Its original citizens were Greeks of various origins, but the city

also had a large indigenous Egyptian and Jewish population.

Comedy

Greece has furnished us with the earliest literary examples of comedy. As a form of popular entertainment, Greek comedy is probably of greater antiquity than tragedy. The origin of the word has been connected with *komos*, meaning "a band of revellers". Their processions, with unrestrained singing and jesting, were held in honour of Dionysus, so that comedy or "the song of the *komos*", like the tragedy and the satyr play, may have had its origin in the festivals of Dionysus. Tradition attributed its invention to the Dorian inhabitants of Megara, from where it was supposed to have spread to other Dorian communities.

In chapters 4 and 5 of the *Poetics* Aristotle gives a rather cursory account of the origin and development of comedy. The gist of his account is: the Megarians, both of Sicily and of the isthmus, claim to have originated comedy; its name is (erroneously) derived from *kome* ("village"); its origin lay in the preludes to the phallic songs; the steps

by which it developed are uncertain; the Sicilians introduced plots in place of mere lampoons; and comedy took longer than tragedy to receive recognition in Athens.

The transformation of the local Doric farce of Sicily into a literary form is attributed to Epicharmus of Cos (c.540–450 BC). Other representatives of early Dorian comedy appear to have included his contemporary Phormus or Phormis and Dinolochus, said to be a pupil of the latter. The introduction of comedy to Attica (c.580 BC) is credited to Susarion, who is said to have transplanted it to the Attic deme of Icaria, which is known to have been the principal centre of the worship of Dionysus in Attica, and the home of Thespis, the pioneer tragic poet, as well as of Chionides and Magnes (c.550 BC), who are said to have given Megarian comedy a more artistic form. Its adoption at Athens during the time of the Persian Wars ensured for comedy a place in literature. At Athens comedy became an official part of the celebration of Dionysus in 486 BC.

The evidence suggests that the ingredients of the old Attic comedy came from sources widely differing in place and time. The existence of “animal choruses” is attested by an Attic black-figure amphora of the mid-6th century BC, which depicts men disguised as horses, with riders on their backs, accompanied by a flute-player, and a 5th-century Attic vase showing men dressed as birds. Vases of the 6th century also depict grotesque satyrs as well as dancers whose dress is exaggerated behind and in front for humorous effect. The unrestrained personal abuse and gross sexual humour are anticipated in the poems of Archilochus (7th century BC) and Hipponax, and need not be traced solely to Dionysiac rituals. The dramatic element may have been derived from the secular Dorian comedy without chorus that is said to have originated in Megara and been developed by Epicharmus at Syracuse.

The earliest phase of ancient Greek comedy is known as “Old Comedy”. In practice, this term refers to the comedies produced at Athens during the 5th century BC. These plays are characterized by unrestrained satire of public persons and affairs, extremely irreverent treatment of mythology and the gods, outspoken political criticism and comment on literary and philosophical matters, as well as sexually oriented humour. The actors wore grotesque masks, and their costumes, though based on the dress of everyday life, included artificial exaggeration for comic effect. The short tunic could expose the large phallus each carried. They also wore masks of certain easily recognized types. Female roles were played by men. Accordingly, nude or exposed women must have been costumed representations of the female body. Although Old Comedy transformed ritual into art, it still retained traces of its ritual origin: the prominence given to the

phallus in the earlier plays; the final festive union of the sexes in a party or marriage; and the expressed or implied references to the reproductive organs.

The heyday of Old Comedy was during the time of Pericles and the Peloponnesian War when Athenian democracy had reached its highest point of development. Cratinus (c.520– c.423 BC) and his younger contemporaries Eupolis (c.446– c.411 BC) and Aristophanes are believed to have been the foremost writers of Old Comedy. Others include Crates, Phere-crates, Hermippus, Teleclides, Phrynichus, Ameipsias, Plato (not the philosopher), and Theopompus.

The plays were composed of a blend of song, dance, personal invective, and buffoonery, and consisted of loosely related episodes. The plot was set in contemporary Athens. In most plays of Aristophanes the protagonist conceives a fantastic plan that runs counter to the natural order of things. He is opposed by the chorus whom he eventually succeeds in winning over to his side. A series of short episodes then demonstrate the consequences of the realization of his fantasy for various professions and types, usually involving a series of acceptances and rejections, and the play usually ends in a festive spirit.

From a consideration of the 11 extant plays of Aristophanes (9 of which happen to be the only completely surviving examples of Old Comedy), we may infer that, gradually, a six-part structure evolved: (1) a *prologos* or introduction in which the basic issue of the play is explained and developed: the protagonist conceives an extravagantly imaginative but absurdly impractical solution to a problem; (2) the *parodos* or entry of the chorus; (3) the *agon* or contest between opposing principals, in which the hero defends his bright idea from attacks and invariably defeats his opponents; (4) the *parabasis* in which the chorus, on behalf of the poet, speaks to the audience and attacks prominent citizens: it consisted of an anapaestic passage followed by the *pnigos* (a long sentence to be uttered in one breath), an *ode* or invocation to a god, an *epirrhewa* or satiric speech on current affairs, an *antode*, and *antepirrhema*; (5) a series of *epeisodia* or farcical scenes, usually without any sequential connection with each other but building up to a climax, lightly separated by songs of the chorus, demonstrating the consequences of the realization of the hero's fantasy both on the protagonist and on typical figures, but occasionally carrying on the main plot; (6) *exodos* or final scene of rejoicing generally leading up to a banquet or wedding.

Attic comedies, like Attic tragedies, were performed at the great festivals of Dionysus, namely, the Dionysia and the Lenaia. Their inclusion in the latter dates from shortly before 440 BC. Five comic poets competed on each occasion, each presenting one play (the

number of competitors was evidently reduced to three during the Peloponnesian War, but this has been debated). In the 4th century comedies were also given at the rural Dionysia, but it is not known how far back this practice went.

Like a tragedy, a comedy consisted of the dramatic dialogue (for which the iambic trimeter was generally used) and the lyrical choruses. However, whereas the tragic chorus consisted of 12 (later 15) singers, the comic chorus included 24. They were often divided into two half-choruses. They wore masks and grotesque dresses to suit their parts (e.g. as birds, wasps, etc.), but removed their outer cloaks for the purpose of their dances. Their role was not generally one of reconciliation, as in tragedy, but of exciting the disputants and finally siding with the victor. On occasion, the entry of the chorus presents a moment of violence and excitement. It may be hostile to the protagonist who is faced with the task of winning them over to his side. Once this has been achieved, they applaud and reinforce what he says and does. The chorus played an important part in the Old Comedy, and, at least in the case of Aristophanes, several of the plays were named after their choruses.

The freedom of political criticism enjoyed by poets of the Old Comedy appears to have been occasionally curtailed, but it was not permanently lost until the downfall of Athenian democracy in 404 BC. The loss of imperial power and political energy was gradually reflected by a choice of material of a less typically Athenian and more cosmopolitan nature. Most notable is the reduced importance of the comic chorus. The *para-basis* disappeared altogether, and the choral odes were replaced by interpolated pieces (*embolima*) not germane to the play.

The term "Middle Comedy", which is of Hellenistic origin, has been used to designate Attic comedies written between c.404 and c.320 BC. The term is used to describe these plays because they represent a transition from Old Comedy to New Comedy, both of which have certain features in common with it. Although plays with political themes were still produced, mainly (but not exclusively) in the earlier part of the period, and politicians such as Demosthenes and Callimedon were frequently ridiculed, broadly speaking Middle Comedy avoided outspoken political criticism and open attacks on individuals, and dealt instead with typical human faults and foibles. The authors concentrated on social satire and resorted to burlesque or parody of tragedy, mythology, and the lives of the philosophers, notably Plato and the Pythagoreans.

The observation of contemporary types, manners, and pursuits was a common characteristic. Typical characters of New Comedy, such as bullies, parasites (evolved from the flatterers of Old Comedy), cooks,

pimps, soldiers, stern old men, young men in love, and courtesans figured in Middle Comedy as well, although some of them, such as the swaggering soldier, can be traced back to Old Comedy at least. Their occurrence leads us to conclude that New Comedy-type plots were also anticipated in Middle Comedy. Significant also in this connection is the impact of Euripides' plays such as the *Iphigeneia in Tauris*, the *Ion*, and the *Helen*. Middle Comedy represents a period of experiment and transition. Different types of play appear to have predominated at various times, so that one may not be justified in labelling one type of play as Middle Comedy to the exclusion of all others.

The most celebrated authors of Middle Comedy were Anti-phanes of Athens and Alexis of Thuri, followed by Eubulus, Timocles, and Anaxandrides of Rhodes. It is interesting to note that many of the authors were of non-Athenian origin. They appear to have been extremely prolific. More than 800 of their plays are said to have survived as late as the 2nd century AD. Athenaeus, who has preserved the majority of fragments, mentions some 57 playwrights. However, no complete example has come down to us, but the last play of Aristophanes, the *Plutus*, no doubt reflects some of the changed features.

The period of New Comedy extends from about 320 BC to the mid-3rd century BC. Its main features are the representation of contemporary life by means of imaginary persons drawn from it, the development of plot and character, the substitution of humour for wit, and the introduction of romantic love as a theme. These plays were written largely during a time of political and moral disillusionment, when Athens was no longer a free state but had come under the sway of Macedon. Political references are rare and are subordinate to the depiction of the domestic life of fictitious characters.

New Comedy offers a mildly satiric view of contemporary Athenian society, especially in its familiar and domestic aspects. There is no parody of public figures and events as in Old Comedy. Instead we meet with representations of the private affairs of average but fictitious men and women depicted without supernatural or heroic overtones.

The common subject is the infatuation of a high-born young man for a slave girl. One of the lovers is usually a foundling, the discovery of whose true birth and identity finally makes their union possible. But the romantic element is not the only ingredient and is not very significant: the girl whom the hero wishes to possess does not always appear on stage, or when she does, she often does not speak. Intrigue (especially on the part of crafty slaves on behalf of their young masters) plays an important part in the plots of New Comedy, which are articulated to a far greater extent than those of Old Comedy. The

names of the slaves (Getas, Libys, etc.) reflect the economic expansion in the wake of Macedonian conquest. The resulting cosmopolitan atmosphere is matched by the mobility of the people, who constantly go abroad, be it on business, mercenary service, or as the result of misfortune. Although the characters have fixed names and masks, they differ vividly and come to life as individuals, at least in the better plays. Athenian laws of citizenship and marriage are integral to many of the plays. Yet the universality of the characters, situations, and relationships makes the plays enjoyable to those far removed from Athens in time and place. Menander, in particular, excelled at the sympathetic portrayal of various personal relationships and problems arising from ignorance, misunderstanding, and prejudice, in all of which one can recognize his debt to Euripides.

The dialogues of New Comedy are in the usual iambic trimeter, but there are trochaic tetrameters and lyrical passages too that may have been performed by the actors themselves. The chorus is so diminished in importance as to become a small band of musicians and dancers periodically providing light entertainment. The language is Attic, but closer to the koine of everyday speech. The play was apparently divided into five acts by the four choral interludes.

The most famous exponent of New Comedy was Menander (342–292 BC). His surviving work includes one complete play, the *Dyscolus*, and considerable portions of three others: *Perikeiromene*, *Epitrepontes*, and *Samia*. Some of his other plays, as well as those of his fellow New Comedy writers (Diphilus, Philemon, Philippides, Posidippus, Apollodorus of Carystus), are known to us only through their Latin translations and adaptations by the Roman comic poets Plautus (c.254–184 BC) and Terence (195/185–159 BC). The original Greek texts circulated widely until the 7th century AD, but were then completely lost. Until the discovery of the Menander papyri, New Comedy was known only through quotations, Roman adaptations, and echoes in later Greek authors such as Alciphron and Lucian.

Constantine I the Great 273/74–337

Emperor

Constantine the Great was born in Naissus (modern Niš, in Serbia) in 273/4, the son of the future emperor Constantius Chlorus and Helena his concubine (or perhaps wife). From 293, when his father became a member of the tetrarchy, as Caesar to the Augustus Maximian,

Constantine served in the Roman army in the eastern part of the empire, first fighting in the Persian war and later serving with Galerius on the Danube; thereafter he seems to have been attached to Diocletian's court. The "Great Persecution" of the Christians began in 303, though in the west it was less severe than in the east, and in Gaul and Britain, where Constantius held sway, the persecution seems to have been limited to the demolition of churches. In 305 Diocletian, then seriously ill, and the other senior emperor, or Augustus, Maximian, resigned and were succeeded by their Caesars, Galerius and Constantius. Constantine (and Maximian's son, Maxentius) was passed over in the succession; two of Galerius' favourites, Severus (possibly his praetorian prefect) and Maximinus (his nephew), became Caesars.

After the reconstitution of the tetrarchy in Nicomedia, Constantius left for Britain, soon followed by his son. On 25 July 306, at York, Constantius died, and Constantine was immediately hailed by the army there as Augustus, his father's successor. He immediately announced his assumption of the imperial dignity to Galerius, the other Augustus, who compromised by appointing him Caesar, a position Constantine did not refuse, thus assuring beyond any doubt his legitimacy. The ensuing dissolution of the tetrarchy was a complicated business. Maxentius, initially with the support of his father, proclaimed himself Augustus in Italy. After Severus' failure to defeat Maxentius, Galerius appointed Licinius to the task, as Augustus. Galerius himself died in 311, having issued an edict of toleration, bringing to an end the persecution of Christians in the east. The following year Constantine advanced into Italy. On 28 October Maxentius left Rome and crossed the Tiber to confront the forces of Constantine. At the Battle of the Milvian Bridge he was defeated, and Constantine entered the city as the undisputed ruler of the western Roman empire. Rule of the eastern empire was now disputed between the two other Augusti: Maximinus, who had begun persecuting Christians again in Egypt and Palestine, and Licinius, whom Constantine supported. In 313 Constantine and Licinius met in Milan and extended to the whole empire the toleration Christians were already enjoying in the western part of the empire. Later that year Licinius defeated Maximinus. Harmony between the two Augusti, Constantine and Licinius, did not last long. There was an indecisive war in 316, and in 324 Licinius was finally defeated by Constantine, who thus became sole emperor, which he remained until his death.

Constantine's victory over Maxentius in 312 was presented in Constantine's propaganda as a victory for Christianity (though there is evidence that Maxentius supported the Christians too), and very soon there circulated stories that before the battle Constantine had had a dream (so Lactantius), or a vision in the sky (so Eusebius), in which he

had seen the cross as an emblem of victory, which he was to use as his military standard: the *labarum*, bearing either the chi-rho or the *crux monogram-maticum* (so Lactantius, who says that it was inscribed on the shields of Constantine's soldiers). This dream or vision is presented as Constantine's conversion. There is in fact evidence that Constantine was far from unfamiliar with Christianity: the name of one of his half-sisters, Anastasia, may indicate longstanding Christian leanings in his family, and Constantine seems to have included Christian bishops in his entourage before the victory of 312. It is, however, clear that after 312 Constantine adopted Christianity as his favoured religion and made it the object of his considerable patronage. There is also evidence from coinage that like his father he maintained his devotion to *sol invictus*, the "unconquered sun", but it is not unlikely that, like later Roman Christians we hear of from pope Leo I (440–61), he had no problem in assimilating Christ and the *sol invictus*. As to the motives for his conversion, there is continuing scholarly dispute over whether it was a response to the growing Christianization of the empire, or a precondition for its ensuing Christianization. The pagan rumour (preserved by Zosimus) that Constantine embraced Christianity as the only religion that could offer forgiveness to one who had murdered his wife and son in 326 is perhaps not entirely without foundation. At any rate, Constantine only became a baptized Christian on his deathbed in 337.

Constantine's support for Christianity is manifest in his providing funds for the building of churches, initially in the west, but soon in the east, and also in the introduction of changes in the law to meet Christian sensibilities (for instance recognizing bishops as legitimate legal arbiters). It is perhaps also manifest in his founding in 330 the city of Constantinople, named after him, or "New Rome". However, Eusebius' account of Constantine's planning a Christian city with many churches is not borne out by the surviving evidence: it seems that the only church begun by Constantine was the church of the Holy Apostles, intended as his mausoleum where his body would rest as that of the 13th apostle. The Christian Church, the object of Constantine's favours, very soon presented problems for him. In north Africa he found a Church divided by Donatism, and quickly discovered that Christian disunity was not easily dealt with. Even worse, when he had attained his ambition as sole emperor in 324, he found the Church in the east divided over the issue of Arianism. To solve this he convoked a synod, the first Council of Nicaea, which within a decade or so was to be regarded as the first ecumenical (or universal) council: Arius was condemned and the Christian faith defined in a creed (or symbol) drawn by the council. Constantine's involvement in the affairs of the Church has often been seen as the

beginnings of Caesaropapism, though it has recently been forcefully argued (by Barnes) that Constantine and his immediate successors were scrupulous in respecting the government of the Church by bishops meeting in synod. Despite the clear decision of the Council of Nicaea against Arianism, Constantine seemed to compromise in his later years (at least in the eyes of the Orthodox) and received baptism from the hands of an Arian bishop, Eusebius of Nicomedia.

Constantine's reputation as the first Christian emperor was enormous: more of his successors bore the name of Constantine than any other, the last dying in defence of the city Constantine had founded in 1453. The vision of the cross that was the occasion of his conversion led to its becoming a symbol closely associated with Constantine (and the imperial office), which was enhanced in legend by his being closely associated with his mother Helena's discovery of the True Cross in 326. The shadow cast over his name by his having been baptized on his deathbed by an Arian was removed by the legend that he was baptized in Rome after his victory at the Milvian Bridge by pope Sylvester I. He is commemorated as a saint in the Orthodox Church, together with his mother Helena, on 21 May.

ANDREW LOUTH

Biography

Born at Naissus in Serbia in 273/74, the son of Constantius I and Helena, Constantine served in the Roman army from 293. When Constantius died at York in 306, Constantine was proclaimed as his successor by the troops there. After victory at the Milvian Bridge in 312 he entered Rome as ruler of the western part of the empire; and in 324 became sole ruler of the whole. Constantine was a supporter of Christianity and in 330 founded the city of Constantinople as a new, Christian, capital. He died near Nicomedia in 337.

Contraception

Ancient and medieval Hellenic peoples employed contraceptive drugs administered topically and orally as one of a variety of means of birth control. Soranus (*fl.* AD 98–117) said that “a contraceptive (*atokion*)

differs from an abortive (*phthorion*), for the first does not let conception take place, while the latter destroys what has been conceived.” Even though the Greek language distinguished conceptually between contraception and abortion, writers often mixed the two actions, according to modern scientific nomenclature. Generally the pharmaceutical actions were hormonal, usually stimulating or decreasing either oestrogen or progesterone, resulting either in contraception or disruption of implantation. The latter we call an abortifacient, but to early Hellenic people the distinction was not so sharp. In ancient and Byzantine times it was thought that the sperm remained in the womb for a period of weeks before acceptance and foetal formation.

Plato and Aristotle regarded population control as a function of the state, whereas Polybius and other Hellenistic figures thought that a decline in Greek influence was attributable to decisions by families to have fewer children. Medical sources regarded contraception as preferable to abortion because of the relative safety of the former. A Homeric hymn, for example, thought that Zeus permitted the Trojan War because the earth had too many people. In the Greek myth, Persephone was told not to eat anything but she disobeyed by eating a pomegranate, a widely used contraceptive in Greek and earlier Near Eastern cultures.

The most famous contraceptive was silphium, the name given to a small tree of the *Ferula* genus, whose contraceptive qualities were discovered and marketed by Greek colonists in Cyrene. The Cyreneans enjoyed a virtual monopoly because attempts to transplant and cultivate it failed. By the 1st century AD the plant was very scarce and expensive. The last reference to it occurs in a letter by Synesius of Cyrene (4th century) who reported that his brother had some growing on his farm. The plant is known to have been an effective contraceptive because plants of related species that later Greeks substituted for the extinct silphium have been proven to be effective contraceptives in animal and human testing.

Coitus interruptus was seldom employed as a contraceptive measure to judge by the paucity of references to it. Those few references, however, indicate that the procedure was known. Barrier methods were not known. Some pessaries prepared as drug prescriptions with specific ingredients and administered on wool pads could possibly have resulted in mechanical blockage of sperm progression. The Hippocratic work *On Generation* (5. 1) said that the practice was for women who did not wish to have a child to expel “the sperm from both partners”. Contrary to a number of philosophers, Aristotle regarded males as the sole providers of sperm, and hence the source of life, with women supplying only nourishment.

Magical devices in the form of amulets, talismans, and incantations were employed as contraceptive means. Soranus, the gynaecologist of the early 2nd century, ridiculed such means, although Galen and other Greek medical writers sometimes included these devices among the contraceptive prescriptions. The anomaly is that from the standpoint of modern pharmaceutical knowledge the drug prescriptions were to some degree effective. For example, Aetius of Amida (*fl.*^{AD} 502–25) attested to the efficacy of wearing weasel liver, this among otherwise perfectly rational medical lore.

The existence of male contraceptives was known but seldom were details related. Dioscurides (*fl.* c.^{AD} 50–70) related that a plant called *periklymenon* was a male contraceptive, but this plant has never been identified. In Talmudic sources there are references to unspecified root poisons that prevent conception when used by both males and females. Galen said that the chaste tree (*Vitex agnus-castus* L) was employed by athletes and certain priests to prevent erections. Recent tests using an extract of the plant show that in dogs its action is to disrupt sperm production. The paucity of references to male contraception, however, probably indicates a seldom-employed practice.

Copais, Lake

Drained lake in Boeotia

Lake Copais is the fourth in a series of basins in a great valley running with the river Kiphisos from west–northwest to east–southeast for some 130 km. The corridor is separated from the Gulf of Corinth to the south by the ranges of Mount Parnassus and Mount Helicon, the latter directly south of lake Copais. The lake was formed through crustal disturbance and enlarged through erosion and dissolution of

the surrounding limestone. It was fed by the waters of the Kiphisos, which then progressed towards the sea through limestone ridges and the lakes Iliki and Paralimni. Sedimentation in the lake bed led to an increasing shallowness of the water; before 1886, seasonal changes in temperature caused an alteration between lake in winter and swamp in summer.

Archaeological survey and excavation have revealed Palaeolithic and Neolithic occupation around the lake, and shown that the region was relatively densely inhabited in the Bronze Age. Tradition recorded by Strabo (9. 415) and by Pausanias (1.9. 3, 8. 33. 2, 9. 38. 7) held that the “Minyans” (after the mythical king Minyas) had drained the lake and cultivated the plain. The archaeological evidence for the drainage of the lake rests on two bases: observations of dykes, drainage, and canal works in and around the lake, and an apparent system of fortified enclosures or settlements encircling the lake.

The known ancient drainage works include two immense canal projects: one canal was created on the south and east side of the lake, the other on the north side; these were united at Agia Marina, in the northeast corner of the lake and about 1 km north of Gla. These canals are breathtaking examples of Mycenaean hydrological engineering works. With a combined length of over 50 km, they seem to have been designed to channel the waters of the Kiphisos and Melas rivers, and perhaps of smaller tributaries, away from the central bed and towards the north and east, where natural sink holes take the water to the sea. The canals are massive, in correspondence to the volume of water involved. At one point on the southern route the channel is 41 m wide and enclosed on one side by a dyke 19 m thick. Where the two routes meet, the channel is as much as 60 m wide. Archaeological investigations have been sporadic, but where observations have been possible the dykes have been revealed to be stone-built constructions.

Gla is the largest of a series of Mycenaean fortified sites around the lake. In the northeast section alone three other fortified sites overlook the plain, and elsewhere they include a fort at ancient Haliartos overlooking the southern channel and several sites on the north side. Although Gla is the only one of these sites to have been seriously investigated, the indications are that, with Gla, all of these sites were founded in the Mycenaean heyday and their period of use did not extend much beyond the end of the Mycenaean palace period. This suggests very strongly that the entire system of fortified sites and drainage projects formed a cohesive unity in draining, maintaining, and protecting the lake bed.

Gla is by far the largest of Mycenaean fortified sites, enclosing an area ten times that of Mycenaean Athens or of Tiryns, and seven times that of Mycenae itself. A massive Cyclopean wall generally 3 m thick

runs for 2.8 km around the perimeter of a rocky outcrop that would have been an island before the lake was drained. It is pierced by four gates, one of them double; from two of these gates, roads have been traced for some distance into the plain, further proof of the effectiveness of the drainage operations. The enclosed area, nowadays barren rock and scrub, appears to have been relatively open in Mycenaean times: only a central portion in front of the southern gate and running to the north wall was built upon. Part of this appears to have been taken up with stables and storerooms. Towards the north, where the rocky islet reaches its summit, an L-shaped block of rooms forms what is assumed to have been the administrative and perhaps religious centre of the site. These rooms, generally small, were plastered and painted and show some of the refinements of Mycenaean palatial architecture. The built area occupies less than one quarter of the enclosed area of Gla; it may be that temporary structures occupied the rest of the area, especially during the construction phase of Gla itself and the drainage projects in the lake.

Important Mycenaean sites are located at Thebes to the southeast and Orchomenus to the west. Recent fieldwork suggests that hydrological works extended as far as Orchomenus in the form of a small artificial lake created in the vicinity of the town. Orchomenus is thought to have been the site of a Mycenaean palace and certainly boasted the greatest of all tholos tombs, the Treasury of Minyas, which was modelled on the Treasury of Atreus at Mycenae. It seems logical to assume that the drainage of Lake Copais was orchestrated from there, and that, beginning with Gla, a number of fortified settlements were constructed to maintain and control the drainage system and the agricultural land that resulted from it. If Thebes were in any way a hostile centre, that would further explain the fortifications.

By the historical period the drainage system seems largely to have collapsed, probably in the wake of the collapse of Mycenaean political structures c.1200 BC. Sporadic attempts were made either to repair the system or to undertake new drainage projects, some of which may well have been smaller-scale but nevertheless successful. Crates of Chalcis, under the tutelage of Alexander the Great, is supposed to have attempted to drain the lake; perhaps the most striking remnant of this period is a tunnel at the northeast end of the lake, unfinished but destined to carry the waters off to the sea in much the same direction that the (presumably blocked) sink holes had done in previous years. Other repairs were undertaken in the Roman period, but it appears that the lake was never again drained in any systematic manner; instead small-scale, localized projects were undertaken.

Copper and Tin

Copper was one of the earliest metals to be exploited, partly for its metallurgical qualities, but also because, like gold, it can occur in nature in its native form. However, the native metal was never a major ore in antiquity and it was an important step when it was realized that copper could be produced from other disparate-looking materials. The earliest copper production probably began in the Sinai peninsula, but the most important source of copper in the Bronze Age was the island of Cyprus. There were no major sources of copper in mainland Greece that were exploited in antiquity, although recently it has been mined on the Chalcidice peninsula. Other minor sources were in Anatolia and Palestine.

Initially, copper was used in its pure state to make tools and weapons. However, the usefulness of this material was limited by its relative softness. It was only when it was discovered that the hardness could be increased by alloying with arsenic, and later tin, that bronze became widely used, principally in armour, weapons, bowls, tripods, statuary, and tools. It was always an expensive material as all the ingredients had to be imported. It was eventually partly supplanted by iron and steel, possibly in response to a shortage of tin.

Copper production started on Cyprus in the Chalcolithic Age, 3800–2500 BC, but only reached its peak during the late Bronze Age, 1600–1100 BC. The predominance of Cyprus was due to the richness of the ores, and their early discovery. The earliest ores to be exploited were from colourful altered zones on the surface – iron and copper-rich rocks called gossan. However, the early Cypriots discovered that beneath many of the gossans lay rich deposits of primary sulphide ore, that were easier to work than the deposits on the surface. Every

gossan on the island was explored for copper at this time. Production was at its maximum in the early 13th century BC, when the characteristic “oxhide” ingots were produced. The coming of the Iron Age reduced the importance of copper, but exploitation continued until the end of the Roman empire. The only ancient description of copper exploitation was given by Galen, the Roman physician, in AD 162.

The ancient mines and smelters were centred around Skouriotissa and Kalavassos. The volume of the slag heaps indicates that about 200,000 tonnes of copper was produced, mostly before Roman times. The mining was mostly underground, at depths of 185 m. Water pumps have not been found, hence the mines must have been constructed to drain naturally.

The copper deposits of Cyprus formed on the ocean floor, which was lifted up to form the Troodos mountains during the convergence of Africa and Europe. The upper part of the ocean floor was formed by volcanic eruptions of basalt. Ocean water circulated through these piles of hot lava and dissolved some of their minerals. Where these hot springs debouched, underwater cooling caused precipitation of the dissolved minerals to build chimneys and mounds – these are the well-known hydrothermal vents, or “black smokers”, still to be found at mid-ocean ridges, particularly in the Pacific. These chimneys are rich in sulphide minerals, such as pyrite and chalcopyrite, the main copper mineral. The copper ore of Cyprus always contains a little gold, but not usually enough to be exploitable. However, some gold was concentrated during weathering of sulphide deposits on the sea floor to produce ochre. This was exploited for gold in antiquity, but was never a major source of the metal.

The copper ores were smelted in several steps. The sulphide ore was roasted in air to convert it to the oxide. This was mixed with a flux of quartz and iron-manganese oxides (umber), to increase the fluidity of the molten material, and charcoal to react with the oxygen and convert the oxide to the metal. The raw metal was refined by remelting and cast in “oxhide” ingots weighing about 20 kg.

Copper has many useful qualities, but it is not a hard metal. This is why the discovery that the hardness of copper could be improved by alloying with other metals was so important. The first alloys were with arsenic. This occurs with copper at a few deposits in Cyprus (Pevkos, Laxia tou Mavrou), and smelting would have made a natural alloy. Later it was found that the addition of tin made the best bronze. This discovery was long in coming, partly because tin and copper occur together so rarely.

Most deposits of tin are associated with granite. The main ore mineral is the oxide, cassiterite, which crystallizes in the granite itself

or from watery fluids released during crystallization. This heavy, resistant mineral is released when the rock is weathered and can be concentrated in river sediments in the same way as gold. Such placer deposits were easily exploited once the value of the mineral was determined. There are no major sources of tin in the Aegean region. A minor source in eastern Turkey was exploited in the Bronze Age, but most tin must have come from much more distant sources. There are minor deposits of placer tin in the Eastern Desert of Egypt, but tin-bronze was not used there before 2000 BC, and there is no evidence that it was exported. One possibility is that tin came from Malaysia, a region still rich in tin today. Later on, the Iberian peninsula became an important source. Southwest Britain may have been another source – it was certainly exported from there by Roman times. Cassiterite was smelted by heating with charcoal.

Another important copper alloy is brass. This copper-zinc mixture seems to have been known in Greece from about 700 BC, possibly by the name *oreichalkos* (copper of the mountain). Early brass may have been made by smelting natural mixed copper-zinc ore, possibly in Cyprus or Asia Minor, but it is difficult to get much zinc into the copper by this process. Later on, high-zinc brass must have been made by deliberately alloying zinc and copper. This is difficult as zinc boils at a lower temperature than copper metals. It is possible by heating copper metal, zinc ore, and charcoal powders in a closed crucible at 920° to 1000°C.

Corcyra

Ionian island

Corcyra (Kerkyra in Greek) has never been as “far from the busy haunts of men” as the Scheria of the *Odyssey* with which, by Classical times, it was commonly identified. Its advantageous position on the

main trade route between Greece and Italy attracted Corinthian colonists (probably in 734 BC, certainly by about 705), the Eretrians from Euboea whom the Corinthians apparently expelled, and their many successors.

The main Corinthian settlement was on the Palaeopolis peninsula and included, by about 600 BC, an Archaic temple to Hera. Corcyra prospered rapidly and as a result became even more independent of the mother city than most Greek colonies; in about 664 BC it inflicted a naval defeat on the Corinthians. Nevertheless, the history of founder and colony continued to intertwine: they were co-founders of the colonies of Epidamnus (c.625 BC; Roman Dyrrachium; modern Durazzo and Dunës) and Apollonia (c.600 BC) in Illyria; for a time Corcyra was controlled by the Corinthian tyrant Periander (d. 586 BC); and conflict between the two states was a prelude to and a cause of the Peloponnesian War.

In 435 tension between Corcyra and Corinth, the result chiefly of the islanders' perceived lack of respect for the Corinthians and lack of interest in Greek affairs more generally, became an open quarrel over the affairs of Epidamnus. Broadly speaking, Corinth supported the *demos* (ordinary citizens) of Epidamnus and Corcyra reacted by supporting the oligarchs. Again the Corinthians were defeated at sea. Epidamnus was taken and Corcyra, for the time being at least, was established as the dominant power in the region. The islanders could not, however, afford to stand alone, given the place of Corinth in a pattern of powerful alliances, notably with Sparta. Therefore, in 433, they formed an alliance with Athens. To avoid breaking the existing Athenian entente with Corinth this was conceived as "defensive". But later, in 433, Athenian reinforcements played a crucial role in averting the defeat of the islanders by a Corinthian armada of 150 ships; the larger war – which broke out in 431 – became more likely.

In 427 BC Corcyra was riven by complicated civil war. Oligarchs and their supporters fought elements of the *demos*, who were themselves subject to internal feuding, and Athens, Corinth, and Sparta were involved both as aggressors and as mediators. When the Peloponnesians, having ravaged the south of Corcyra, had withdrawn, massacres of their supporters began; the Athenians, who had 60 ships offshore, did nothing to interfere. According to Thucydides, the victims "were accused of conspiring to overthrow the democracy, but in fact men were often killed on grounds of personal hatred or else by their debtors ... There was death in every shape and form ... Men were dragged from the temples or butchered on the very altars." For Thucydides these events provided a paradigm of the moral degeneration, cyclic violence, and collapse of law which would increasingly afflict all participants in the Peloponnesian War. In

Corcyra the fighting continued; there was a new Athenian expedition in 425 and further massacre.

The alliance with Athens was eventually ended in 410 BC but was re-established in response to Spartan activities in the Adriatic in 375. Interventions by other powers continued to be frequent; the Illyrians seized Corcyra but were expelled by Rome, whose overlordship the island perforce accepted, in 229. The island served as an important bridgehead for subsequent Roman campaigns in Illyria, Macedonia, and Greece.

Corinth

City in central Greece

The importance and fortunes of Corinth derive in the first instance from its position at the isthmus which bears its name; as Thucydides commented, not only did this mean that Corinth controlled the only land passage from southern Greece (the Peloponnese), to central and northern Greece, but it also gave the city access to the seas, to the Aegean and the east, via the Saronic gulf, and to the west, to the Adriatic, Italy, and Sicily, via the gulf of Corinth, thus placing the city in a most favourable position for trade.

There are prehistoric settlements in the vicinity, but none seem to be of any particular significance, and certainly do not compare to the main Mycenaean sites in the Argolid. Following the collapse of the late Bronze Age systems, Corinthia was another area into which Dorian settlers migrated, forming a small community below the conspicuous hill of the Acrocorinth, where the spring Peirene, with others, provided an abundant water supply. The place remained small until the 8th century BC, when it began to develop rapidly under the control of its principal Dorian clan, the Bacchiadae, a closeknit group who adhered more or less strictly to a custom of endogamy. Corinth then took over nearby communities, incorporating their land and sending part, at least, of their populations overseas to colonies, the most significant being Syracuse, founded probably in 733 BC. This Bacchiad supremacy lasted, according to later authors, for a period of

90 years (i.e. three generations) after which they were overthrown by a tyrant, Cypselus, the son of a female Bacchiad, Labda, and a member of another group called the Lapiths (who may have been non-Dorians): the breaking of the tradition of endogamy puzzled later Greeks, who explained it by guessing that Labda was physically unattractive. Whatever the reality, Cypselus and his son Periander consolidated the state in a reign lasting 70 years; the last of the dynasty, Psammetichus (significantly, an Egyptian name), was overthrown after ruling for only three and a half years. Thereafter Corinth had a restricted form of government, in which control was exercised by the landed well-to-do, almost certainly only a minority in the population, who therefore turned to Sparta, whose similarly restricted constitution made it the natural friend of states like Corinth. From this time Corinth was an important but essentially second-rate city. It continued its naval interests, forming in effect the fleet of Sparta. Later, in the early 4th century BC, the Corinthians turned against Sparta and in the process almost certainly broadened their constitution.

After the Battle of Chaeronea (338 BC), and following the defeat of Athens and Thebes, Corinth, or more particularly its extramural sanctuary of Poseidon at Isthmia, was chosen by Philip II of Macedon as the locale for the great conference he called to decide the future relationship between the Greek cities and himself; the result is popularly known as the league of Corinth. Probably in reality an instrument of Macedonian control, the organization lapsed in the wars of the Successors of Alexander, but was revived in 306 BC by Antigonus Monophthalmus who was the most powerful of them. For the whole of this time, and for much of the 3rd century, the Acrocorinth was held by a Macedonian garrison; part of the fortifications built by Antigonus' son, Demetrius the Besieger, are still visible, incorporated into the later medieval and Turkish walls. Corinth was one of the "fetters of Greece" and its liberation by Aratus of Sicyon, who incorporated the city into his Achaean League, was a serious blow for the Macedonians. The freedom of Corinth was finally secured by the Roman defeat of Philip V: the Roman commander, Titus Quinctius Flamininus, ironically – and knowledgeably – proclaimed the freedom of Greece at Isthmia, in the very sanctuary where Philip II had effectively ended it. The later disloyalty of Corinth, which took the Roman freedom too literally and participated in an Achaean counteraction against Roman domination in Greece, led in 146 BC to the destruction of the city by Mummius, and the ransacking of its works of art.

Yet the site was too important to be obliterated, and a century later the city was refounded by Julius Caesar, but as a Roman, Latin-speaking colony. Some of the buildings of the Greek city survived,

such as the 6th-century BC temple to Apollo, built shortly after the downfall of the tyrants. Others, such as the ruined long portico or stoa, to the south of the temple, were refurbished to serve as public buildings in the new city. The area between temple and stoa, which had been a gymnasium complete with a running course, became the forum of the Roman colony, with Roman-type temples constructed at its western end. The Roman colonists were presumably allotted estates, but it is clear that a Greek population still survived – St Paul wrote his epistle to the Corinthians in Greek, and in the course of time Greek ousted Latin. The city flourished. Although Athens was the academic centre of Roman Greece, Corinth was its political capital. This continued into the Byzantine period; one of the largest basilical churches in Greece was constructed at Lechaëum, Corinth's harbour on the gulf of Corinth. This prosperity persisted well into the middle Byzantine period, after which it suffered a sharp decline. There was a revival in the 10th century AD, and subsequently. Corinth was occupied by the Franks, and recent excavations are beginning to reveal good-quality buildings of this period. The final decline came with the Turkish occupation (1460). Acrocorinth, still a strategic key to the control of Greece, was refurbished and occupied by a Turkish garrison until the Greek War of Independence, but the town dwindled to an insignificant village. The revived Corinth of modern times was shifted to a more convenient location by the sea, on the gulf of Corinth.

Corinth's contribution to Greek civilization was considerable. Its trade links in the late 8th and 7th centuries BC both with the Near East and with the west not only brought it prosperity, so that its wealth was proverbial – “not everyone is fortunate enough to sail to Corinth” – but were also responsible, to a large extent, for the development of oriental motifs and forms in Archaic Greek art. Its painted pottery of this period seems to have been prized over a wide area (perhaps for the contents of the perfume flasks as much as their decoration) and is found ubiquitously. Less well preserved, but certainly more highly valued in antiquity, was Corinthian bronze ware. Much of this was buried in graves at Corinth itself, and after Mummius' sack of the city created a taste for Corinthian metalware in Rome. Nekrokorinthia – funerary items plundered from the graves – were highly prized by the wealthy Romans who could afford to collect them. Perhaps the most lasting contribution of the Corinthians was the creation, in the early 7th century BC, of the Doric order of architecture, for which the earliest evidence is at Corinth and Isthmia (the Corinthian order is later and developed elsewhere). All this impetus came in the crucial Archaic period. Though Corinth was less important later, its contribution to later civilization has endured to the present day.

Corinth, Sack of 146_{BC}

The sack of Corinth was the event that symbolized the end of Greece's autonomy in antiquity. Its destruction had its roots in the declaration of Greek independence made by the Roman general Titus Quinctus Flamininus at the Isthmian Games in 196_{BC}. After defeating Philip V, king of Macedon, in the Second Macedonian War, the Romans decided not to cripple the Macedonian kingdom because they had no imperialistic ambitions in Greece; rather, they wanted Macedonia to serve as a buffer against the powers in the east, the barbarians in the Balkans, and even Greece itself. The Romans thus granted Philip favourable terms, with the stipulation that he withdraw completely from Greece, and decreed that all Greek cities were to be free and governed by their own laws. The Greeks and Romans had conflicting views on what freedom (Latin: *libertas*; Greek: *eleutheria*) meant, however. The Greeks interpreted their newly bestowed freedom as complete autonomy and the absence of Roman interference in their affairs. The Romans, on the other hand, expected the Greek states to give them their loyalty and support. As Ernst Badian has shown, foreign policy was a microcosm of the patron–client relationship in republican Roman society, and the Greeks failed to perceive this. Whereas Rome expected cooperation and a sense of loyalty, the Greeks displayed a callous disregard for them and continued to carry out their centuries-old internecine wars and struggles.

Many Greeks resented Rome's settlement with Philip. Sparta, for example, was angry that it had lost the city of Argos, while the Aetolian League was embittered when it did not receive, as it had hoped, all of Thessaly but instead saw most of the territory divided into four separate confederate states. Relations between Rome and Greece quickly deteriorated, proving the folly of Rome's hands-off policy expressed by Flamininus at Isthmia. The Aetolians invited into Greece Antiochus III, king of Syria, who was quickly taken care of by the Romans in 191_{BC}: Antiochus' forces were overwhelmed at Thermopylae, forcing him to beat a hasty retreat to Asia Minor. The Third Macedonian War (171–168_{BC}), waged by the Romans against

Philip's son Perseus, proved disastrous for Greece. Although few Greek cities actually sided with Perseus, Rome's anger did not fail to fall on Greece. One thousand Achaeans were deported to Rome because of suspicious loyalty; 500 Aetolians were executed after a farcical trial; 70 Epirot cities were destroyed, with 150,000 of the population sold into slavery; and the island of Rhodes was economically crippled by the establishment of Delos as a free port.

The end of Greek independence was the result of the actions of the Achaean league. In 150 BC the surviving 300 of the original 1,000 Achaean detainees returned and found the League in conflict, yet again, with Sparta, this time over a boundary dispute. The Spartans, although members of the league, appealed to Rome for arbitration. The league, which could not tolerate such insubordination by one of its members, decided to punish Sparta; because Rome had not previously interfered with how it conducted its business, the league felt at liberty to bring Sparta forcibly back into its political alliance. Embassies from Sparta and the Achaean League went to Rome on three occasions, yet Rome did not respond, its hands too occupied with a revolt in Macedonia (150–148 BC) led by Andriscus, a pretender to the throne. In 148 BC Sparta declared its secession from the Achaean League, which then went on the offensive, quickly reducing Sparta to the brink of surrender. At this point a Roman embassy, led by Lucius Aurelius Orestes, arrived at Corinth to ask the league to see reason; Orestes even threatened (although he was probably bluffing) to dissolve the league by removing from the alliance the cities of Sparta, Corinth, Argos, Arcadian Orchomenus, and Heracleia-ad-Oetam. The reaction was furious, and a second Roman embassy, led by Sextus Julius Caesar, failed despite conciliatory overtures. In the spring of 146 BC Quintus Caecilius Metullus, the Roman general in Macedonia, sent yet another embassy to the league, which had assembled at Corinth. The envoys were rudely treated by the assembly, heavily composed of lower-class workers who, traditionally, were hostile to Rome because of its policy of supporting local aristocracies. The League then officially declared war on Sparta, although this was tantamount to war on Rome. The Roman Senate reacted by instructing Metullus to march south from Macedonia and the new consul, Lucius Mummius, to set sail for Greece with a fleet. As Erich Gruen has convincingly argued, the league was shocked and stunned by this development: in the past the Romans had not interfered in Greek internal struggles, and so the league had assumed that it was free to punish a city that had defected from its membership. But Rome's patience had worn out and foreign policy was no longer in the hands of men like the Scipios and Flamininus; more importantly, Rome could not tolerate a war in the Peloponnese at the very time that it was

settling affairs in northern Greece.

The league struck first by marching against Heracleia-ad-Oetam. Metullus soon arrived and cut the Achaeans to pieces in three separate battles. The league then ordered 12,000 slaves freed to serve as reinforcements to a ragtag army raised to defend the isthmus. Meanwhile Mummius had assumed command of the Roman army and met the Achaean army at Leucopetra on the isthmus. The Achaeans were annihilated, and Corinth was captured without resistance. Rome decided to make an example of it. All survivors were sold into slavery. The city was sacked, burned, and levelled to the ground, and its land declared *ager publicus* ("public land") and handed over to the neighbouring town of Sicyon to till. Anything that could be carried off was taken to Rome. Stories circulated of Mummius taking out "insurance policies" on priceless art treasures in the event of their being lost on the voyage home, and of soldiers playing dice on masterpieces of Greek sculpture. Greece itself was subjected to a "final solution". All leagues were dissolved, democracies were abolished and replaced by aristocracies, and the whole of Greece was put under the responsibility of the governor of Macedonia. Later, in 27 BC, the province of Achaia was established to govern southern Greece, although this merely formalized Greece's existing total subservience. Individual cities achieved varying levels of prosperity during the empire, but mainland Greece as a political concept no longer existed. Greek independence had come to an end, but so had hundreds of years of internal strife and war.

Coronation

The silence of literary sources about any ceremony of investiture of a new Greek ruler before the beginning of the Hellenistic period, when eastern influences began to be felt, attests to the simple assumption or seizure of power, perhaps celebrated by a banquet at which laudatory

speeches could be delivered. The exception is Macedon, since at least theoretically the king was elected there by acclamation of the army. A vestige of this practice persisted in Ptolemaic Egypt where, certainly until its severe ethnic adulteration in the early 2nd century BC, the Macedonian royal bodyguard retained the right of approval of new sovereigns.

Crowns (at least in the form of garlands) did exist in Classical Greece, but they were worn by priests in the exercise of their rituals, orators, and especially symposiasts. Initially vegetal, they came to be made of gold, and some delicate funerary examples of this latter type have survived. The awarding of crowns for excellence at athletic and dramatic festivals encouraged their increasing use as symbols of merit in other spheres (the most famous example is Ctesiphon's proposal that Demosthenes be crowned at the Dionysia for his sage political advice). Such crowns could be awarded also to a whole state and were so frequently expected and received by rivals in the Wars of the Successors after the death of Alexander the Great that their value was often demanded in cash in lieu of the actual artefacts, a practice which by the Byzantine period had been formalized as a tax. As symbols of their position Hellenistic monarchs held a sceptre and wore purple garments and a diadem consisting of a white cloth knotted behind with free-flowing ends (this last was first assumed by Alexander, probably to advertise his conquest of Asia since Greeks had hitherto not worn diadems to indicate kingship, while Persians had).

Early Byzantine emperors naturally followed Roman tradition, since they were Latin-speaking and nobody recognized any break in the continuity of the empire despite its new orientation. Augustus' fiction of the re-establishment of the republic meant that in theory emperors were chosen simply as "first citizens" by the will of the people, which in practice ensured that after they had taken power peacefully or by violence they were begged to assume that same power by a compliant senate. Frequently they were first acclaimed *imperator* by their soldiers, a practice that evolved from this title being temporarily bestowed upon triumphing generals by their troops. Acclamations of welcome are first documented at Trajan's accession in AD 98 and thereafter were an increasingly ritualized part of these (and numerous other) imperial occasions. An important act at accession became the distribution of largesse to soldiery and populace. The diadem, famously refused by Julius Caesar in 44 BC, was not worn by the early emperors, but in radiate form it had become the chief imperial numismatic *insigne* by the 3rd century AD.

Cos

Island in the Dodecanese

The island of Cos is the largest of the Dodecanese after Rhodes (although only about one-fifth of its area), and lies close to the coast of Asia Minor; its long, narrow shape, with an area of 282 sq km, extends, at its northeastern end, into the gulf separating the headlands of Halicarnassus (now Bodrum) and Cnidus. It has been known by several names, from the Cos Meropis of Strabo and the Caris of Stephanos of Byzantium to the medieval Lango (referring to its long shape) and the Turkish İstanköy.

The island has two prominent mountain formations, with the two highest points being Oros Dikaïos towards the northeast (846 m) and Oros Latra in the southwest (428 m). Most of the rest of the island is quite fertile, with a light, sandy soil, and has always produced much fruit, vegetables, and wine, while its silk was famous in antiquity for its fine texture.

Although populated since earliest times, and later colonized by both Carians from Halicarnassus and by Dorians, the island did not play a part of great importance in Greek history until the mid-4th century BC, with the foundation of the city of Cos. Thereafter it rapidly became one of the main maritime and trading centres of the Aegean, and was

later to be the second city of the province of the Islands.

The artist who was perhaps the most famous painter of the ancient world, Apelles, was a native of Cos, and although his renown meant that he worked in many other parts of Greece, Pliny (*Naturalis Historia*, 35. 80) in his account of his life said that he was working at Cos on a painting of *Aphrodite Anadyomene* when “death grew envious of him” and he died with the work unfinished. Also on Cos was a marble statue of *Aphrodite* by the equally famous 4th-century BC sculptor Praxiteles; he had carved two versions, one clothed and one naked, and offered them both for sale at Cnidus; Pliny (*Naturalis Historia*, 36. 20) relates how the people of Cos chose the clothed one, “thinking that this was the sober and proper choice to make”.

It was to be the association of the island with Hippocrates, the father of the medical tradition who was born there c.460 BC, that lay behind the foundation of the Asclepieum; this was to bring worldwide fame to Cos as a centre of healing. The “Hippocratic oath”, named after him, still forms the basis of contemporary medical ethics throughout most of the world, and must be seen as one of the main gifts of the Hellenic world to international medical culture; in revised form it is still actively applied. The Asclepieum was founded after the death of Hippocrates in the mid-4th century BC, and its priests, the Asclepiadai, became known for performing medical cures that followed the teaching of Hippocrates. It developed and prospered over several centuries, eventually reaching the hugely impressive monumental complex that has now been excavated, before major destruction in the 6th century AD. Today it is the island’s most visited site.

It may have been the fame of the island in late antiquity that accounts for its importance in early Church history. It was to be one of the three Aegean islands that were represented by bishops at the First Church Council at Nicaea of AD 325 (the other two were Rhodes and Lemnos), and the bishop of Cos, as a suffragan of Rhodes, was present at all major subsequent councils. Several important early Christian basilicas were built on Cos, and those excavated at Hagios Stephanos, Zipari, Mastichari, and in the town of Cos itself all have impressive floor mosaics.

Cosmology

One of the most significant contributions of Greek civilization to the world is the speculative study of the universe. In the 6th century BC the earliest Greek philosophers made the momentous step of viewing the world as a product, not of divine beings exercising supernatural powers, but of natural substances exhibiting natural powers. Why precisely the Greeks of the 6th century made this step is not clear, but modern science can be identified as the legacy of that tradition.

The mythographers of the 8th century BC, Homer and Hesiod, accepted from tradition a world in which a flat circular earth, bounded at its edge by the ocean, lay between a firmament of heaven (Ouranos) above and gloomy underworld (Tartaros) beneath. According to Hesiod, the world arose when Chaos (a yawning gap) was born, followed by the birth of Earth, Heaven, and other cosmic deities. Rejecting such supernatural explanations as this, the philosophers of Miletus gave naturalistic accounts of the world and how it arose. Little is known about the theories of the first philosopher, Thales, except that he is said to have derived all things from water and conceived of earth floating like a raft on a vast sea. His successor, Anaximander, theorized that the earth was a disk with its diameter three times its height, surrounded by circles of fire veiled in mist. The fire shone through holes like spoke-holes on a wheel, appearing as the sun, the moon, and the stars. The world came to be when something productive of hot and cold separated off from the “boundless” matter of the universe. Anaximander’s successor, Anaximenes, pictured a flat earth that rode on a cushion of air. The heavens rotated around the earth like a felt cap, surrounded by a boundless expanse of air.

Challenged by criticisms of Parmenides and his followers that what-is cannot arise out of what-is-not, natural philosophers of the 5th century BC emphasized the construction of the world from pre-existent elements. Empedocles envisaged a universe in which a world like ours cyclically alternates with a perfectly homogeneous sphere in which all of the four elements (earth, water, air, fire) have become completely mixed. Anaxagoras posited a world which arose out of an original chaos when a vortex motion separated the elements into distinct layers. The atomists posited an infinite void in which indivisible particles of matter, the atoms, combined and separated to create multiple worlds and their contents. The early philosophers had learned to distinguish between a world-order or world (*kosmos*), of which there might be many, and the universe (*to pan*) which contained one or more ordered worlds and all unordered matter.

The break from mythological thinking was not complete or sudden. The philosophers of Miletus tended to endow the original stuff of the

universe – water, “the boundless”, or air – with divine qualities and to view it as an autonomous agent. Empedocles and Anaxagoras posited personified forces alongside their elements: Love and Strife (i.e. attraction and repulsion) for Empedocles, a cosmic Mind for Anaxagoras. The atomists finally did away with personified agents altogether, accounting for all changes merely on the basis of the motions of atoms. Early Greek philosophy had arrived at mechanistic explanations of the natural world.

In the 4th century BC the philosophical tradition turned strongly against such approaches to cosmology. Steeped in Socrates’ ethical philosophy, Plato criticized natural philosophers for describing how natural phenomena took place while ignoring the fact that the world is organized for the best. To the scientist, mechanical explanations should be preliminary to teleological explanations. In the *Timaeus* Plato sets out to produce a new kind of cosmology based on his principles. Introducing a divine craftsman, the Demiurge, Plato shows how he must have arranged the world for the best, as a copy of an eternal paradigm. The Demiurge forms the earth as a spherical body enclosed in a heavenly sphere pervaded by soul. Outside the cosmos there is nothing. The traditional gods, who are born later, design the human body as the best vehicle for the human soul. Plato explains the motion of the heavenly bodies as circular orbits carried at uniform speeds; apparently irregular motions of the planets are the result of compound motions of several circles.

Although Plato’s theory seems unscientific by modern standards, it was important in several ways. First, it allowed for a synthesis of scientific explanation and human values, which seemed to be undermined by materialistic theories of the early philosophers, and hence prepared the way for an acceptance of scientific explanation by popular opinion. Second, it made teleological explanations central to science, allowing for a flourishing of biological sciences. Third, his account allowed for the possibility of developing mathematical models of the heavens, which would lead to a flourishing of astronomy. Fourth, his theory that the earth is spherical was correct, and would henceforth become the standard view on the shape of the earth.

Plato’s student Aristotle devoted much effort to working out the details of a cosmos inspired by Plato. Rejecting the hypothesis of a divine craftsman, Aristotle argued that the world was not created, nor would it be destroyed. Rather it exists forever, repeating its meteorological cycles. The four elements are arranged concentrically, with a spherical earth at the centre, surrounded by a shell of water (the seas), a shell of air (the atmosphere), and a shell of fiery matter. Earth and water naturally travel towards the centre of the universe (located at the centre of the earth), air and fire outwards to the

periphery. From the region of the moon outwards the heavens consist of a fifth element that some identify with ether, which naturally moves in a circle, but which participates in no other kinds of change. Hence the heavenly bodies are all changeless except for their daily and yearly motions, while all things below the moon are subject to change along with the four elements of which they are composed, which elements are transformed into one another in daily and annual cycles. The heavens are further composed of concentric spheres and the heavenly bodies that move with them. These bodies move in imitation of a first unmoved mover, which we may identify with God, a being that lives the best kind of life by exercising pure mental activity. In Aristotle's world, as in Plato's, everything is arranged for the best; for Aristotle, however, the order is not imposed from without by a craftsman but achieved by natural processes.

Aristotle provided the standard picture of the cosmos for most thinkers in Europe and the Middle East down to the early modern era. The only serious contender was the conception of Epicurus, who revived atomism with a few modifications c.300 BC. But because Epicureans apparently clung to the view that the earth was flat at a time when scientific arguments for sphericity had already been given (by Aristotle) and the circumference of the earth had actually been calculated by scientists to a fair degree of accuracy (e.g. Eratosthenes in the 3rd century BC), Epicurus' theory was in effect obsolete from the time he propounded it. Meanwhile, Plato's conception of the heavenly bodies moving in circles with uniform speed inspired increasingly accurate mathematical models of planetary motions, culminating in the use of epicycles, small circles drawn from a point moving on the orbits of planets. The use of epicycles and other devices allowed astronomers to describe the motions of planets very closely. But the mathematical models produced another problem: no physical theory (Aristotle's was still the most influential) could account for the epicyclic motions of planets. The more accurate mathematical description became, the less satisfactory physical theory proved to be.

In almost all Greek theories of the cosmos, the earth was at the centre. But there were exceptions: Philolaus in the 5th century BC had posited a central fire around which the earth and all other heavenly bodies revolved. In the 3rd century BC, Aristarchus of Samos put forward the correct view that the planets revolve about the sun. His theory, however, never caught on. In the 2nd century AD Ptolemy combined traditional cosmology with the latest methods in mathematical astronomy and fresh observations to produce the most comprehensive astronomical account of the ancient world as well as the best geography of the earth. His treatises subsequently became the standard textbooks for astronomy and geography.

By the 3rd century AD Neoplatonism was becoming dominant among intellectuals. Mixing mysticism with Platonism, Plotinus saw the ultimate reality as an ineffable One from which emanated a cosmic Mind, in which the Platonic Forms found place, from which emanated soul, from which in turn emanated matter. Emanation was not to be understood as generation in time but as a timeless causation from the higher to the lower. The world, then, did not come to be in time, but always was, conforming to the perfect Forms of Mind. Neoplatonic theory did not so much revise the concept of the cosmos as locate it within a hierarchy of beings. About the same time as Neoplatonism became influential, Christianity began to emerge as a leading religion. Church Fathers sought to ground Christian theology in the dominant philosophy of the time, Neoplatonism, but were forced to modify philosophical theories to accommodate their religious doctrines. The world was not everlasting, but created by God, in accordance with the Forms, which were now understood to be in the Mind of God. The heavenly spheres of Aristotle were now understood to be peopled by angels and the Classical cosmos was Christianized. But essentially the cosmos of the Christian Middle Ages, both in the East and West, was Aristotle's cosmos located in a Neoplatonic hierarchy of beings and populated with demons and angels as well as humans, created and ruled by a transcendent God, who could be identified in different contexts with Plato's Demiurge, Aristotle's unmoved mover, and Plotinus' One.

Crates of Mallus

Stoic philosopher and literary critic of the 2nd century BC

Mallus in Cilicia, in southeast Asia Minor, lay in an area that was an important centre of Stoic studies from the 3rd century BC until at least the 2nd century AD. Exactly when Crates, son of Timocrates, was born there is unclear; however, we learn from the *Suda* that he was a contemporary of Aristarchus of Samothrace (c.216–144 BC), from Strabo that he was also a contemporary of Demetrius of Scepsis (born c.214 BC), and from Suetonius that he was sent from Pergamum to Rome on a diplomatic mission at about the time of the death of Ennius (169 BC). All of this suggests that he moved to Pergamum at the time of Eumenes II (197–158 BC), the most culturally ambitious and the most tireless promoter of scholarship and the arts of all the Attalid dynasty. Crates had followers (we hear of "Cratetians"), but these may simply have been students in the Stoic tradition (the most distinguished was Panaetius) rather than members of a "school" deliberately established in Pergamum to oppose the scholarship produced in the Museum and Library at Alexandria.

Crates is much quoted in scholia, lexica, and collections of "opinions" generally (in Mette's two volumes (1936, 1952) there are 18 items of "testimonia" and 86 "fragments" – rather more voluminous than what is meant by this term in other collections – covering a total of 313 pages of printed text; See also Mette's indexes of sources). Of his works on literature only two titles appear reasonably certain: the first (?*Diorthotica*) seems to have been a commentary with textual criticism of the *Iliad* and *Odyssey* in nine books, while the second (*Homerica*) may have dealt with problems of geography and even cosmology. We have, however, no idea of the total range of Crates' Writings on literary topics: there may have been many other works, since we have "fragments" citing his opinions on Hesiod, on Alcman, on Euripides, and on Aratus, for example; but these may simply be obiter dicta to his works on Homer.

What seems fairly certain, however, is that Crates' approach to literary studies was primarily Stoic and this determined the type of

scholarship that he produced. Cicero tells us that Chrysippus, another native of Cilicia, the third head of the Stoa and the person who, in his voluminous Writings, gave the definitive statement of the principal Stoic doctrines, had “wanted to harmonize [*accommodare*] the myths in Orpheus, Musaeus, Hesiod, and Homer with his own views ... about the immortal gods, so that even the earliest poets, who had not the slightest idea about these views, would appear to have been Stoics” (*De Natura Deorum*, 1. 41). Given this manner of proceeding, it became possible for a literary critic of the Stoic persuasion to elucidate the “true” meaning that lay behind the words of an early poet, as Crates did for Homer most spectacularly (and bizarrely) when he interpreted the shield of Agamemnon (*Iliad*, 11. 32–40) as a representation of the cosmos and the shield’s ten circles of bronze (line 33) as standing for the ten cosmic spheres and so on, with every detail “explained” by means of allegory (Eustathios on *Iliad*, 11. 32–40 = Mette, 1936, fr. 23a; Mette also argued for the same interpretation by Crates of the shield of Achilles, famously described at *Iliad*, 18. 463–608: cf. Mette, 1936, pp. 36–42). Likewise, a person with a good understanding of Stoic doctrines (the “truth”) could see where the essential message had been corrupted, either because the poet had failed to apprehend it correctly or because errors had crept into the manuscript tradition: in either case the text could now be properly emended. This somewhat circular reasoning does not explain every emendation of Homer proposed by Crates, but it does go some way towards accounting for the remarkable freedom with which he, and other scholars, expounded the text.

Crates’ great rival among literary critics was Aristarchus of Samothrace, who became chief librarian in Alexandria around 153 BC. Their differing approaches to a problem are well exemplified in a lengthy passage in the *Geography* of Strabo (1.2. 24–28), where they are described as “the leading figures in this field of knowledge [sc. literary criticism]”; where Aristarchus is replying to an emendation of *Odyssey*, 1. 24 and a hypothesis of Crates about the Ethiopians; where Strabo dismisses the arguments of both as wrong (because, in his view, each has misunderstood what Homer is saying); and where Aristarchus, whose reading is the one found in standard texts today, is described as “also indulging in a petty and pointless discussion of the text”! Overall, one has the impression not so much of a clash of “schools” but of a personal rivalry between leading scholars, such as is still found today: they do, of course, agree on some things but disagree about much more.

Neither Crates nor Aristarchus was in any sense a narrow specialist and the passage just cited shows their interest in cosmology and geography. In Crates’ case this led to what seems to have been a major

innovation: according to Strabo (2. 5. 10), since the known, inhabited part of the world (that is, Eurasia and the northern portion of Africa) occupies but a small part of the total land mass of the globe, anyone who wishes to represent it accurately must make a large globe of the world (no less than 10 feet in diameter) “just like that of Crates”.

There is another area, the study of the formal structure of language, where Crates and Aristarchus are contrasted in our sources. In Alexandria principles of regularity in the declension of nouns had been analysed and described, and to this principle the term *analogia* had been applied; by contrast, the Stoic Chrysippus had argued that words and the things they described frequently did not stand in any sort of harmonious relationship, and this situation he called *anomalía*, writing four books on the subject. By the time of Crates this area of study was being called *grammatiké* (sc. *techné*), and Aulus Gellius tells us that “two distinguished Greek *grammatici*, Aristarchus and Crates, made a habit of defending with the utmost vigour, the former analogy, and the latter anomaly” (*Notes Atticae*, 2. 25. 4). Obviously both ideas can be observed in declensions and conjugations; moreover, it was the Stoics in Crates’ day who made the greatest contributions to the study of *grammatiké*. It should, however, also be noted that Crates preferred to call himself *kritikos* (a critic), regarding criticism as “a master-science of language, comprising grammar, linguistics, and literary criticism” (Asmis 1992, p.139).

Finally, in his work *On Grammarians* Suetonius states that in his view, it was Crates of Mallus who introduced the study of grammar to Rome: during his embassy from Pergamum he had the misfortune to fall into a sewer opening and broke his leg, so that the public lectures and seminars that he had already been giving were continued into the period of his convalescence (*De Grammaticis*, 2). It is highly unlikely that Crates could have discussed grammar without at least some mention of basic Stoic ideas; accordingly, it may not be unreasonable to see in Crates one of those Greek philosophers who presented Stoicism, possibly in a somewhat simplified form, in Rome in a manner both accessible to, and welcome among, upper-class Romans – with enormous consequences for Roman conduct in the future.

In the 20th century our knowledge of Crates’ activities and importance has been greatly enhanced by the work of H.J. Mette; some of his theories, however, especially the connection posited between the close scrutiny of anomaly and the ideas of the “empirical” school of medicine, remain controversial. More recently, K. Asmis, in an important and carefully argued paper analysing the discussion of Crates in book 5 of Philodemus’ *On Poems*, has attempted to reconstruct Crates’ theory of poetry; in addition, and more surprisingly, she concludes that he was not a Stoic philosopher, but as

a “critic” simply adopted some Stoic principles and rejected others (p.161).

CHARLES L. MURISON

Biography

Born at Mallus in southeast Asia Minor c.215 BC, Crates seems to have moved to Pergamum from where he was sent on a mission to Rome in 169 BC. As a literary scholar he worked mostly on Homer and was the rival of Aristarchus of Samothrace. Suetonius says that he introduced the study of grammar to Rome. He took his linguistic principles from Stoic philosophy. His date and place of death are unknown.

Crete

Aegean island

“Out in the dark blue sea lies a land called Crete, rich and lovely land, washed by the waves on every side, densely peopled and boasting ninety cities. Each of the several races of the isle has its own language. First there are the Achaeans; then the genuine Cretans, proud of their native stock; next the Cydonians; the Dorians with their three clans; and finally the noble Pelasgians. One of the ninety towns is a great city called Knossos, and there, for nine years, King Minos ruled, and enjoyed the friendship of almighty Zeus” (*Odyssey*, 19. 172ff., translated by E.V. Rieu). Thus Odysseus described this Aegean island which has often played an important and intriguing role in the history of the Hellenic world, especially in pie- and protohistoric times – a preeminence which may be partly reflected in the fact that Crete is the home of many famous Greek myths and legends, from the story of Zeus’ birth in one of the island’s numerous caves to Theseus’ slaying of the Minotaur, Minos’ stepson, a creature half man and half bull, the offspring of the union between the king’s unfaithful wife, Pasiphae, and a handsome bull.

Crete is the largest Aegean island. It is approximately 250 km long and its width ranges from 58 km at its widest point, across the Psiloriti massif, to 12.5 km at its narrowest, across the isthmus of Ierapetra; it lies across the southern Aegean basin, between the southeast tip of the Peloponnese and the island of Cythera (to the

west) and the Dodecanesian islands of Kasos, Karpathos, Rhodes, and the southwest coast of Turkey (to the east); the Libyan Sea separates it from the north coast of Africa (about 300 km to the south) while the Aegean Sea and the Cyclades lie to the north.

Crete is now divided into four “nomes” or prefectures grouped around the main urban centres of Herakleion, Chania (ancient Kydonia), Rethymnon, and Sitia. About 20 per cent of the present population (a little over 500,000) reside in Herakleion.

The wild, rugged, and varied landscape is largely dominated by chains of limestone mountains forming the island’s backbone. The main ranges are the White Mountains (2453 m) in the west, Psiloriti or Mount Ida (2456 m) in the centre, and Lassithi or Mount Dykte (2148 m) in the centre-east. The smaller Sitia mountains lie at the eastern end of the island, beyond the isthmus of Ierapetra, and the Asterousia Mountains are situated in the centre-south, between the Mesara plain and the Libyan Sea.

Crete’s main mountains slope more gently towards the north coast, where there are several small coastal plains, but the largest piece of flat land is the Mesara, in the centre of the island, on the south coast. A characteristic feature are the small high upland plains, of which the best known are the Lassithi plateau, Nida (on Psiloriti), and Omalos (in the White Mountains), from which starts Samaria, the longest (17 km) and most spectacular of many gorges scarring the Cretan landscape.

There are few rivers, often reduced to little more than a trickle in the summer, such as the Kairatos near Herakleion, and the Ieropotamos in the Mesara, which is believed to have been partly navigable in antiquity. There is also one small freshwater lake, Kournas, a short distance inland from the north coast between the modern towns of Rethymnon and Chania.

Crete has been renowned since antiquity for its wild plants and flowers, of which over 100 are exclusive to the island. Among the fauna it is worth mentioning the wild goat (*agrimi* or *kri-kri*), often depicted in Minoan art and still surviving in the wild.

Crete is most famous for its long-lived Bronze Age civilization, called Minoan after the mythical king Minos, but the whole of the island’s history is equally intriguing, as varied and rough as the landscape.

The earliest traces of human habitation go back to the Neolithic period (c. 7000–3500 BC). The first inhabitants were probably a small group of farmers from Anatolia, who crossed the Aegean Sea and settled at Knossos, sometime before the end of the 8th millennium BC. In the following millennia their first settlement expanded, more or less steadily, and from there groups of settlers spread to the rest of the

island.

Knossos, the first as well as the largest Neolithic settlement on Crete, maintained its pre-eminence also during the following Bronze Age (c.3500–1100 BC), which saw the emergence and demise of the Minoan civilization. What language (or languages) the Minoans spoke is unknown, for their surviving documents were written in two scripts, known as Cretan Hieroglyphic (or Pictographic) and Linear A, which, so far, have not been convincingly deciphered: all one can say is that these scripts do not represent a form of Greek. (Indeed, a non-Greek language continued to be spoken in the east of Crete as late as the 3rd century BC, as shown by surviving inscriptions found at Praesos). The Minoans, however, had a significant and lasting influence on the population of the other Aegean islands and on the Greek-speaking population of mainland Greece, the Mycenaeans, before eventually succumbing to their power.

When exactly the Mycenaeans gained political supremacy in Crete is still a matter of debate, but most scholars believe that this may have happened towards the end of the Late Minoan IB period, that is around 1450 BC (low chronology) or 1550 BC (high chronology). That at some point during the second half of the 2nd millennium BC: Mycenaean Greeks gained control in Crete is demonstrated by the Linear B tablets found by Sir Arthur Evans at Knossos at the beginning of the 20th century, Linear B, which is a development of Linear A, was deciphered as Greek by the British architect Michael Ventris in 1952.

Crete continued to flourish until the collapse of the Mycenaean palaces on mainland Greece (c.1200 BC), which heralded a period of insecurity and movements of people throughout the Aegean. In Crete this is indicated by the emergence, in the 12th century BC, of settlements on naturally defended high ground, such as Kastri, Vrokastro, and Karphi. The following period, the Early Iron Age (Geometric and Orientalizing periods, c. 1100–700 BC) witnessed the gradual infiltration of a Dorian population as well as the emergence of the polis or Greek city state. The Dorians eventually came to dominate the island, building substantial cities, such as Lato and Dreros, often at war with each other. Throughout these changes, several Minoan cult places – such as the sanctuary at Syme, and the sacred Dyktean and Idean caves – continued to function as places of worship. Some of the finds from the Idean cave, namely the famous votive bronze shields with figurative relief, together with lively local pottery production, show that the island was one of the earliest centres in the Hellenic world to adopt the new orientalizing fashion. Crete is also the likely home of the Daidalic style of sculpture which had an important influence in the artistic development of the Archaic period throughout Greece.

Cult

This article deals exclusively with pagan antiquity, because the change in the nature of belief and ritual with the coming of Christianity was

so marked that it would be misleading to treat any aspect of Christian practice as having developed out of a pagan forerunner. Within the context of ancient Greek religion, “cult” refers to the rites and ceremonies of worship.

Most of the evidence for cult activity concerns official, public, service to the gods (*latreia*, *therapeia*). Participation in communal worship was one of the responsibilities of the citizen: at his trial, Socrates attempted to defend himself against the charge of not believing in the gods of the state by pointing out that he had been sacrificing regularly at the common festivals and on public altars (Xenophon, *Apology*, 10–11; cf. Plato, *Apology*, 26c).

But already in the Classical period, not even mere presence at ceremonies could be enforced, and at Athens at least, recourse was made to the “theoric fund”, which provided the working poor with compensation for lost income so that they could attend public festivals. During the Hellenistic period it was not uncommon to declare public holidays during festivals, when businesses shut and people were adjured to take part. Schoolboys were often required to participate by marching in sacral processions.

The purpose of ritual was manifold: to avert the wrath of the deity, to obtain her or his goodwill, above all to establish a rapport between god and worshipper. The forms – more or less strictly adhered to – were based where possible on Homeric precedent. Thus the sacrifice performed by Nestor in *Odyssey*, 30. 418–63 served as a model for full-scale public sacrifices throughout antiquity, just as Odysseus’ visit to the underworld (*Odyssey*, 11. 23–50) was the model for the worship of heroes and other ground-dwelling deities. In this sense, of being mined for guidance to correct procedure, the Homeric poems were the nearest the Greeks came to having a “Bible”.

Invocations of and prayer to the deity were less important in themselves than they were to worshippers in the Judeo-Christian traditions; rather, they were integrated into the central act of public worship, that is, the donation of gifts in the form of sacrifices or votive offerings.

Animal sacrifice is the most spectacular example of this transaction. It is a procedure that the ancient Greeks had in common with peoples of the Near East (well summarized by West). Depending on the nature of the deity, the animals sacrificed were entirely consumed by fire, or were shared as food by both gods and men. Sacrifices of the first kind (*sphagia*, *enagismata*) were made to heroes and gods who were believed to reside underground. Heroes were dead humans whose mortal remains were worshipped, usually at the place of their burial. The purpose of sacrifice in these cases was to rejuvenate and/or revive the heroes so that they might come to the aid of the worshippers.

Heroes were usually bound to a restricted geographical area. The standard method of sacrifice was to lay a fire in a pit (*bothros*), slaughter the animal over it, catch the blood and pour it or other liquids into the ground at or near the “tomb”, and burn the whole carcass up. The invocation of the spirit of Agamemnon in Aeschylus’ *Choephoroi* (84–164) is a good example of the procedure, with, in this case, a liquid offering (*pelanos*) poured out at the tomb.

The status of hero was accorded to a wide variety of persons: distant ancestors, founders of colonies (oecists), figures from epic; but in many cases the names, if they ever had them, are unknown to us. Generally speaking, when a hero’s parents were known, one was divine, the other mortal (usually the mother: Achilles is a noteworthy exception). Two such – Heracles and Asclepius – became famous well beyond their original spheres, and reached the status of hero-god.

Gods, particularly those whose conventional abode was on Mount Olympus, received *thysiai*, the sacrifice of parts of animals burned on a raised altar (*bomos*). Here the model is Hesiod, who tells the “just-so” story of how the Titan Prometheus – a friend to mankind – duped all-knowing Zeus into accepting as his share of the sacrifice the fat and bones of the beast, leaving the edible meat and hide to man (*Theogony*, 538–42). In this kind of sacrifice the animal is consumed jointly by god and worshipper alike, and usually within the sanctuary itself. The valuable hides normally formed one of the perquisites of the priest.

Sacrifices often, but by no means always, took place within the context of a formal festival. There were also bloodless offerings, often occasional, such as the first fruits, and objects (ranging from items of clothing or armour to full-sized statues) symbolizing the dedicator or their achievements, offered as gifts. Some were thank-offerings for favours received (good crops, successful delivery from life’s crises, such as illness or war); others were supplicatory.

The rituals of the cult were performed by “doers of sacred acts”, *hierēis*, a term usually translated as “priests”, which is misleading to us, because these people were functionaries rather than members of a discrete caste, the only exceptions being those officiants who introduced initiates into various mysteries, and who usually belonged to a hereditary priesthood. But even they were not set apart from their fellow citizens, except in the actual performance of their duties: for example, Callias son of Hipponicus, torchbearer of the Eleusinian mysteries and one of the richest men in Athens in the 5th century BC, negotiated the peace settlement with Persia that bears his name. Even the transmitters of the god’s will at oracular sanctuaries were not priestly in our sense. Occasionally a priesthood might be restricted to a man or woman of a certain age, whose term of office might be

measured in lifetimes. Most often, however, priesthoods were annual magistracies like any other.

Cult activity normally took place in a sanctuary, an area cut off (*temenos*) from the secular world and consecrated to the deity involved (*hieron temenos*, conventionally abbreviated to *hieron*). The seclusion could be marked by a wall or a series of boundary stones. It was rare for a sanctuary to be deconsecrated (there are examples in Greek settlements in Italy). The only essential feature was a space where people could gather. Most sanctuaries had an altar for the sacrifice, and many, but not all, had a structure, the temple (*naos*, dwelling place) to house the cult image and objects dedicated to the god. The sanctuary might also include semisecular structures, such as dining rooms for the consumption of the sacrificial meals. The cult image itself represented the god as his or her proxy: the Greeks were well aware of the fact that their gods were not to be tied to any one place, and that they would favour now one, then another.

Most public cults were open to all comers. Some, however, limited their clientele depending on the nature of the ritual. The Thesmophoria, for example, were restricted to women, while some sanctuaries of Heracles barred women altogether. Mystery cults, after initial screening for ritual purity, accepted almost anybody, but the central rites themselves remained a close secret known only to initiates. It is a measure of the respect in which the ancient Hellenes held their gods that to this day we know almost nothing about these rites. This is a salutary lesson to anyone who may think that the ancient Hellenes were not serious and pious believers.

Cyclades

The Cyclades were named from their clustering in a rough circle round the ancient sacred island of Delos. In antiquity 12 to 15 islands were counted as part of the group. In the modern *nomos* (prefecture) there are a total of about 30 islands and islets, with the capital on

Syros. The name is used in Byzantine sources with a quite different significance (see below).

Throughout prehistory people were drawn through the Cyclades, to Melos, at the southwest of the group, in quest of obsidian – a dark volcanic glass that was highly valued for cutting edges for tools and weapons. In the Early Bronze Age (mid-4th to late 3rd millennium BC), the culture of the Cyclades was distinct from that of the rest of the Aegean. During the ascendancy of the Minoan and Mycenaean palaces (2nd millennium BC), the islands shared in their cultures and were probably subject to their authority. The Cyclades were presumably part of the “Thalassocracy of Minos” mentioned by Thucydides. Their main contribution to Aegean culture of the time may have been as middlemen and experienced seafarers.

During the period of movement and change which followed the decay of Mycenaean civilization (11th century BC) new settlers arrived, mainly from Ionia (the coast of Asia Minor), but also from mainland Greece. Several of the communities which they founded then and in the following centuries grew into important centres. In the Archaic and Classical periods Naxos and Paros played important parts in the development of monumental architecture and sculpture, and various islands (Mykonos, Melos, Thera) had their own distinctive styles of pottery decoration. Several islands (Naxos, Paros, Thera, etc.) were active in the colonial movement and thus in the spread of Greek culture, especially to Italy and Sicily.

In the Persian Wars they were at first overrun by the enemy. Subsequently they joined the Delian League and became subject to Athenian control. In the late-Classical and Hellenistic periods they were controlled by the Macedonians and the Ptolemies, then by Rhodes, and finally the Romans.

From the Archaic period, or possibly earlier, the important sanctuary of Apollo on Delos drew people and wealth into the Cyclades. In Hellenistic and Roman times the island also became an important commercial centre, further stimulating activity in the area.

Cynics

The epithet “Cynic” (“doglike”) was first applied to Diogenes of Sinope (?403–?321 BC), as a comment on the shamelessness with which he engaged in acts that were abhorred by other Greeks. Diogenes pursued a life of unqualified self-sufficiency, with only a barrel for warmth and a club for protection, styling himself a cosmopolitan or “citizen of the world”. Arguing that actions which are based on natural impulses can never be unnatural, he defended even cannibalism and incest, and practised sexual intercourse in public. Freedom of action and freedom of speech were his watchwords, and he believed that he had found a way to make these common to everyone, not merely to the holders of civic privilege. It is said that when Alexander the Great, admiring his fortitude, asked if he could do anything for Diogenes, the latter asked him simply to “stand out of my way, because you are blocking the sun”. Plato too was a victim of his calculated insolence, and the lost *Republic* attributed to him was evidently a riposte to Plato’s dialogue of that title. For all that, Diogenes was regarded by many ancient writers not as a pure innovator, but as a “Socrates gone mad”. The bridge between the ascetic of the 5th century and the fanatic of the 4th was Socrates’ pupil Antisthenes (fl.400 BC), who held up self-denial as the chief principle of the philosophic life. Though never called a Cynic in his lifetime, he was regarded by some later commentators as the true founder of the school.

Most notable of Diogenes’ early followers was Crates of Thebes (c.368–288 BC), who differed from other Cynics in his willingness to curtail his freedom by marriage; he and his wife Hipparchia are reported nonetheless to have shared Diogenes’ indifference to prevailing sexual customs. Crates was for a time the teacher of Zeno, who is usually regarded as the founder of the Stoics. While the Stoics could not condone the licentiousness of Diogenes and Crates, there were some, like the slave Epictetus (fl.AD 100), who represented the better kind of Cynic as an imitator of Heracles and a model of virtuous living. Epictetus is one of many moralists who adopted the homely and trenchant style of the Cynic diatribe. This form was devised to bring philosophy to the masses by Bion of Borysthenes, who taught around 315 BC in Athens, and does not seem to have adhered uniquely to any sect. In his ethics, which was the whole of his philosophy, he reduced all goods to pleasure and all knowledge to sense-perception in the manner of another Socratic school, the Cyrenaics; while he looked back to a golden age of virtuous frugality in which each man was his own governor, he did not dispute the present rights of kings. The diatribe was adapted to new purposes in the pseudo-Platonic *Clitophon*, the *Hermetica* (Treatise 7), and above all in the polished works of the orator Dio of Prusa (Dio Chrysostom, 1st century AD),

who composed fictitious speeches for Diogenes and Socrates, but reserved his most obsequious and eloquent precepts for the emperor Trajan.

Another form which the Cynics bequeathed to literature is the medley of prose and poetry known as Menippean satire, named after its originator Menippus of Gadara (3rd century BC). Its most prolific exponent was probably Oenomaus, a Hellenized Jew of Gadara (*fl.* AD 120), whose works, like those of his fellow townsman, have not survived in any quantity. Menippus, however, figures frequently in the dialogues of the 2nd-century satirist Lucian. Famous for his ridicule of philosophers, society, and the gods, Lucian repudiates the more disgusting habits of the Cynics while expressing admiration for their ideals. Nevertheless, when others praised the sacrifice of Proteus Peregrinus, who threw himself on a pyre of his own construction at the Olympic Games of AD 169, Lucian denied that he could be called a second Heracles or even a genuine Cynic; he undertook to demonstrate instead that he was a renegade from the Church.

Though Lucian need not be believed, the hypothesis that Jesus was a Cynic has been entertained by a number of recent scholars, especially those who hold that the common source of Luke and Matthew ("Q") is the most authentic record of his teaching. Evidence is found in the aphoristic sayings of Jesus (reminiscent of Diogenes and Lucian's teacher Demonax), and the poverty of his disciples, who carried only a staff and a wallet in their mission to the Galilaean cities. It must, however, be emphasized that Cynics worked no miracles, did not live in communities, did not commend humility, and (whatever they thought of kings) never promised anyone a kingdom. The manner of Jesus is evidently different from that of Paul, yet it has been maintained that the latter was indebted to the diatribe as a model for his letters. The arguments for this position, while copious and occasionally impressive, are always vitiated by the difficulty of determining what ought to count as a specimen of the form.

Popular opinion in antiquity, noting that Christians held aloof from sacrifice and occasionally from marriage, appears to have equated them with Cynics and to have suspected them of similar or worse atrocities. Perhaps it was the desire to maintain a distance that led Justin Martyr into his fatal feud with the Cynic Crescens; yet Tatian's pupil Justin has been suspected of adopting Cynic tenets when he founded a community of "encratites", who eschewed both meat and sexual intercourse. In fact, though some later Cynics may have practised vegetarianism, the dietetic axiom of Diogenes and Menippus was that nothing is forbidden; and when Cynics avoided marriage, it was only because they wished to maintain the right to promiscuity. When Christian writers speak of Peregrinus as a paradigm of fortitude,

it is not because they regard him as a Christian; and even if the dirtiness and illiteracy of Christian monks reminded pagan observers of the Cynics, their cenobitic lifestyle and the worship of God were practices which that antisocial movement could not share. It was the emperor Julian “the Apostate” who proposed the loftiest interpretation of Cynicism, arguing that the vices of Diogenes concealed a profound critique of human laws (*Orations*, 6–7). The Church itself did little to foster the sect, which disappeared in the 6th century AD. As its legacy to Greek culture it left the adjective “cosmopolitan” (adopted by the Stoics and applied to Abraham by Philo, the Jewish precursor of Christian allegory), and the works of Dio and Lucian, the latter of whom can still be read for amusement, as well as for the elegance of his style.

MARK EDWARDS

Biography

Cynics were followers of Diogenes of Sinope (?403–?321 BC) who was called *kyon* (“dog”) for his rejection of social conventions, though some regarded Antisthenes (*fl.* 400 BC) as the true founder of the school. Diogenes’ most notable successor was Crates of Thebes. The sect survived until the 6th century AD.

Cyprus

The island of Cyprus is the third largest in the Mediterranean and lies in its northeastern corner, just 70 km from the Turkish coast to the north and 103 km from Syria to the east. The nearest Greek island is Castellorizo, 270 km to the west, followed by Rhodes at 386 km to the west. Cyprus itself has a maximum length from east to west of 222 km, and a maximum width of 95 km. Geographically, it is dominated by the igneous Troodos mountain range in the centre of the island, rising to a height of 1951 m at the pineclad Mount Olympus, and by the long Kyrenia (or Pentadaktylos) range stretching along the north coast. Between them and extending to the east coast is the fertile Mesaoria plain. The west and northwest areas of the island are mountainous and often rugged; the south and east coasts depend on the rivers coming down from the Troodos mountains; the coastal plains in the north are fertile and well watered. The climate is semi-

arid, and throughout its history human settlement has been heavily influenced by the need for water.

The first contacts with the Aegean world date from the Middle Bronze Age (c.2000–1600 BC), with a series of vases imported from Crete, mostly found in tombs along the north coast. The first large-scale contacts came during the Late Bronze Age (c.1600–1050 BC). During much of this period Cyprus had a complex urban civilization based on agriculture and copper production, with extensive trade links throughout the eastern Mediterranean. Important cities such as Enkomi on the east coast and Hala Sultan Tekke and Citium on the south coast near Larnaca clearly controlled large parts of the island both economically and politically, and one or more of them seems to have been the “Alashiya” mentioned in Near Eastern texts. The Cypro-Minoan script of this period, so-called because of its apparent similarities to Linear A on Crete, was probably used for bureaucratic purposes in large administrative buildings in the main cities. Although it has not been deciphered, it is clearly not Greek.

During the 14th century BC there was a great increase in the amount of Aegean pottery coming to Cyprus, mostly from Mycenae, and by the 13th century BC Mycenaean-style pottery was being manufactured on Cyprus. Pottery alone is insufficient evidence for the arrival of a Greek-speaking population on the island, but it is abundantly clear that by the Iron Age most Cypriots were speaking a dialect of Greek. The most plausible occasion for this demographic change is in the upheavals of the 13th and 12th centuries BC, when the “Sea Peoples”, migrants and refugees from the west, were travelling, raiding, and settling across the eastern Mediterranean. The first known Greek inscription in Cyprus was found in an 11th century BC tomb in Palaipaphos in the west, a bronze spit with the name “Opheltes”. Although clearly a Greek name, and using a grammatical form characteristic of the Arcadian dialect of Greek, this is written in the Cypriot syllabary, a development of the Cypro-Minoan script adapted for the use of the Cypriot dialect of Greek.

The earlier part of the Iron Age (c.1050–475 BC) seems to have been characterized by a low population and simple social structure. In the 8th century BC the characteristic city kingdoms began to develop, with local elites maintaining their power using elaborate ceremonial and luxury goods imported from the east. During this period there is an increasing number of inscriptions in Greek, written in the Cypriot syllabic script. This culminated in the 6th century BC, when a significant number of people were literate enough to write names on tombstones or dedications at sanctuaries. At the same time there was a considerable increase in imported pottery from Greece, particularly from east Greece and Athens, and Greek styles of sculpture had a

strong influence on local Cypriot traditions, as seen in the many dedications in rural and urban sanctuaries.

From the beginning of the 5th century BC Cyprus appears regularly in the Greek written sources. We have an account in the pages of Herodotus about the participation of most Cypriot cities in the Ionian Revolt against the Persians in 499 BC, though they were retaken by the Persians in the following year. In political terms the 5th and 4th centuries BC were largely taken up with struggles against the Persians. The Athenian general Cimon led an expedition to Cyprus in 450 BC, but he died the next year, and his forces, after failing to take Salamis, returned home. A local player who acquired major influence in these power games was Evagoras I, king of Salamis from 411 to 374/73 BC, whose reign was vividly though uncritically described by his eulogist, the Athenian orator Isocrates. Resolutely pro-Athenian, he used his political and diplomatic skills to resist the Persians, increase his own power over the other city kingdoms of Cyprus, and disseminate Athenian art and culture. It was during his reign that the Greek alphabet began to displace the ancient Cypriot syllabary.

When Alexander the Great laid siege to Tyre in 332 BC, he was aided by 120 Cypriot ships, and although he never actually came to Cyprus, he made it clear that he was the island's master by issuing coins in his own name. At his death in 323 BC Cyprus, like most of his empire, was fought over by his successors, particularly Ptolemy and Antigonus. The city kingdoms aligned themselves on each side of the dispute; when Ptolemy sent an expedition there in 312 BC, the cities that had opposed him were punished and, in the case of Marion, destroyed. From this time until the Roman annexation in 58 BC, apart from one brief interlude, Cyprus was part of the Hellenistic empire of the Ptolemies of Egypt, sharing in the common Greek civilization and culture of the eastern Mediterranean.

Cyprus was annexed by the Romans in 58 BC, ostensibly because of the island's support of pirates. After being restored to Cleopatra of Egypt, it was taken by the future emperor Augustus in 31 BC, and transferred to the Senate in 22 BC. Apart from the Jewish insurrection in AD 116 and several earthquakes, this was a peaceful period in the island's history. The cities of the island boasted the usual trappings of the Roman provinces of the Hellenized east: bath houses, theatres, gymnasiums, temples, villas, honorific statues, inscriptions in Greek, and also local elites who benefited greatly from their role in the Roman administration of the province. In the countryside there was a considerable population, which supported itself through agriculture and produced wine, olive oil, flax, timber, and copper in sufficient quantities for export. Most famous of the works of art of the Roman period are the mosaics from villas in Paphos and Curium, which

depict a wide variety of scenes from Greek mythology.

Cyrenaica

Region of north Africa

Cyrenaica forms the eastern territory of modern Libya. There are two distinct areas of occupation – the uplands and the fertile coastal plain. The account of the Greek colonization of Cyrenaica is provided by Herodotus (4. 150–59). The Delphic oracle directed Grinnos, the king of the island of Thera (modern Santorini), to go and found a city in Libya. This advice was ignored, and after a seven-year drought on the island, the oracle reminded the islanders that they should send a colony to Libya. The Therans sent to Crete for advice about Libya, and as a result they came to the island of Platea (the site of which is disputed) and left a Cretan fisherman there while they returned to Thera. The Therans then sent out a group of colonists selected by lot under the leadership of Battos, and a settlement was established on the island. After further intervention from the oracle, a mainland settlement was established opposite the island of Aziris in eastern Cyrenaica. The site itself has been plausibly identified by the presence of Protocorinthian, East Greek, Cretan, and Greek pottery at the mouth of the Wadi el-Chalig. Eventually a settlement was established at Cyrene, and the numbers of Greek settlers in Cyrenaica were supplemented after a further oracle from Delphi.

Details about the establishment of Cyrene are recorded on a 4th-century BC inscription which gave the people of Thera honorary citizenship in recognition of the earlier links with the city. A section within the decree purports to be a record of the original decision of the Therans. There were apparently conditions about staying in Libya for five years before being allowed to return to Thera if the colony did

not succeed.

After the foundation of the Greek colonies during the 7th century BC, Cyrenaica came into increasing contact with its eastern neighbour Egypt. The Egyptian pharaoh Apries marched against Cyrene in 570, but this attack was foiled and led to the fall of Apries and his succession by Amasis as pharaoh. Amasis, who according to Herodotus established the Greek trading establishment of Naucratis in the Nile delta, fostered links with the Greek world, and in order to establish a link with Cyrene, married Ladice, a member of one of Cyrene's leading families. In 525 Egypt was annexed by Persia, and Cyrenaica soon became part of its larger empire following a Persian invasion which reached as far as Euesperides. Cyrene regained some independence during the 5th century BC.

Cyrenaica supported Alexander the Great and subsequently became part of the Ptolemaic kingdom. This period is reflected in the way that some Cyrenaican cities were renamed in honour of the Ptolemies: Euesperides became Berenice, Taucheira became Arsinoë, and Barca became Ptolemais. Evidence from Apollonia shows that the walls of Apollonia were constructed in the late 2nd to early 1st century BC according to an Egyptian unit of measurement. Cyrenaica was finally bequeathed to Rome on the death of Ptolemy Apion in 96 BC.

As part of the Roman world, Cyrenaica was initially a joint province linked with Crete. The status of the Greek community is reflected in the edicts of Augustus, dating to 7/6 BC and 4 BC, which demonstrate the perceived tension between Greeks and Romans in the province. It is not clear how far the Greek constitutions of the Cyrenaican cities continued into the Roman period. One decree from Tocra, dating to the 1st century BC, seems to suggest that the citizen body had diminished, though a number of villages across Cyrenaica probably retained their Greek identity into the imperial period. Through the 1st century it is clear from a number of inscriptions that Jews were being allowed to take part in Cyrenaican civic life. The rivalry between the two parts of the population led to a revolt in Cyrenaica and Egypt under the Roman emperor Trajan when, as Eusebius (*Ecclesiastical History*, 4. 2) described it, the Jewish population "broke into factious strife against their fellow Greek citizens".

Cyrenaica's identification in the Greek world was re-emphasized by the inclusion of Cyrene in the Panhellenion established in Athens by the emperor Hadrian; indeed one citizen of Cyrene served as an official of the Panhellenion in 157. Hadrian's patronage of Cyrenaican cities in the aftermath of the destruction of the Jewish revolt placed an emphasis on Cyrene's origins in the Greek world and the colonists from Thera.

Cyrene had a number of major sanctuaries including temples of

Apollo and of Zeus Ammon, the latter a cult linked to the famous Egyptian oracle in the Western Desert. Both seem to have been constructed in the 6th century BC. Outside the city was a major sanctuary of Demeter. Analysis of the bones from the sanctuary shows that pigs were a favoured sacrifice, as might be expected in a sanctuary of Demeter. Archaic sculpture from the city included *kouroi* and *korai* of a type found elsewhere in the Greek world. Cyrene itself issued silver coinage, probably from the late 6th century BC onwards.

Barce, on the west side of the Cyrenaican upland, was next to be established, apparently during the reign of Arcesilas II, perhaps in the 560s. This was followed by expansion in the coastal areas, with the creation of Apollonia (later renamed Ptolemais as the harbour for Cyrene, and the city of Euesperides (later replaced by the Hellenistic city of Berenice, and now the modern Benghazi) in the west. Excavations at Euesperides have revealed a carefully planned city; the earliest grid and settlement can probably be dated to at least the middle of the 6th century BC, though some deep excavations on the Sidi Abeid indicate an earlier settlement is likely. A further settlement was located on the coast at Taucheira where part of the sanctuary of Demeter and Kore has been excavated. Both Apollonia and Taucheira are recorded as being foundations of Cyrene, though Herodotus (4. 171) records that the latter was a polis of Barce.

Cyrenaica was well known for its agricultural produce. For example, probably during the 320s BC, Cyrene sent grain to some 41 Greek cities in response to a severe food shortage; Athens alone received the equivalent of 6000 tonnes, and the total gift was around 50,000 tonnes. Cyrene's prominence in the second half of the 4th century BC is perhaps also reflected in the construction of a Doric treasury at Delphi, probably in the 330s. Cyrenaica was also the source for silphium which was used for medicinal purposes among other things. The plant was used as an emblem on the coins issued by Cyrene. Members of the Cyrenaica elite enjoyed the benefits of horse rearing; a number of Pindar's odes (Pythian 4, 5, and 9) celebrate victories by Arcesilas IV and Telesicrates in the Pythian Games.

Cyrene

Cyrene in north Africa

Cyrene was the most important of the Greek colonies founded in north Africa during the 7th century BC and later. The region (to which Cyrene gave its name, Cyrenaica) was reasonably well watered and therefore fertile, but had the Sahara to the south, and was separated from Egypt by the Western Desert, with further difficult country to the west isolating it from Tripolitania (which in antiquity was a region of Phoenician and Carthaginian settlement). Cyrenaica was thus in effect a self-contained region, eventually divided among a number of Greek foundations. Contacts with the Aegean world preceded the period of colonization, and must already have existed in the Bronze Age. The Minoan harbour town of Kommos, on the south coast of Crete, with its great built shipsheds would have served for maritime links with the coastal regions of Africa immediately to the south. Even in the 1st millennium BC the coastal waters of Cyrenaica were visited by Greeks (the area produces excellent sponges) before Greek settlement took place.

Cyrene is important in the history of Greek colonization not only for the detailed account of the circumstances of its foundation in Herodotus (4. 145–50) but also for the inscription, found in Cyrene

itself, which gives the text (perhaps a later edited version) of an oath supposedly sworn by the founders. The colony was sent out, around 630 BC, by the Aegean island of Tiera (modern Santorini) after consultation of the oracle at Delphi. The reason was overpopulation, and the Therans had to order the colonists to stay for at least five years after the first attempt at settlement in Africa proved unsuccessful. They eventually settled on a small offshore island, then on the mainland, eventually moving inland to the site of Cyrene itself. Most Greek colonial foundations in overseas, non-Greek districts remained adjacent to the coast and safety. Cyrene was unusual in being situated well inland, 25 km away from the sea, on the edge of the inland plateau that stretches southwards to the Sahara. It is not clear how this was achieved in the presence of an indigenous population; either they were too few to resist, or, for some reason, they welcomed the Greek settlers. The latter is more likely, since the settlers themselves would not have been that numerous, and a non-Greek stratum persisted in Cyrene throughout its history.

The settlement was led by a man called Battos. He and his descendants ruled Cyrene as kings until their overthrow in the 5th century BC. The city prospered considerably. It produced corn on a large scale (at one critical moment in the late 4th century BC, when there was a failure of the harvest in mainland Greece and Egypt withheld supplies of corn in order to boost the price, Cyrene was able to provide an alternative source of supply, an act recorded with gratitude in Greece itself). Equally important was the product of a plant called silphium, which seems to have been a form of drug much prized in Greece, and which was so important to Cyrene that it is represented on its coins. There is an important Greek vase, a cup made in Laconia, which depicts King Arcesilas II of Cyrene supervising the loading of bales (of silphium? or more prosaically wool, another export) into the hold of a ship. The choice of subject suggests that Sparta had close contacts and hence, a very real knowledge of Cyrene. Indeed, so much Laconian pottery has been found in Cyrenaica that it was originally thought to be of local origin.

Cyrene grew up round an abundant spring of the nymph Cyrana, who gave her name to the city. Below the spring was the central sanctuary of Apollo which, though later rebuilt, contained an important example of an early Doric temple. The main part of the town lay above and to the south of the temple. A road led up to the agora, which included the tomb of the founder Battos (though the actual structure of the tomb is 4th-century BC in date). Beyond this was the greatest of the city's temples, an early 5th-century dedication to Zeus. The city itself, like most colonial foundations, was laid out to a grid plan.

Cyrene remained largely aloof from the mainstream history of Greece: its retention of a monarchy until well into the 5th century is in some respects an indication of this. With the conquest of Egypt by the Persian king Cambyses, Cyrene became attached (loosely, again because of its geographical position) to the Persian empire. Similarly, after Alexander the Great had added Egypt to the area of his rule, the Cyrenaicans deemed it prudent to make their submission to him. With the break-up of Alexander's empire Cyrene was once more independent, but eventually became part of the kingdom of the Ptolemies based on Egypt and Alexandria. Ptolemy III married a Cyrenaican, Berenice, as his queen, and other prominent Cyrenaicans (such as the poet Callimachus) were attracted to the court at Alexandria. With the decline of the Ptolemies, Cyrene became a separate kingdom, ruled by a branch of the Ptolemaic royal family. The last of these, Ptolemy Apion, bequeathed his kingdom to the Romans on his death in 96 BC.

Under the Ptolemies a substantial Jewish population established itself at Cyrene, as at Alexandria. In the 2nd century AD the Jews of Cyrene joined in the widespread Jewish rebellion against the Romans, and Cyrene was badly damaged in the resulting turmoil. Subsequently the city revived, but the temple of Zeus, though reroofed, did not have its fallen colonnade re-erected. Cyrene continued to flourish in the late empire. There are (as in the other Cyrenaican cities) important early Christian churches there, but the main centre seems to have shifted to the harbour town of Apollonia. Cyrene itself gradually withered, and with the Arab conquest ceased to be a place of any significance.

Paradoxically, this withering away resulted in a remarkable degree of preservation of its ancient remains. With the Italian occupation of Cyrenaica much excavation was carried out and was continued after the war by the Libyans under their Director of Antiquities, Richard Goodchild. Much was restored. The great gymnasium, turned by the Romans into a Caesareum, which had fallen in an earthquake, was re-erected. But the most poignant survival (now less well preserved) was the surrounding environment with its ancient roads, lined with monumental cemeteries and running out into the hinterland through a field system which still retained its ancient boundaries.

D

Dance

From the evidence of both literature and art, it is clear that in ancient Greece dancing – the art traditionally dedicated to Terpsichore, one of the Muses – was widespread and important, whether as part of private entertainment or public ceremonial. Attendance at dancing classes in the tribal divisions of society was an obligatory part of the education of young Athenians. Spontaneous or formalized dancing in groups, usually of the same sex (since many ritual occasions demanded segregation of the sexes), and solo dancing of an expressive or imitative nature, with attention to movements of the hands (*cheironamia*), are both well attested; but, surprisingly to us, dancing together in pairs of opposite sexes, as in western ballroom dancing, seems to have been quite unusual.

In the description of the scenes on the shield of Achilles in *Iliad* 18, however, youths and maidens dance in adjoining lines, accompanied by two tumbling acrobats, and the dance floor is compared to the one made by Daedalus for Ariadne at Knossos. Crete was in fact thought to have made the major contribution to the development of dance, going back to the very birth of Zeus, when the leaping, foot-stamping, and weapon-clashing of the Curetes, fertility demons, concealed the child from the cannibalistic intention of his father Cronus. A late fragmentary hymn describing the occasion, with the theme of leaping to promote fertility, was found in excavations at Palaikastro. The lively dance called *hyporchema* was also believed to have been a Cretan invention, and was occasionally introduced into the choreography of Classical Attic tragedy. Plutarch (*Theseus*, 21) also describes a dance called *geranos* (“crane”), said to have been danced by Theseus and other youths on their escape from the labyrinth of Minos, and the agility in battle of a minor warrior of the *Iliad*, the Cretan Meriones, was attributed to his dancing skill.

The association of dancing with warfare – called “fierce Ares’ dance” in *Iliad*, 7. 241 – and the manipulation of weapons are highlighted in the so-called Pyrrhic dance, also said to have derived from a divine birth, this time not of Zeus, but from his head, when Pallas Athena leapt out vigorously, fully armed. The motif of the dramatic emergence of a warrior continued to be a feature of the Pyrrhic, which was performed particularly at the Panathenaic festival by youths, naked but armed with helmet, shield, and spear, like the goddess. Socrates (Athenaeus, 628f.) is said to have declared that

“those best at dancing are also best at war”, and Plato (*Laws*, 815) described how this dance imitated defensive and offensive postures of combat. The Pyrrhic was alternatively attributed to Achilles’ son Neoptolemus (also called Pyrrhus), whose desperate self-defence against Delphians is likened to the dance in a memorable passage of Euripides’ *Andromache* (1129ff.). Aristophanes (*Clouds*, 988–89) complained that the effete younger generation in Athens could not adequately perform the shield-twisting movement in honour of Athena, and it seems that a sophisticated stereotype in the dance might replace the actual shield, with a folded cloak covering the left arm to mimic the true armed pose. The Pyrrhic is the dance most often represented in art, both in sculpture and in vase painting. A pose showing sideways or backward turning of the head is another motif, sometimes associated with another exploit of Athena, when she instructed Perseus how to avoid the fatal glare of the Gorgon in their famous combat, or even herself performed the slaying of the monster. Armed dancers were popular elsewhere in Greece, especially Sparta with its prominent tradition of military training, and an elaborate account by Xenophon (*Anabasis*, 6) gives a detailed description of these in entertainments provided by different Greek mercenaries during Cyrus’ famous march through Asia Minor. Included are a Persian dance featuring crouching and jumping, and one named *karpaia*, in which a farmer takes arms to protect his property against rustlers. The Pyrrhic is here danced as a solo by a young girl.

In *Laws* 815 Plato declares that there are two desirable types of dance, the warlike (as described above) and the peaceful, among which the stately and graceful *emmeleia* is singled out. *Iliad* 16. 183 refers to maidens dancing in the choir of Artemis, and a feature of Attic ritual was the chorus of young girls dressed as bears dancing in her honour in the township of Brauron. Dances imitative of animals and birds were widespread throughout Greece. When Odysseus is entertained at the Phaeacian court (*Odyssey*, 8. 256) he watches a pair of local youths dance, where jumping and throwing balls to each other are featured. The maiden songs (*partheneia*) with choral dancing of Alcman were notable, often celebrated at a night festival (*pannychis*). *Paeans*, mostly associated with Apollo, were composed by poets like Pindar, along with processional songs (*prosodia*), marriage songs (hymeneals, epithalamia), dirges (*threnoi*), and the victory odes (*epinicia*) for which he is most famous. Ecstatic dancing was a feature of the cult of Dionysus and his crazed maenads (most memorably featured in Euripides’ *Bacchae*). Other deities of oriental origin, such as Cybele, Attis, Sabazius, and their acolytes the Corybants, were also worshipped with the sort of dancing to musical accompaniment performed by ecstatic votaries which aroused apprehension about the

disruption of civic order in some communities.

The dance particularly honouring Dionysus was the dithyramb. Whether Aristotle was right to see Attic tragedy (certainly associated with that god, and performed in his theatre) as developing from the dithyramb remains controversial, and the latter continued to be danced independently in a circular group of 50 in inter-tribal competitions, while the tragic chorus was danced in more formal rectangular patterns of 12 or 15 performers. Having entered by the *parodos*, they performed in the dancing place (orchestra) and remained on stage during the acted portions which were punctuated by their stationary songs (*stasima*), before marching out, usually to an anapaestic rhythm, in the *exodos*. Sophocles was himself said to have been an elegant dancer, and to have written a handbook *On the Chorus*. The group of three tragedies (trilogy) was followed by a satyr play, where the chorus, sometimes in the guise of attendants of Pan or Silenus, indulged in grotesque parodies of the statelier tragic dances, and we hear too of frankly indecent dances like the *sikinnis* and *kordax*. The chorus in Aristophanes' comedies performed the energetic dances appropriate to revelry (*komos*). Dancing was a popular feature of symposia in Athens and elsewhere, and Xenophon's *Symposium* in particular describes a typical party. Courtesans (*hetaerae*) were frequently called upon for these entertainments, with the music of the double *aulos* and castanets.

When Greek culture began to penetrate southern Italy, the so-called *phlyakes* plays, of similar hilarious type, became popular, and the dances that accompanied them are represented on vases. It was in the Roman era that the craze for virtuoso dancing by Greek *pantomimi*, interpreting different mythical roles, not only spread in theatrical performance, but attracted the favour of the imperial courts. Nero's own patronage of dancing, and his taking the stage himself, were notorious. Moralists and satirists such as Cicero, Seneca, and Juvenal may have expressed their disgust at the lewdness of much professional dancing, and in the Christian era the suppression of such exhibitions was sought. Nevertheless in the 6th century the notorious dancer Theodora became Roman empress through her marriage to Justinian.

In the pantomime the same dancer acted out a series of roles, representing either sex, and changing masks accordingly, with the mimicry of a dumbshow in steps, postures, and gestures. Although in the Byzantine period stage performance declined, pagan festivals and carnivals such as the Kalends and Brumalia survived and continued to be celebrated, while more decorous dances were performed at weddings and court ceremonials. In spite of theatrical censorship, low-class dances were still to be seen in taverns, accompanied by wind instruments and percussion.

Dark Age 1200–700 _{BC}

The term "Dark Age" is a relatively recent coinage of modern scholarship, applied to the period that intervenes between the collapse of the Mycenaean palaces around 1200 _{BC} and the emergence of a new state form (the polis) in the course of the 8th century _{BC}. Ancient writers seem to have been unaware of any major disjuncture between the heroic age and the historical period. Hesiod, writing around 700 _{BC}, paints a gloomy picture of a gradual decline, symbolized by the successive "five ages" of gold, silver, bronze, heroes, and iron (*Works*

and Days, 109–76). Conversely, Thucydides' conception of early Greek history (1. 1–18) is predicated on the notion of a steady evolutionary growth of resources and power; although the period immediately following the Trojan War is characterized by instability and migration (1. 12), there is no real sense of a cultural or economic “trough” that stands in stark contrast to conditions before the Trojan expedition, nor again of a “renaissance” associated with the rise of the polis – in fact, most Greeks believed that poleis had existed from time immemorial.

Up to the 1870s, most scholars accepted – at least in principle – Thucydides' general schema of early Greek history, though many (George Grote in particular) believed that the lack of contemporary written evidence made it impossible to construct a properly historical narrative of Greece before 776 BC (the traditional date for the foundation of the Olympic Games). However, Heinrich Schliemann's excavations at Troy (1870–90), Mycenae (1876), and Tiryns (1884) made it clear for the first time that an earlier, civilized culture had flourished on the Greek mainland; it also soon became evident that the palaces associated with this “Mycenaean” civilization had experienced an abrupt end. Following Flinders Petrie's publication in 1890 of Mycenaean pottery in Egyptian contexts of the 18th and 19th Dynasties and his conclusion that the Mycenaean palaces had been destroyed around 1200 BC, it became evident that there was a gap of approximately five centuries between the collapse of the palaces and the first extant literature as represented by Hesiod and the lyric poets of the 7th century BC. The sheer paucity of evidence for this intervening period had already by the last decade of the 19th century led historians to term it a “Dark Age” or “the medieval epoch of Greece”.

It is sometimes stated today that the Dark Age is simply a “subjective” perception in the mind of the modern historian, generated by the lack of any contemporary literary evidence, and that archaeological investigation is revealing the period to be anything but obscure in “objective” terms. In fact, if anything, the opposite is more correct. It is certainly true that direct and contemporary literary evidence is lacking for the period. The Linear B tablets, which offer precious testimony for economic, social, and military conditions in the Late Bronze Age, disappear with the destruction of the Mycenaean palaces as the bureaucratic necessity for scribal literacy evaporated; literacy – this time in alphabetic form – is not attested again in Greece proper until the middle of the 8th century BC (though a possible example of the Greek script of the early 8th century BC is claimed at Osteria dell'Osa to the east of Rome). Nor has Moses Finley's argument that the Homeric epics reflect the social conditions of the 10th and 9th centuries BC met with much scholarly consensus.

Nevertheless, while recent decades of archaeological exploration have certainly served to illuminate our knowledge of the Dark Age and to trace certain low-level continuities throughout these centuries that should urge caution against too rigid a periodization, it is still the case that our increased understanding of this period ultimately confirms that settlement patterns, interactions between communities, religious behaviour, and artistic and technological traditions were indeed somewhat different from the situations that had existed earlier and were to exist subsequently.

The collapse of the Mycenaean palaces seems to have instigated certain population movements, revealed by the occupation of new areas such as eastern Attica, Lefkandi on Euboea, Emborio on Chios, Ialysus on Rhodes, Cyprus, and the north Aegean. Yet many of these sites were short-lived and by the first half of the 11th century BC the number of known settlements in Greece is less than half the 220 sites attested for the period 1200–1150 BC. This may indicate overall demographic decline but there is also the possibility that new sites were occupied on a more temporary or seasonal basis (thus potentially escaping archaeological retrieval) and it is often suggested that instability and insecurity were both the cause and effect of a shift from sedentary agricultural practices to a more pastoral lifestyle. From the 10th century BC the number of known sites begins to rise again but it is not until the 8th century BC that a sharp increase in site numbers and evident signs of urban nucleation signal a return to more settled conditions – a phenomenon that may have been triggered by, but would certainly help to foster, demographic growth.

The communities of this period were also far more isolated than had been the case earlier when the Mycenaean cultural koine had embraced much of the Mediterranean and the Near East littoral; one apparent indication of this new isolation is the increasing regionalization of pottery styles. Nevertheless, not all contacts were severed entirely: imported grave goods are still attested – albeit in smaller quantity – at sites in both central and southern Greece, while the diffusion of iron metallurgy should suggest some continued contact with the east – almost certainly with Cyprus as an intermediary. Crete in particular maintained links with Cyprus and possibly even Italy and Sicily. One of the most important “type-sites” for the period is Lefkandi on the island of Euboea where, from the 1960s onwards, excavations have brought to light part of the settlement (whose ancient name is unknown) and its cemeteries. The mid-11th-century BC tombs at Lefkandi contained artefacts from Cyprus and the Levant, though there followed a period of apparent isolation until the middle of the 8th century BC, when an imposing peripteral building, constructed from timber and mudbrick and erected over a

“princely” burial, testifies to the emergence of a hierarchy within this newly prosperous (but still fairly small) community. Immediately afterwards the building was surrounded by a number of elite burials whose grave goods indicate renewed contacts with Athens, Thessaly, Macedonia, Cyprus, and the Near East. It is fair to say, however, that Lefkandi is very much the exception to the rule: at other Greek sites it is generally not until the 9th and 8th centuries BC that more distant links are resumed as a prelude to the colonization of the west.

While the appearance of many recognizably Greek divinities in the Linear B tablets points to some continuity in religious traditions, archaeological evidence that might suggest a continuity in ritual behaviour is more elusive. A few sites certainly attest a continuity of cultic enactment from the late Mycenaean period throughout the Dark Age (Kalapodi in Phocis, Kato Syme Viannou on Crete, and possibly the Polis Cave on Ithaca), and several sanctuaries were already functioning by the 10th century BC (Munychia, Brauron, and Mount Hymettus in Attica; Olympia and Kombothekra in Elis; Amyclae in Laconia; the Heraion on Samos; Tegea in Arcadia; and Isthmia in Corinthia), but there is little or no evidence for cultic activity much before the 8th century BC at some of the more famous sanctuaries of the historical period, such as Eleusis, Delos, and Delphi, and this is also the period that witnesses the earliest cultic buildings, even in sanctuaries that had been functioning for several centuries.

Finally, the period witnesses the disappearance of certain technological and artistic traditions such as ivory working, figured pictorial representations on pottery, and monumental stone architecture. It is the apparently seamless resumption of these techniques from the 9th and 8th centuries BC onwards that has suggested to some scholars that the Dark Age is nothing other than a scholarly mirage, produced as a result of synchronizing the Mycenaean ceramic sequence with faulty Egyptian dates; it has been argued that a recalibration of the Egyptian sequence yields a destruction date for the Mycenaean palaces of 950 BC rather than 1200 BC, thus halving the five-century “gap” that troubled earlier scholars. The thesis has little to recommend it, though it provides a salutary reminder as to the fragility of pottery chronology in the ancient Mediterranean and Near East.

Dead, Cult of the

Although Homer represents the dead in Hades as devoid of physical and mental power, and Hesiod credits the disembodied spirits of the golden race with being altruistically beneficent, the common Greek belief was that the behaviour of the dead was influenced by the conduct of the living. They behave beneficently when propitiated, but maleficently when neglected or spurned. Being capable of doing good or evil, they had to be gratified with pious attentions in order to induce them to do good. Accordingly, a ritually correct burial or cremation, costly-grave gifts, and periodical offerings of food and drink were vital elements in the tendance of the dead.

The history of the Greek cult of the dead is to some extent related to the prevalence of the two chief modes of disposal, namely cremation and inhumation, although they do not reflect different eschatological beliefs. Whatever the method of disposal, it was essential to cover the body with earth, and three handfuls were sufficient to fulfil the requirements for a ceremonial burial. Thus in Sophocles' *Antigone* (255–56) the heroine scatters a thin coating of dust over Polynices. This covering cut the dead off from the sight of the heavenly gods, to prevent them from being offended and their altars polluted (cf. Sophocles, *Ajax*, 589, *Antigone*, 1716f.). It was also an act of kindness to the departed, because they could not enter the underworld unless their mortal remains were buried (Homer, *Iliad*, 23. 71ff.). To grant burial to a dead person, be he friend or enemy, was therefore universally recognized as a pious act. However, burial was denied to executed criminals, traitors, and occasionally to suicides.

When the body had been bathed, it was dressed in clothes such as the deceased might have worn in life, and laid on a couch (*prothesis*). Laments were made by the relatives and others present, and moderation in this respect (as well as in the elaborateness of funeral

pyres and the amount of grave goods buried or burned with the body) was recommended, and sometimes required by law. Finally, the body was carried to the place of burial or cremation accompanied by a crowd of mourners (*ekphora*). Only the *prothesis* and *ekphora* are depicted on geometric vases, but the Athenian white-ground lekythoi frequently depict tomb cults. In the case of cremation, the ashes were placed in a vessel whose shape, size, and material varied according to place, time, and circumstances. Coffins were normally used for burials, while elaborately carved sarcophagi became fashionable among the well-to-do in later times. It was customary to hold a funeral even in the absence of a body, and dummies may have been used occasionally. Family rituals for the dead were held at the tomb not only after the burial, but also at intervals thereafter.

Although Minoan and Mycenaean tombs show variations in size, elaboration, and the number and value of their grave offerings, we know little or nothing of their funerals. Homer describes elaborate funeral ceremonies, such as those in honour of Patroclus in *Iliad* 23. The funeral was followed by elaborate games in which every contestant received a prize of some sort. Some of these were the property of the dead person, and it has been suggested that the prizes may represent a compromise between burning all the dead man's goods with him and allowing them to be inherited. During the Archaic period the funeral became an occasion to display aristocratic wealth, power, and prestige, and laws were passed to limit extravagance.

Greek literature frequently refers to the need for burial rites and the insult to human dignity if they are omitted. Though the dead themselves had no power, they had access to infernal powers, notably Hades and Persephone. Accordingly, *katadesmoi* or folded lead plaques inscribed with curses bearing the name of the person to be "bound down" were occasionally placed in graves. The dead person's journey to the next world was effected by elaborate ritual conducted by relatives, primarily women. Priests were not allowed at funerals for fear of incurring pollution, and there was no "burial service" as such. No tomb cult was practised in early times, but in Classical Athens women paid regular visits to the grave. Offerings included cakes and libations, mainly of pure water. Aeschylus has dramatized such visits in the *Choephoroi* and the *Persians*, but with differences of time and place. It was considered so important at this time for the dead to receive the attention of the living that it constituted a reason for adopting an heir (Isaeus, 2. 36. 7, 30).

From Classical times we have descriptions of magnificent public funerals (complete with orations honouring the dead), especially those given at Athens to citizens killed in war (Diodorus Siculus, 11. 33. 3; Thucydides, 2. 34). Their magnificence is matched by the sculptured

gravestones of Classical Athens with their restrained expression of grief. The dead are often depicted performing some familiar act for the last time. The brief inscriptions usually record only the name and parentage, and sometimes the word “farewell” is added. Those who died unmarried at marriageable age received special sympathy, their pathos being underlined by a stone grave marker in the form of a *loutrophoros* or vase used in the nuptial bath. According to Plutarch (*Aristides*, 21), the heroic dead were so powerful that even in his own day (c.^{AD} 46–c. 120) they received blood sacrifice. Those who visited a funeral underwent some defilement, so water from another house was provided on leaving for cleansing: see Hesiod’s advice not to make love on returning from funerals. Cypress branches were fixed to the door to indicate a death within.

Sacrificial offerings were made to the dead from the time of the burial and at the grave. Solon expressly forbade sacrifice of oxen at the grave. Burial was followed by a funeral feast. The soul of the dead man was thought to be present, even to be the host. On the third and ninth days after the funeral, meals were given to the dead man at his grave; the ninth day ended the period of mourning (in Sparta the eleventh). On the fifth day of the month of Boedromion a general *genesia* (birthday) was held by the entire Athenian public for their dead relatives; we also hear of a feast called *nemesia* probably to avert their anger.

At Athens the chief festival was held at the close of the Dionysiac feast of the Anthesteria, in spring, of which it formed the concluding day. On this day the dead swarmed back to the world. Each family made offerings to their own dead. Hermes, on behalf of the dead, was offered cooked vegetables and seeds in pots (hence the name Chytrai). After the feast the souls were asked to leave.

We learn from Plato (*Republic*, 2. 365a) that during the 4th century ^{BC} there were many Greek manuals attributed to Orpheus, Musaeus, and other sages, full of mythology and formulas for initiations. They also contained instructions for calling up the dead for consultation, Hermes being the intermediary. Such formulas are also found in the magical papyri.

In spite of philosophical discussions on reincarnation and the transmigration of the soul, it is strange that such views have left hardly any trace on Greek tomb inscriptions: there are no prayers for a better life at the next birth or for a safe return to old haunts. The doctrines of the religious and philosophical teachers in this regard apparently had little influence on the life and thought of the common people.

Quite different was the case of the Christian teaching of a purgation of the dead, as borne out by Paul’s discovery that at Corinth some

Christians were undergoing a second baptism on behalf of dead relatives (1 Corinthians 15:29). Similarly, Byzantine Christians, believing in the power of the living to influence, through prayers and intercessions, the destiny of the souls of the departed, made lavish donations to churches and monasteries in order to guarantee the proper commemoration of their dead relatives.

Death was viewed by both Christians and Neoplatonists as a liberation from captivity. Nevertheless, both laid greater emphasis on the positive aspect of death as the beginning of a new life. Loud and excessive mourning over the dead was therefore criticized by theologians such as Basil the Great and John Chrysostom, while some radical monastic circles even objected to a special burial service.

Christianity transformed in a special way the rites of the funeral liturgy and certain representations of the hereafter that derived from pre-Christian customs and beliefs. Among the beliefs thus taken over and transformed by the Church Fathers were the soul's journey after death escorted by the *psychopompoi*, a role now ascribed to the angels; Charon's ferry, whose role is now taken by the Church – the ship of souls; the *ephodion* or sustenance for the journey, now provided by the Eucharist or "Holy Viaticum". This last concept is sometimes given a wider meaning to include faith, baptism, or the monastic life. Meanwhile, the traditional funeral meal conducted by relatives at the tomb of the deceased gave rise to the custom of distributing *kollyva* (small round cakes). This practice was unanimously opposed by the Western Church as a pagan superstition, but it survived in the Byzantine Church. The 3rd, 7th (or 9th), and 30th (or 40th) days after death were specially commemorated by the distribution of *kollyva* and the offering of liturgical prayers, which were thought to accompany the dead person on his or her journey, these dates being regarded as marking important stations on the soul's journey either to the final vision of, or banishment from, God. The dead were also commemorated on the anniversary of their death and on the Saturday before Meatfare Sunday.

Death

In ancient Greece death was an everyday occurrence, being prevalent among people of all age groups whether as a result of disease, accident, childbirth, or warfare. Furthermore, it was a far more immediate aspect of the life of the community than is the case in many modern societies. Since there were no hospitals, most deaths occurred either at home or on the battlefield. If death occurred at home, it was the duty of the relatives of the deceased to prepare the body for burial, transport it to the burial ground, and lay it in the earth. Since funerals provided an opportunity for the display of wealth and prestige, many communities, including that of Athens, introduced legislation designed to limit their scale and magnificence.

The most striking evidence of burial practices in Bronze Age Greece is provided by the so-called shaft graves at Mycenae. These graves, dated to the 16th century BC, are cut into the living rock to a depth of several metres. They have yielded some of the richest finds ever discovered on the mainland. In the 15th century a different style of burial developed, in the form of beehive tombs, so named because of their domed appearance. Recent excavations at Lefkandi on Euboea dating to the 10th century BC have yielded evidence of the ritual slaughter of a young woman and four horses on behalf of a warrior, presumably so that they could accompany the warrior to the underworld.

In Homer death is characteristically described in terms of the departure of the psyche "lamenting its fate", from either the mouth or a gaping wound. However, it is worth noting that, of the 240 deaths in

the *Iliad*, only four are described in this way. The psyche is, moreover, a biologically indistinct entity which is rarely referred to except at the moment of death. No other Greek writer gives any explanation as to why the human organism dies, except for Aristotle, who claimed that it was caused by loss of vital heat. Mythologically the idea of a painless death was epitomized by the gentle arrows of silver-bowed Apollo.

Because a corpse was believed to be highly polluting, relatives were required to take elaborate precautions to prevent the pollution from seeping out of the house and into the community. Solon legislated that only close family members and women over the age of 60 were permitted to enter the house of the dead and take part in the funeral. In order to contain the pollution, a bowl of water was placed outside the house so that visitors could purify themselves, and flasks containing olive oil were placed around the couch on which the dead was laid out. In addition, a cypress branch was hung on the door to warn passers-by of the presence of contagion within.

Death was handled almost exclusively by the relatives of the deceased, who were under a sacred obligation to ease transition “from here to there”, as the Greeks phrased it. Though there are occasional references to undertakers in ancient sources, their duties were confined to transporting the corpse from the house to the grave and preparing the ground for burial. It is a reasonable assumption that the Greeks would have regarded the idea of handing over the corpse of a dead relative to strangers as both incomprehensible and inexcusable. This had much to do with the belief that in the period between death and burial the deceased was in a dangerous liminal condition and needed help from his or her relatives in order to secure entry to Hades.

Greek culture not only tolerated but expected extravagant manifestations of grief. Both men and women tore out their hair, rent their garments, beat and lacerated their breasts, and rolled on the ground in the dust. In part this behaviour was prompted by the belief that the deceased took pleasure in witnessing the exaggerated displays of grief that their death occasioned.

As soon as death occurred, the corpse would be prepared for the *prothesis*, or “laying out”, which took place in the house where the deceased lived. First, the eyes and mouth were closed. Female relatives washed the corpse, anointed it with olive oil, clothed it, and then wrapped it in a winding sheet. Finally they laid it out on a couch with the head on a pillow and the feet facing the door. Visitors then came to view the body and dirges were sung in its presence. On the day of the funeral the bereaved accompanied the corpse to the burial site. If the family could afford it, it would be placed in a simple

wooden coffin, though owing to the scarcity of wood it might only be covered with a few branches. The corpse was either borne by pall-bearers or transported in a cart.

Little is known about what took place at the burial service itself, other than the fact that ritualized laments were delivered. Though both inhumation and cremation were practised with varying degrees of popularity in antiquity, cremation was generally regarded as more prestigious, in part because this is how the bodies of Homeric heroes were disposed of. (The most detailed description of a cremation burial is that of Patroclus in Homer's *Iliad*, book 23.) After cremation the ashes were placed in an urn, which was then buried. Once the grave had been filled in, a grave marker was erected. The mourners then returned to the house of the deceased for a commemorative meal. Lastly, the house was ritually purified. Inscriptions from various parts of the Greek world indicate that it was customary to debar relatives from participating in the life of the community for several weeks.

The Greeks did not have cemeteries as such. Those who dwelt in rural areas buried their dead on their estates, whereas city dwellers buried them beside major roads. From around 500 BC the practice of burial within the city of Athens abruptly ceased, perhaps due to a law introduced by the politician Cleisthenes. The ban was no doubt connected primarily with the fear of pollution, but it may also have been due in part to the need to conserve as much residential space as possible. The busiest roads henceforth provided the most popular burial spots for wealthy families, as is indicated by the large number of tombs outside the Dipylon and Sacred Gates on the west side of the city in the neighbourhood known as the Ceramicus, or potters' quarter. In the final decades of the 5th century BC family plots became extremely popular among the wealthy. These were large rectangular spaces walled along the front and at the sides, access being gained from the rear. The popularity of this style of burial may be connected with the belief that members of the family could be reunited in the hereafter if they were buried together.

In Classical Athens concern for the well-being of the dead did not cease after burial. On the contrary, relatives continued to maintain a close attachment to the deceased long after death had occurred, since their welfare in Hades was believed to be dependent upon the attention they received from the living. The anniversary of the day of death was especially important. The dead were believed either to dwell close to the grave or at least to be capable of visiting it when summoned. For this reason a variety of gifts were deposited on the steps of the tomb, including jars of olive oil, myrtle branches, wreaths, cakes, and wine. In addition, the gravestone was anointed with olive oil and coloured sashes were wound around it. In Classical Athens the

care of the dead was considered to be so important that it constituted a reason for adopting an heir.

Festivals in honour of the dead were major features of the sacred calendar. One such was the second day of the Anthesteria festival, which was equivalent to All Souls' Day, since the dead were thought to leave Hades and wander abroad. Most spectacular of all was the annual ceremony in honour of the war dead, which took place in early winter at the end of the campaigning season. An account of the ceremony conducted on behalf of those who died in the first year of the Peloponnesian War was provided by Thucydides (2. 34ff.), who also included the speech delivered by Pericles on that occasion. Only the most courageous war dead were accorded the privilege of being interred on the field of battle. They included the 192 Athenians who fell at the battle of Marathon, around whom a cult was established. The most revered dead were heroes such as Theseus, Oedipus, and Orestes, who were believed to be capable of exerting considerable power within the vicinity of their graves. Their services could be invoked by animal sacrifice. A clay pipe was sometimes inserted into the grave to enable the blood to reach the hero directly. Other important categories of the dead who received special rites include those who had been murdered, suicides, and those struck by lightning.

The Greeks felt particular sympathy for those who died at a marriageable age but who were unmarried. To underline their sad plight, a stone marker in the form of a *loutrophoros*, the vase used for the nuptial bath, was placed over the grave. Generally, however, Greek funerary art is remarkably reserved in its depiction of death and all sentimentality is eschewed. Sculpture depicts the deceased in a domestic setting in the company of family members. A particularly common image is that of two people, either standing or seated, shaking hands. In such cases it is usually impossible to discern which is the deceased and which the living, and we are left wondering whether the handshake is one of farewell between the living and the dead or one of greeting between the newly arrived in the underworld and those less recently arrived.

By definition death separates the world of mortals from that of the gods. Though the Olympian deities occasionally mourn the passing of a favourite, for the most part they are indifferent to human loss. Their removal from the physiology of death was due to the fact that proximity to the dying and the dead exposed them to risk of pollution caused by death. As Artemis observes in Euripides' *Hippolytus* (1437f.), it is not permitted by divine law for a deity "either to look at the dead or to sully their eyes with the expirations of the dying". For the same reason no priest or priestess was allowed to enter the house of the dead or attend a burial.

Delian League

Major source of Athenian power in the 5th century BC

The Delian League, a modern name for what was originally called “the Athenians and their allies”, was established in the winter of 478/77 BC and lasted until the defeat of Athens by Sparta in 404 BC. It arose from discontent with Spartan leadership of the Greek war effort against Persia in the aftermath of the great victories in 480–479 and, particularly, with the conduct of the regent Pausanias in 478. According to Thucydides, the non-Peloponnesian allies, and especially the Ionians and those recently freed from Persian rule, approached the Athenians to lead them and they decided to take advantage of the situation (1. 95. 1–2).

The Athenians quickly settled on the contributions to be paid by members of the new alliance, either ships fully equipped for a campaigning season or money in lieu of personal service (*phoros*, usually translated as “tribute”), and arranged for a council (*synodos*), at which each member had one vote, to meet at Delos, where the treasury was established. Alliances at this time usually had a specific duration, but here the allies threw lumps of iron into the sea to bind everyone, including the Athenians, forever.

Several aspects of the alliance remain controversial, including its purpose, its extent, and the size of its revenues. Regarding its purpose, Thucydides says that the “pretext” (*proschema*) was to punish Persia

for damage done (and to liberate any Greeks still enslaved: 1. 96. 1; cf. 3. 10. 3; 6. 76. 3); so this was not really a *symmachia*, an alliance whose members swore unconditionally to have the same friends and enemies (the word “pretext” may refer to later Athenian practice, when the league had become an Athenian empire and its resources were used for general Athenian purposes). As for its extent, there is no specific information about its membership at the beginning, though it seems likely that most non-Dorian islands of the Aegean plus coastal cities in northern Greece/Thrace, the Hellespontine area, Aeolia, and Ionia quickly joined; ultimately, there were over 200 members (cf. the Athenian tribute lists for 447–446 BC). With regard to finance, Thucydides states that the “*original* tribute” was 460 talents (1. 96. 2), which implies subsequent adjustment; and indeed, in speaking of Athens’ finances at the outbreak of the Peloponnesian War in 431 BC, he says that 600 talents of *phoros* came from the allies each year on average, exclusive of other revenue; there was also a reserve of 6000 talents, which had once been as large as 9700 talents. However, the detailed records of league monies entrusted to Athena for safekeeping after the transfer of the treasury from Delos to Athens (probably in late 454 BC) suggest that the revenues deposited in Athens rarely, if ever, exceeded 400 talents per annum in the period 454–426 BC. Various attempts to explain this seeming contradiction include failure to pay/late payment by the allies, reduction of the tribute after c.467, and error on Thucydides’ part: none of these suggestions is satisfactory and probably the best that can be done with this problem is Unz’s suggestion (1985) that the amounts deposited in Athens represent surpluses from fleet operations, costs of maintaining bases and garrisons, and possibly shipbuilding in allied yards, all of which items were paid for on the spot from local or district revenues.

It cannot be denied that the league fulfilled its initial purpose: Persian bases in the north Aegean area were captured, the Dorian cities of southwest Asia Minor were liberated, an apparent Persian invasion force was intercepted and smashed in battle near the mouth of the river Eurymedon in Pamphylia, expeditions were sent to Cyprus on at least two occasions, and there was a major attempt to detach Egypt from the Persian empire (459–454 BC), all of which resulted in either a formal peace (“the Peace of Callias”) or an agreed informal cessation of hostilities in c.450–449 BC. At the same time, however, the Athenians saw and seized upon opportunities for their own benefit and power: certain states were forced to join the league, many were prevented from leaving, and those that fell foul of Athenian rigour in insisting on punctilious fulfilment of membership obligations found themselves reduced to the level of “subjects” through the imposition of separate, bilateral “agreements” between themselves and Athens.

The results of this were often humiliating – surrender of warships, dismantling of fortifications, obligations to submit certain types of court case to Athens for final judgement, acceptance of garrisons and overseers, imposition of “democratic” constitutions, provision of troops over and above the payment of *phoros*, adherence to Athenian standards in weights and measures, enforced participation in Athenian religious festivals, and, finally, a requirement that all adult citizens swear various oaths proclaiming loyalty, goodwill, and even love towards Athens.

The conversion of an originally free and voluntary alliance into an Athenian *arche* (empire) was well under way by 450 BC, and after this empire had received formal acknowledgement in the Thirty Years’ Peace (446/45 BC), the Athenians would refer to it as such, quite casually, and even argue that they had a perfect right to it. This attitude gave rise to increasingly severe punishments for rebellion, as in the case of Mytilene in 427 BC, outrages such as the destruction of Melos for refusing to accept Athenian control (416/15 BC), and the culminating *hubris* of the Sicilian expedition of 415–413 BC.

Throughout history, assessments of the significance of the Delian League have tended to be ambivalent. The radical democracy of the Periclean age owed much to the cash from the league, which made possible many of the benefits widely available to Athenians, while the stored-up surplus (see above) paid for the great building programme undertaken on the Acropolis after 450 BC. However, Pericles was criticized at the time for “decking out the city like some vain woman ... with thousand-talent temples” (Plutarch, *Pericles*, 12. 2; cf. the witty and sarcastic oligarchic pamphlet known as Pseudo-Xenophon, *Athenaion Politeia*), and although Athenian opinion in the 4th century regarded Periclean democracy as a class system whereby the “many” exploited and bullied the “few”, there was, especially after the humiliating “King’s Peace” of 387 BC, great pride in the power that Athens had wielded through the Delian League.

In modern times the period of the league has always been regarded as the “golden age” not only of Athens but of Classical Greece as a whole. However, even attitudes towards the league itself are still hotly debated: for example, in the 1950s and 1960s the question of whether or not the Athenian empire was “popular” among its subjects became an issue of Cold War rhetoric, with an English Marxist scholar arguing that it represented a liberation movement for oppressed masses in the various member states, while a US historian denied this with mutterings about “these days of ‘People’s Democracy’”. Though this debate was conducted in somewhat simplistic terms, deeper consideration of the reality of the Delian League serves to remind us of two important truths: first, when Pericles describes the Athenian

empire as a “tyranny” and when Cleon echoes this and describes its subjects as “disaffected conspirators”, these are *politicians* attempting to persuade people to do something which they would not normally wish to do: politicians do not always tell the truth; second, given the polarization of Greece in the 5th century BC between Athens and Sparta, the average small state, although possessed of a typical Greek love of autonomy, was faced with a disagreeable choice: it is possible to *prefer* one of two options without particularly *liking* either of them (cf. the thoughts of Phrynichus described by Thucydides at 8. 48. 5–6).

Delos

Aegean island

Delos is a small island, surrounded by a circle of larger islands known collectively as the Cyclades. It is largely waterless and with little agricultural land. Its importance in antiquity therefore derived primarily from its religious significance, as one of the principal and international sanctuaries of Apollo. Greek mythology related that when Leto, pregnant by Zeus, was about to give birth, no place would receive her in case it incurred the wrath of Hera. Delos, which was

then an unfixed, floating island, was the exception, and sheltered Leto, who gave birth there to Artemis and Apollo. In gratitude, Apollo fixed the island in its present location. Like most myths, this is a preposterous story, but there is no clear material reason why the island should have assumed its sacred character.

Evidence for activity on Delos dates at least as far back as the Late Bronze Age. Mycenaean remains, traces of walls and deposits of objects including figurines have been found in the area of the later Classical sanctuary. A revival or redevelopment of the island came with the general reawakening of the Greek world in the 8th century BC, and as a result of interest from the surrounding Cyclades. Particularly significant was the island of Naxos. By the end of the 7th century the Naxians had built a simple rectangular structure, its ridge supported eventually by a single row of thin marble columns, and later referred to as their Oikos, or house; it is very likely that this was in fact the first temple dedicated to Apollo. The marble for the columns was quarried on Naxos and shipped to Delos. Also of Naxian marble, and very spectacular, was a colossal statue of Apollo erected around 600 BC at the side of the Oikos. Only fragments survive, but they give an indication of the statue's original size. It stood on a single enormous block of marble, $c.5 \times 3 \times 0.82$ m, estimated to weigh about 32 tonnes; the statue itself was about four times life size, and therefore larger than the colossal statue in the sanctuary of Hera at Samos (much better preserved), which is about three times natural size. The Apollo statue copies the pose of the colossal statues of Egypt but, unlike them and like the Samian statue, was probably nude.

Towards the end of the 6th century Naxian influence waned, and eventually Delos came to be dominated by Athens, a domination that was to endure, with intervals of independence, for much of the island's history. During this first period a limestone temple was dedicated to Apollo; the building technique is similar to that of Athenian buildings. Delos was treated with respect by the Persians, with the intention of securing the sympathy of the Greek states, but after the defeat of Xerxes in 479 BC Delos became instead, under the protection of Apollo, the centre of the Delian League dominated by Athens with the purpose of keeping the Persians out of the Aegean and liberating the east Greek cities. Twenty years later, with the renewal of the Persian threat, the treasury and control of the league were transferred to Athens. The festival of Apollo continued and was of great significance still to the Athenians, who would dispatch each year one of the state triremes, the oared warships which had won the battle of Salamis. In 426 BC the Athenians went even further. Concerned that the plague which had decimated the population of Athens indicated that they had incurred the wrath of Apollo, the god

of healing, the Athenians “purified” the island. Because of its sacred character laws prohibited birth and death on the island: pregnant women, and all those about to die, had to leave for the neighbouring island of Rheneia. Despite this there were many graves there (many perhaps dating to the prehistoric period). These were cleared and the contents shipped to Rheneia. The Athenians also built a new, marble temple to Apollo, in the Doric order: uniquely, it shows in its design the influence of the Parthenon.

By this time the island certainly had its own resident population, though as yet there is little archaeological evidence of the settlement they inhabited. With the defeat of Athens in the Peloponnesian War they attempted to reassert their independence, only to have the Athenians return in 394 BC. It was not until 80 years later, in the very changed world that followed the Macedonian conquest and the confusion that resulted from the break-up of Alexander’s empire, that Delos became independent. All the same, it was used by the various successors of Alexander, particularly Ptolemy I and then Antigonos Gonatas, as the centre for their own island leagues by which they hoped to control the Aegean. This domination also meant patronage. The kings founded festivals (in their own honour, as much as Apollo’s); they also had buildings constructed in and around the sanctuary, particularly porticoes (stoas). Most intriguing is a long narrow building east of the temples, the so-called Monument of the Bulls, because of the bulls’ heads that rise above two internal half-columns. It was probably the Neorion, a ship shed in which one of the Hellenistic kings – almost certainly an Antigonid since these kings used the bulls’ head motif elsewhere as in the Stoa of Antigonos – dedicated a ship in consequence of a naval victory; either Demetrius Poliorcetes, after the crucial battle of Cypriot Salamis in 306 BC, or his son Antigonos Gonatas, after the battle of Cos in the mid-3rd century BC.

In many ways the heyday of the island was in the 2nd century BC, particularly the years after the final Roman defeat and dismemberment of the Macedonian kingdom. The Romans restored the island to Athenian control, but this was a much weakened Athens, and the reality was Roman domination under a suitable disguise. Delos was declared a free port, and as such seriously interfered with Rhodian trade when that island, an erstwhile loyal supporter of Rome, displeased the Romans through half-hearted support in the war against Macedon. The island received an influx of Roman and Italian settlers, along with traders from other places, such as Berytus (modern Beirut). Under the settlers and the Greek inhabitants the area of the town increased considerably, with many luxurious houses, typically with splendid (though later robbed) mosaic floors, marble columns

round courtyards (beneath which were deep storage cisterns to alleviate the perennial water shortage), and walls built of local stone which were plastered and decorated with elaborate painted designs. Trade was vigorous; Delos, despite its religious significance, was an important place for the sale of slaves, many derived from the hinterland of Anatolia.

In the disintegrating political conditions of the 1st century BC, after the kingdom of Pergamum was bequeathed by its last king to the Romans, piratical raids from the harbours of southern Anatolia grew in intensity. Delos, a small island with no defensive system, was particularly vulnerable. In 88 BC it was seized by the troops of Mithridates king of Pontus in his war against the Romans, and pillaged. The destruction was completed by his allies, the pirates of Athenodorus, in 69 BC. Even the special centre sections of the mosaic floors were removed, and the town abandoned.

Thereafter, though the island continued to function religiously, activity was on a small scale. There are indications of a Christian population in the 3rd century AD, but the island was finally sacked in the 8th century AD, and then awaited its rediscovery by western scholars, beginning with Cyriac of Ancona who visited the island in 1445.

Delphi

Ancient sanctuary of Apollo in central Greece

Delphi was the principal sanctuary of Apollo on the Greek mainland, situated on a shelf of land on the southern slopes of Mount Parnassus, and looking out to the sea at Itea and the gulf of Corinth. It was therefore accessible from the Peloponnese by sea across the gulf. Land routes linked it with the isthmus of Corinth and Athens by way of Thebes in Boeotia, while another route passed directly to the north, to the back of the mountains above Thermopylae and down to the plain of Lamia. Geographically it belonged to the district of Phocis (whose

most important city, Amphissa, was only a short distance away), but such was its religious importance that it was controlled rather by a special international body, the Amphictyonic Council, the council of “those who dwell around”, i.e. the surrounding communities which had a special interest in the religious significance of the place. In addition to the sanctuary there was a small adjacent town, but this was little more than ancillary to the religious function.

The reason for its religious significance (outside the mythology attached to it) is nowhere stated, but it was probably a combination of its generally awesome character, with the towering cliffs of the mountain immediately above, and the abundant supplies of water from its springs, including what was probably the most renowned spring in Greece, Castalia. Delphi originated in prehistoric times, and there are traces of walls and the usual deposits of figurines from the Late Bronze Age. According to myth, Apollo took over the sanctuary from its previous owner, Gaia. This may represent a change of presiding deity during the period that followed the political and cultural collapse of the Late Bronze Age communities, but everything seems to have been on a small scale, and there are no significant remains until the 6th century BC.

From the religious point of view, Delphi was most famous for its oracle. Pilgrims to the sanctuary could present their enquiries to the Pythia, the priestess, who mounted the sacred tripod in order to respond: the belief that she would go into a trance and rave is now discredited. Most famously, the enquiries were for predictions of the future, many of which are recorded by Herodotus, most notoriously the reply given to the non-Greek king of Lydia, Croesus (who was a great supporter of the sanctuary, showering it with expensive dedications, having been impressed by its efficacy). His last consultation was to enquire what would happen if he engaged in war with Cyrus, king of Persia. The oracle replied that a great empire would be destroyed, but omitted to say which. Croesus thought it meant the Persian empire, so went to war: in the event, it was his own empire that was destroyed. Most of these apparent oracular responses were probably inventions, and actually postdate the events they were meant to predict. They tended to obscure the true nature of the questions and responses, which was to seek guidance concerning the proper course of action to be followed in given circumstances. These could be for an interpretation of religious behaviour – what was right and proper – where the oracle was believed to have specialist knowledge and status far removed from mere fortune telling. The oracle, and its representatives, must have acquired a fair general knowledge of the world in which the Greeks lived, practical as well as religious. Advice was given on whether to send out a colony, or

where, and what procedures would be desirable. The oracle was not above being influenced by others. In the last quarter of the 6th century BC a splendid new temple was built to Apollo, surrounded by a complete peristyle of Doric columns. It was to be built, as was most Delphian architecture, in the local limestone. The Athenian politician Cleisthenes undertook the contract (which meant he was financially liable if the work did not come up to the required standard), but for the east front and its pediment sculpture he provided at his own expense costly imported white marble from Paros. This was not altruistic; in return, the oracle responded to consultations by the Spartans by putting pressure on them to intervene and secure the return of Cleisthenes from exile to Athens. It worked.

The sanctuary consisted of a series of terraces, rising one above the other and linked by a “sacred way”, a processional route which zigzags from the lowest terrace to the front of the temple at the middle level. Cleisthenes’ temple was destroyed by a fall of rock in the 4th century BC, but was rebuilt to the same plan and design, the funds this time being collected by contributions solicited from the whole of Greece. Lining the sacred way were dedications to Apollo given by cities which had cause to be grateful to him. These included statues, or groups of statues set on bases of various forms and elaboration, up to complete buildings, the so-called treasuries (a misleading translation of the Greek term *thesauros*) some of which were elaborately decorated miniature temples. The most elaborate example was that given by the Cycladic island of Siphnos in gratitude for the discovery of a rich vein of silver on the island. Female figures (usually called Caryatids) replaced the more usual columns of the porch, which in this case would have been in the Ionic local to Siphnos, not the Doric of the mainland. Lavish sculpture also decorated the frieze and pediments. Nearby is the treasury of the Athenians, which perhaps celebrated Cleisthenes’ return and the restoration of democracy at Athens, though many scholars believe it was a thankoffering for the victory at Marathon some 20 years later. Another famous offering was the tripod, a bronze cauldron supported on a column formed by intertwined snakes of bronze. This celebrated the Greek victory over the Persians at Plataea. The commander of the Greek allies, the Spartan regent Pausanias, boastfully put his own name on it. This caused offence, and the name was removed; instead the column was engraved with the names of the Greek states which had fought together against the Persians. It was eventually removed in the early 4th century AD by the Roman emperor Constantine, who took it to his New Rome, Constantinople, where part of it still survives.

There were many more memorials, and the sanctuary was enlarged in stages to accommodate them all. Round it was a substantial

perimeter wall, the *peribolos*, also extended and improved over the ages, but which eventually, in the Hellenistic age, burst its seams with some buildings, such as the Stoa of Attalus, being constructed over it. In addition, several buildings were built below the main sanctuary including a second, smaller sanctuary, with a succession of temples of Athena, more treasuries and the circular Tholos, a Doric building of the 370s BC, the purpose of which, and, indeed, proper name, is uncertain. Nearby stood a gymnasium.

The sanctuary continued to flourish in the Hellenistic age. It was consulted by the Athenians early in the 1st century BC, when they wanted to restore religious practices which had ceased with the passage of time. It was supported by the Romans, and continued to be consulted and respected into the 2nd century AD. In the confusion of the 3rd century AD it fell into decline and evident disrepair. Attempts were made to tidy it up, but with the conversion of the empire to Christianity its purpose was lost. The emperor Julian tried to revive it as part of his restoration of paganism in the 360s, but the authorities had to make the sad reply “Tell the emperor that my hall has fallen to the ground. Phoebus no longer has his house, nor his mantic bay nor his prophetic spring: the water has dried up.”

Democracy

When the Athenians finally settled on “democracy” to describe their characteristic form of government, the term won out over several competitors: *iso-kratia* (equality of power), the Ionic word *is-egoria* (equality of expression), perhaps also *iso-moiria* (equality of sharing). Originally, “demos” meant the whole people, including aristocrats, but by the 5th century BC it came to imply, if not actually connote, the common people, the plebs. *Demo-kratia* means “power (*kratos*) exercised by the whole people (*demos*)”, and it was used in explicit contrast to other more restricted forms of government such as *aristo-kratia* (power held by “the best”) and *olig-archia* (“rule by a few”).

Democracy had roots and antecedents. Already in Homer's day (perhaps 725 BC) rulers had lost, or were losing, whatever autocratic power they may have once possessed. The Greek high command at Troy felt it prudent, if not necessary, sometimes to summon assemblies to hear proposals and – ideally – ratify them without significant opposition. In *Iliad* 18 Achilles' shield is described as depicting some kind of popular gathering engaged in judging conflicting legal claims. At the end of the *Odyssey* the Ithacans assembled to debate alternative courses of action in response to Odysseus' slaying of the suitors. "Dark-Age kingship", a shadowy and poorly documented period, gave way in most Greek cities to oligarchic rule by a fairly wide circle of aristocratic families. Best attested is the government of the Bacchiadae at Corinth, and in many states, e.g. Thebes, this was the form that prevailed, with variations, through the historical period.

Sparta was an exception to this pattern. Here, in the mid-7th century, there occurred an experiment in a kind of proto-democracy. A document known as the "Great Rhetra" records a brief interval around 650 BC when the assembly of all Spartan citizens had the right to "speak in opposition" and make modifications to legislation introduced by their two kings and council of elders. The privilege lasted a generation at most, after which the legislative process reverted to the system familiar from other oligarchies in which the popular assembly served as little more than a rubber stamp of proposals put to it by the ruling council. Also of interest is an inscription from the island of Chios dated 575–550 BC that details a judicial procedure involving "(legislative) enactments of the *demos* [people]" and a "council of the *demos*" to hear judicial appeals.

First moves were made towards democracy at Athens when Draco produced a law code about 621 BC. Although it was remembered as having been extremely harsh, the very fact that it was written down was a step towards justice for the ordinary citizen, who now had some recourse against arbitrary decisions by the aristocrats. A reasonable claimant to the title "Father of Athenian Democracy" was Solon, a far-sighted and imaginative individual who revamped the Athenian law code in 594 BC. Athens was on the brink of class warfare brought about in part by an antiquated system of land tenure that allowed wealthy landowners to take over smallholdings and reduce their former owners to the status of indentured serfs. One of the slogans attributed to Solon was "equality breeds no war", but what he brought about was equality not of possessions – he resisted demands made by the poor to redistribute the land – but rather equality before the law. He is reported to have said, when asked what he considered the best city to live in, "the one in which those people who are not wronged, no

less than those who are, come forward and punish the wrongdoer". From now on anyone who wished could seek legal redress on behalf of one perceived to have been a victim of injustice, and magistrates' decisions could be appealed to a jury court. According to Aristotle, "Solon appears to have set up the democracy by constituting the jury courts from all the citizens" (*Politics*, 1274a1ff.).

The period after Solon was marked by civil unrest and a spell of "tyranny" by Pisistratus and his sons. Luckily for the Athenians, their lawcode was left intact; the Pisistratids merely manipulated it in such a way that their own supporters were usually in positions of authority. After the tyrants were driven out in 510 BC there was a danger that matters would collapse into a melee of aristocratic infighting, but one of the contenders, Cleisthenes the Alcmeonid, swung the balance in his favour by promising the *demos* reforms. Cleisthenes effectively cut through and dismantled local fiefdoms based on the aristocrats' control of religious and political activity within their own regions. Cleisthenes regrouped the citizen body along national lines. Voting on important matters and serving in the army were henceforth to occur within a complex and artificial system of ten newly created tribes, whose distinctive feature was that they were composed of members from widely disparate districts of Attica. Moreover, Cleisthenes either created a legislative council for the first time or drastically refashioned an earlier and more primitive *Boule* (council) instituted by Solon. As will be seen, the *Boule* was the pivot around which the whole democratic legislative apparatus functioned.

A further important step towards democracy was made by the reform of the Areopagus, Athens' senior council, by Pericles and Ephialtes in 462 BC. Most of the judicial functions of this venerable body were distributed among the Council of 500, the Assembly of the people, and the lawcourts. Probably at this same time Pericles also introduced a bill that provided a daily allowance to members of the juries. This made it possible for poorer citizens to put their names forward to serve on the juries, and gave substance to the claim that an Athenian brought before a court of law was given a trial before a "jury of his peers". It was a characteristic of the full-blown democracy that payment was subsequently instituted for other kinds of public service: discharge of duties as a councillor, infantry duty, rowing in the fleet, and, finally, attendance at meetings of the Assembly and, for citizens who could demonstrate financial need, admittance to the major dramatic festivals.

What made Athenian "democracy" truly democratic in practice was the ubiquity of the lot as an instrument of selection. Certain officials were elected: the ten generals, one from each of the (Cleisthenic) tribes, and other officers whose functions were rather specialized, like

treasurers. Otherwise, allotment to office was the rule, from the annual archons down. This system of allotment was all-pervasive. There are references to boards of “contractors”, “market supervisors”, “weight-and-measure superintendents”, “inspectors of dockyards”, and so on, so that the figure of 700 for such annually rotating officers, preserved in the *Constitution of Athens* but sometimes doubted, seems entirely believable.

If sovereign power rested with the *demos* collectively assembled, which had responsibility for war and peace, taxation, foreign affairs, and other important matters touching on the welfare of the body politic, what assured relatively smooth functioning of the whole apparatus was the Boule or Council of 500, ten tribal contingents of 50 chosen annually by lot and known as *prytaneis* (with the tenth part of the year in which they served known as a “prytany”), who took it in turn in a sequence decided by lot at the end of the preceding prytany to prepare the agenda for the Assembly. The 50 *prytaneis* met daily and actually lived together for their 35 or 36 days in a special building, the Tholos. Effectively, the day-to-day running of the Athenian state fell to them. They had the further duty of selecting, also by lot, one of their number to preside at their own meetings and at the meetings of the Assembly, which were held normally four times each prytany, that is, 40 times a year. On a famous occasion the lot fell to Socrates, whose tribe held the prytany at that crucial juncture, to act as president of the Assembly when the motion was brought to try as a group the generals who had been charged with dereliction of duty for failing to rescue survivors after a naval battle off Lesbos in 406 BC. Because he was unwilling to contravene a law requiring defendants to be tried individually and not as a group, Socrates refused to have any part in the proceedings. He was replaced by someone (whose name is not recorded) more willing to compromise his principles and connive at illegality.

No councillor could serve more than twice in his lifetime, and then not for two years in succession. Thus, there was no possibility of a cadre being formed, or the development of any continuity of interest, especially covert. Figures for the total population of Athens in the Classical period can only be guesses, and estimates of the percentage of male Athenian citizens who would have served on the Boule at least once in their lifetimes range between one-third to one-half (J. O’Neil) and 70 per cent (R. Osborne). The whole system was one of absolute equality. Men of varying interests, abilities, and backgrounds served together, on a temporary basis, and because of the transregional nature of the tribal membership noted above, it was the city as a whole whose needs were being served, not those of individual districts, nor of segments or interest groups within the population.

There is evidence of a cult of Demos, the Athenian populace conceived of as a collective abstraction, on the Hill of the Nymphs near the Pnyx at Athens from before 450 BC. Before the end of the 5th century the abstractions *Demokratia* and *Oligarchia* appear as personified opponents, and a cult of *Demokratia* is attested on inscriptions from the 330s. In this period also *Boule*, the personified Council, appears as a parallel abstraction. A surviving relief sculpture on a decree dated 337/6 from the Athenian Agora shows *Demokratia* crowning a dignified-looking, sceptred Demos who is seated on a throne. Athens was not alone in iconographically honouring *Demokratia*, for a statue of the goddess is depicted on a coin of Cnidus dated 300–190 BC.

Democracy defined the Athenian political ethos as at no other ancient Greek city, but there are traces of democratic periods elsewhere: Syracuse, Mantinea, Argos, Corfu, Rhodes, Thurii, Tarentum, Heracleia on the Pontus, Thasos, Epidamnus, and possibly Megara. When at the height of their imperial power, the Athenians tried to impose their democratic system on various dependent states, among them Boeotia and, in Ionia, Erythrae and possibly Miletus.

Aristophanes in *Knights* and Plato, the comic writer, in a play whose title is not preserved made fun of Demos as a cantankerous old man all too willing to be flattered, duped, and led astray by wily but unprincipled politicians. Other critics, such as the historian Thucydides and the philosopher Plato, were more scathing. What such critics feared was the tendency of an electorate to disintegrate into an unruly mob, like (in Plato's vivid image) a raging beast, unwilling to take direction from enlightened (i.e. aristocratic) leaders and yielding instead to the self-serving cajolery of (plebeian) demagogues. This continues to be the paradox of any modern democratic system, where large populations and an inflated governmental apparatus seem to require some kind of representation rather than the direct democracy of ancient city states: since election to office today depends upon heavy financial outlay by candidates, who, if elected, must then spend much of their time trying to divine the voters' sometimes only vaguely formulated and often inconsistent desires, the term "politician" has become more a label of disparagement than a job description.

Long after Athens had lost any claims to importance on the world stage or independence of political action, it maintained the forms of its democratic past: a decree survives from about AD 220 mandating a revival of the Eleusinian festival that opens with the characteristic formula, "It was decreed by the Demos". Such associations with popular government, however, gradually lost favour during the Roman period. By the 5th century AD the word "democracy" had acquired distinctly adverse connotations and for the Byzantines it

came to mean a popular disturbance or riot.

Demography

Demography as a scientific study of the size, distribution, and composition of human populations did not exist among the ancient Greeks. Moreover, in studying the population of ancient Greece and the relations between its component parts (such as old and young, male and female, slave and free, etc.), modern demographers are hampered by the lack of reliable figures and statistical information.

After the rediscovery and spread of the art of writing, and at least from the 6th century BC, the Greek states must have kept records concerned with the status and duties of citizens or with financial obligations and benefits, but such records would have applied to free men rather than slaves, and to adult men rather than women and children except in so far as these latter were involved in matters of citizenship. There are more inscriptions from the 4th century BC onwards, but these are generally religious, social, or honorific and it is uncertain to what extent local figures of population levies were consolidated and recorded in any permanent fashion.

Due to the emphasis that ancient historiography placed on warfare, most available data relate to the size of military forces or to the manpower available for military purposes. In other words, they refer only to adult male citizens. From such numbers attempts have been made to estimate the size of the entire population including women, children, and slaves. For example, Gustave Glotz's estimate (in *Ancient Greece at Work*) of the population of Attica during the Classical period is based on the number of Athenian hoplites at the beginning of the Peloponnesian War, as stated by Thucydides: according to this calculation there were then some 40,000 adult Athenian citizens of all classes, making with their families a total of 140,000, with about 70,000 metics and probably between 150,000 and 400,000 slaves.

Censuses of citizens were rare in the ancient Greek world. Only one census is recorded for Classical Athens, the one carried out by Demetrius of Phaleron in the late 4th century BC, whose results are preserved by Athenaeus (6. 272c). No results for Greece or any other region are preserved from the Roman censuses mentioned in the Gospel story of the birth of Christ (Luke 2: 1–2).

Information regarding changes in settlement patterns in ancient Greece, probably connected to population fluctuations, is supplied by intensive archaeological field surveys. Although there are local variations during all periods, the general pattern is of a sparsely populated landscape in the 11th and 10th centuries BC, followed by a substantial increase in most areas from the 9th century BC, culminating

in the period from the 5th to the 3rd centuries BC and declining in the last two centuries BC and during the Roman empire. It is thus possible to accept the growth of population as at least a partial cause of Greek colonization from the 8th century BC onwards, as it undoubtedly was after the time of Alexander the Great. It is, however, difficult to say whether the colonizing activity of the Archaic period led to a long-term reduction of population in mainland Greece. This activity continued until the 6th century BC, after which there was opposition in the West from the Carthaginians, Etruscans, and Illyrians; and the suitable sites around the Aegean Sea were all occupied. Cities then began to grow, and to produce goods, with the help of captured slaves, partly in order to pay by exports for the corn they now had to import.

There were no birth or death certificates in ancient Greece and, consequently, ages given in literary sources are generally unreliable. However, a study of the relationship between the age and sex of a skeleton and particular grave goods can be useful in the investigation of prehistoric social organization (Halstead, 1977). Study of the skeletal remains of male individuals of the Early, Middle, and Late Helladic periods from the Greek mainland and the islands reveals a morphological homogeneity of the population throughout the Bronze Age (Xirotiris, 1980).

A high level of infant and child mortality in Classical Greece is suggested by excavations of cemeteries. There is even less evidence for fertility rates than mortality rates, but fertility levels must have been much higher than in advanced modern societies. For, although family limitation measures such as infanticide or abortion may have been practised in some social classes, religions, or periods, the high infant mortality must have encouraged large families to ensure that some children reached adulthood to inherit the property, provide additional farm labour, and support the parents in old age. A very important factor influencing fertility levels is the average age of marriage, particularly for women, and the few references in literary sources (e.g. Hesiod, *Works and Days*, 695–98) suggest a pattern of late marriage for men (around 30) and early marriage for women (mid- to late teens), the latter making high fertility rates possible. In their ideal states both Plato and Aristotle provided that parents should breed only when in their prime. Plato puts this for women at from 20 to 40 years of age, for men from the end of their prowess at racing until 50 (just like stud horses). Aristotle wished women to marry at 18, men at 37: they were then in the prime of life respectively, and the decline in the powers of both would coincide.

On the other hand, the emancipation of women in the Hellenistic age was accompanied by a revolt against wholesale motherhood, and

the limitation of the family became the outstanding social phenomenon of the age. Abortion laws became more lenient, and exposure of children more common. In the old cities families raising more than one daughter would be one in a hundred: according to Poseidippus, "even a rich man always exposes a daughter". Sisters were a rarity, but one-child or childless families were common. Around 200 BC, out of a total of 79 Milesian families, 32 had one child, 31 had two; altogether they had 118 sons and 28 daughters (Gustave Glotz, *Ancient Greece at Work*, 1965, p.298; W.W. Tarn, *Hellenistic Civilisation*, 1927, p.86). At Eretria only one out of 12 families had two sons, and hardly any had two daughters. Infanticide received the approval of some philosophers (though not of Socrates/Plato in the *Republic*, who recommends only the separation of inferior children from the guardian class: cf. Mulhern, 1975) as a means of reducing the pressure of population; but the practice spread among the masses to such an extent that the death rate overtook the birth rate. The extent of family limitation may be gleaned from the fact that by forbidding it Philip V of Macedon raised the manpower of his country by 50 per cent in 30 years (Tarn, p.88). Around 150 BC Polybius (36. 17) lamented the desertion of the cities and the unproductiveness of the land resulting from a low birth rate and a general decrease in the population. He ascribed this to selfishness and indolence, and to a desire to give one's children too high a standard of living. But it may equally well have been due to demoralization and reluctance to bring children into a world of incessant war, revolution, banditry, and violence in general, with a high chance of poverty, enslavement, or early death. And if it is true that Aemilius Paullus, after defeating king Perseus of Macedon at Pydna in 167 BC, carried off 150,000 into slavery from the region of Epirus alone, there we have an example of one cause of depopulation, and of demoralization among the remnants (Wilkinson, 1979, ch.1).

It has been suggested that some 10 per cent of females may have been exposed at birth in order to avoid an excess of marriageable women (Golden, 1981). But this hypothesis cannot be demonstrated, and would require the unwarranted assumption that the Graeco-Roman era had a sustained surplus of births over deaths. It has been pointed out that a high rate of female infanticide was impossible for any ancient population since it would cause a decline in a nearly stable population (Engels, 1980, 1984).

Our extant evidence is mainly concerned with Athens and largely confined to the 4th century BC. It consists of fragmentary sources such as lists of *epheboi* (young men undergoing military training), *bouleutai* (councillors), and *diaitetai* (elderly men serving as arbitrators). It is not clear whether these groups were recruited from the entire body of

adult male citizens or from only among the hoplites and the upper classes. According to Hansen (1989) ephebic rosters cannot be used to calculate accurately the total number of Athenian citizens during the 4th century BC. Every Athenian boy of 18 was registered in the deme of his father, and the total of these deme registers formed the list of those entitled to take part in the assembly. Similarly there were lists of 18-year-old boys eligible to become *zeugitai* liable to hoplite service and *thetes* liable to service in the Athenian navy. Both boys and girls were enrolled in their phratries, but there were no other records of citizen women. Demetrius' census enumerates 21,000 citizens, but it is uncertain whether this figure includes all citizens or merely those liable and fit for hoplite service. The number of metics, which is given as 10,000, is the only figure for this status group that has come down to us. Metics were required to pay a tax and were registered in their deme of residence.

The suggestion of Herodotus (5. 97. 2) that there were about 30,000 Athenian citizens in the early 5th century BC has sometimes led to the indiscriminate assumption of this figure for the rest of the Classical period as well. However, evidence of the size of Athenian military forces during the 5th-century BC empire suggests that by the middle of that century there were at least 50,000 or possibly even 60,000 citizens, thus indicating a substantial growth since the early 5th century BC. This level was maintained until the beginning of the Peloponnesian War, when it began to decline as a result of the plague and the heavy casualties in battle, especially during the expedition to Syracuse in 415–413 BC. Moreover, after the introduction of Pericles' citizenship law of 451 BC, the Athenian citizen population was doomed to be stationary or to decline. Any significant increase in the number of citizens was ruled out by the strict rules for accepting new citizens combined with the continuous emigration from Attica (Hansen, 1982).

Most uncertain of all is the number of the slave population. The Athenian census of Demetrius records their number as 400,000, and similar incredibly high figures are given for Aegina and Corinth as well in sources of varying reliability. Thus, around 350 BC, Aristotle calculated that Aegina had a population of half a million, of whom 470,000 were slaves (Calhoun, pp.30–31). Nevertheless, there may have been considerably more slaves in the time of the 5th-century BC Athenian empire than there had been earlier.

Although Laconia had much of the richest land in Greece, it was thinly populated. According to Herodotus (7. 234. 2; 9. 10. 1), Sparta had 8000 potential soldiers in 480 BC, and in 479 BC 5000 actually took part in the Battle of Plataea. However, by Aristotle's time the citizen population seems to have come down to fewer than 1000 and the causes of this decline have been much debated: such diverse factors as

the structure of Spartan society, casualties in war, inheritance patterns, and the earthquake of c.464 BC have been invoked to explain it. In the opinion of Aristotle (*Politics*, 1270a29–34) this serious problem of manpower shortage was the reason for Sparta's downfall. Yet we must remember that the citizens comprised only a small proportion of the total population. Although figures for the number of Spartiates between the ages of 21 and 50 and *perioikoi* ("dwellers round") in the army are given, their proportion to the total number of Spartiates or *perioikoi* can only be conjectured. The number of helots is still less well known, except that they were relatively more numerous in proportion to the free population than were serfs in any other state. At all events we know that at some time Sparta introduced severe penalties for celibacy as well as rewards for child-bearing. It was seriously concerned even about the loss of the 124 Spartiates trapped by the Athenians on the island of Sphacteria in 424 BC. By the time of its debacle at Leuctra in 371 BC it had only 1000 of these; whereas Aristotle calculated that its territory could have maintained 30,000 infantry and 1500 cavalry. An unwillingness to breed because of a decadent obsession with personal wealth seemed to be the chief cause of the population decline. Nor was there, as in Athens, a strong religious cult of ancestors to motivate perpetuation of the family.

The citizen population of Argos and Boeotia during the 4th century BC may not have been dissimilar to that of Athens, to judge from their military strength, but they probably had fewer resident aliens and slaves. Corinth, which in the 5th and 4th centuries BC had less than half the hoplites of Athens, may have had half as many inhabitants as Athens, if not fewer. The poor and mountainous country of Arcadia produced many emigrants; and yet it had 6000–7000 hoplites in the 4th and 3rd centuries BC. By comparison with Attica this would mean a citizen population of about 80,000–90,000. On the other hand, the prosperous Greek colonies of Sicily and Italy were densely populated and, despite the lack of evidence, we may assume that the size of their populations exceeded that of virtually every state in mainland Greece. To take just one example, according to Diodorus Siculus (3. 9) the wealthy and prosperous city of Sybaris had 300,000 inhabitants.

Xirotiris, N.I., “The Indo-Europeans in Greece: An Anthropological Approach to the

Demons and Spirits

Our word "demon" comes from the ancient Greek *daimon*, from the verb *daiein*, "to distribute". In the Homeric and Classical periods *daimon* could be used as a synonym of *theos* to mean simply "god". More frequently, however, *daimon* referred to "divine power" in the abstract as opposed to the personified deity denoted by *theos*. In a wide range of Classical sources *daimon* could mean "the power controlling the destiny of individuals". It carried overtones of "a portion" (*moira*) in the sense of "fate". A *daimon* was both the distributor of destinies and the destiny itself.

In contrast to the Olympian gods, the *daimones* were not honoured by any cult or shrine within the polis. Nor were they represented in myth, drama, vase painting, or sculpture. They were a nameless, ill-defined plurality of supernatural beings, yet this semantic vagueness suited them for new applications in the course of time, especially in the area of psychology.

A productive set of meanings for *daimon* derived from Hesiod, according to whose *Works and Days* the souls of men from the golden age became good *daimones* who watched over and protected mortal men. In the *Timaeus* Plato allocated them to the *aither* (upper air), above the *aer* (lower air) where heroes and departed souls resided. Souls and *daimones* alike were physically composed of *aither*, a mysterious fifth element (*quinta essentia*). The *daimones'* position between heroes and gods was not, however, stable, and Plato elsewhere equated all fallen soldiers with *daimones*, while during the Hellenistic period any deceased person could be called a *daimon*. In this sense *daimon* came close to the ideas of soul (*psyche*) and spirit (*pneuma*).

Daimones also had associations with human emotions, beginning with the *Symposium*, where Diotima introduced Eros as a *daimon*. Plato furthermore (*Timaeus*, 90c) considered that humans should pursue learning and true thoughts in order to achieve "happiness" (*eudaimonia*) – a state in which the good internal *daimon* conies to the fore. It was Plato's pupil Xenocrates who conceptualized demons as dark, lustful forces, thereby initiating the shift of the *daimones* from elements of a scientific, philosophical cosmology to elements of a moral one. This would be a slow and uneven transition lasting centuries and not definitively finishing until the rise of Christianity. During the Hellenistic period *daimones* continued to be treated as intermediaries. For example, it was thought that they sent dreams. In Neoplatonic magic, as represented by the Chaldaean Oracles, the

daimones could be addressed and their aid enlisted through elaborate rituals involving the spinning of a top, or *iunx*. Alternatively, messages enlisting demonic help against an enemy could be written on lead tablets and buried along with the dead. Or the *daimones* could be appealed to, or controlled by resort to more powerful gods, through elaborate spells recorded on magical papyri.

The Christianization of the Greek-speaking world did much to polarize the demons as exclusively evil spirits located on, or in, the earth. The already many-stranded traditional conception of *daimones* was reorientated by the Judaeo-Christian story of Satan who, in an act of hubristic jealousy, attempted to place his throne higher than God's. In recompense he was cast down from the heavens, along with his conspiring angels who became demons – a word that, through phonological changes in the language, was now pronounced *demon*es (as indeed it still is in modern Greek). Demons in the Christian world were unequivocally evil, associated with matter, sin, corruption, and the body, as opposed to the values of Christian purity, restraint, and spirituality overseen by God and Christ.

Demosthenes 384 –322_{BC}

Orator

Demosthenes was the son of a wealthy Athenian manufacturer of swords and cutlery. His father died when he was 7 years of age, leaving him under the control of three guardians who embezzled most of the inheritance. After studying rhetoric with Isaeus, Demosthenes began a series of prosecutions against his former guardians and recovered some of the lost money (364 BC), but more significantly, gained a reputation as a speech writer. He also taught rhetoric, but he had grander ambitions and overcame a speech impediment by practising declamation with pebbles in his mouth and shouting above the noise of the waves at Phalerum.

Demosthenes' political career began in 355 BC, when he was commissioned to write *Against Androtion* for a political trial. In the early period he may have opposed the policy of Aristophon, who was advocating war with Persia, and he attacked Eubulus in *On the Syntaxis* (353/52 BC). By 351 BC he recognized the dangers posed by Philip II and delivered the unsuccessful *First Philippic*, followed by the three *Olynthiacs* (349 BC). In the third of these Demosthenes alludes critically to Eubulus' policies, which in 348 BC led to costly Athenian intervention in Euboea. In the same year he became involved in litigation against Meidias, a leading supporter of Eubulus, who slapped Demosthenes' face at the Dionysia. The *Against Meidias*, however, was never actually delivered, since the two reached an out-of-court settlement.

In 348 BC Demosthenes successfully defended Philocrates, when he was prosecuted for proposing negotiations with Philip, but soon afterwards Olynthus fell, and Demosthenes helped to secure the Peace of Philocrates (346 BC). Aeschines attacked Demosthenes for the poor part he played in the negotiations, and it was Aeschines who championed the treaty before the assembly, which knew that Philip was already threatening Phocis. It is unclear what Demosthenes tried to propose at this meeting before being shouted down, but he subsequently worked to undermine the peace, gathering supporters to strengthen his anti-Macedonian position, including Hyperides and Lycurgus. He was also plotting his revenge on Aeschines, claiming that he had been bribed by Philip, but his attack on him through the agency of Timarchus was a failure. This was, however, only a temporary setback. In 344 BC, with Philip interfering in Thessaly and rumours circulating about his proposed intervention in the Peloponnese, Demosthenes persuaded the assembly not to renew the peace by his *Second Philippic*. Hyperides successfully prosecuted Philocrates (343 BC), while Demosthenes prosecuted Aeschines with *On the False Embassy*. Demosthenes' case was weak, but despite the support of Eubulus and the prominent general Phocion Aeschines was only narrowly acquitted.

In 341/42 BC Philip turned his attention to the Chersonese, threatening Athens' corn supply from the Black Sea, and his supporters in Athens demanded the recall of Diopceithes from Thrace. Demosthenes supported Diopceithes in *On the Chersonese* and the *Third Philippic*, one of his finest speeches, in which he spelled out Philip's designs on Greece and urged the Athenians to defend the Chersonese and Byzantium. An alliance was formed with Byzantium (341/40 BC), and although Philip seized Athens' corn fleet, his advance on Byzantium was checked. Demosthenes was now supreme in Athens and had the allocation of surplus revenues to the Theoric Fund suspended, but could not prevent Aeschines fomenting a Sacred War in 339 BC. Philip marched into Phocis and took Elatea, and Demosthenes persuaded the Athenians to make an alliance with their old enemy, Thebes. The allies met Philip at Chaeronea, but were crushed (338 BC).

Demosthenes continued to work energetically on the city's behalf after the Macedonian conquest and delivered the public Funeral Oration of 338 BC. In 337/36 BC he was theoric commissioner, and Ctesiphon proposed that he be honoured with a gold crown at the Great Dionysia for his services to Athens. Aeschines immediately indicted Ctesiphon for making an illegal proposal, but let the case drop because the political climate in Athens changed with the death of Philip. After Alexander had reestablished Macedonian control and defeated Persia, Aeschines resumed his attack (330 BC), blaming Athens' troubles on Demosthenes, but Demosthenes' masterpiece, *On the Crown*, easily won the day. He remained a prominent figure in Athens until the Harpalus affair (324 BC). Alexander's treasurer Harpalus arrived in Athens with a vast sum of money, and Demosthenes proposed that he be imprisoned and the money stored on the Acropolis. Harpalus escaped, and it was discovered that some of the money was missing. The Areopagus cited Demosthenes, who was prosecuted by Dinarchus and Hyperides; fined 50 talents, he retired into exile. He returned to Athens after Alexander's death (323 BC) and advocated renewed resistance to Macedon in the Lamian War, but the Greeks were defeated at Crannon by Antipater (322 BC). Demosthenes, Hyperides, and their supporters fled; Demades proposed that they be sentenced to death, and Demosthenes committed suicide on the island of Calauria.

Judgements of Demosthenes' leadership have inevitably been affected by the brilliance of his speeches, and his championing of liberty tends to be seen in too simple a contrast to the servile acceptance of Macedonian rule by his opponents, whom he constantly accused of being bribed. In truth, other politicians were probably making proposals that stood a greater chance of success in

maintaining Athens' freedom, particularly the uniting of the Greek states in a common peace. Athens alone lacked the resources to resist Philip in the way Demosthenes advocated, and his policy of fighting a war in the north was not popular with other Greek states, who realized that a successful outcome would result primarily in the greater glory of Athens. But this is not to deny Demosthenes' stature as one of Athens' greatest leaders.

From the literary point of view Demosthenes has been recognized by both ancient and modern critics as the best of the Attic orators. One of his outstanding qualities was the ability to vary his style to suit the occasion of the speech. There is some evidence that the speeches, always carefully prepared, were revised for publication, but Demosthenes creates an impression of spontaneity by mixing long periods with shorter, simpler sentences. He tended to avoid hiatus and also runs of more than two short syllables. There is disagreement over how far this was a conscious rather than instinctive practice, but its effect is one of solemnity and dignity. Demosthenes writes in pure Attic Greek, and in narrative passages he regularly employs a plain style of writing; but elsewhere his sentences can be quite complex. He uses repetition, bold metaphors, and colloquialisms, varies his tone, and indulges in the vulgar personal abuse that was popular in his day. It was the combination of simplicity and complexity into a "middle" style that the Augustan critic Dionysius of Halicarnassus regarded as producing the most effective oratory.

The Demosthenic corpus comprises 60 speeches, an *Erotic Essay*, a collection of 56 proems (prefaces, written as models for imitation by his pupils), and six letters; but a number of the private orations, the *Funeral Speech*, and the *Erotic Essay* are spurious. His earliest forensic speech, *Against Aphobus I*, already displays the hallmarks of Demosthenic oratory, with its forcefulness and variety, and a somewhat imperious ethos. Demosthenes continued writing speeches for wealthy clients throughout his life, though he did not appear in person in private cases after the late 350s BC but even private suits might have their political side. He composed *Against Stephanus 1* (349 BC) for Apollodorus, when he was prosecuting Stephanus for perjury on behalf of Apollodorus' stepfather, the banker Phormio. He attacks Phormio bitterly, yet at the original trial in 350 BC he had written *For Phormio*, in which he bitterly attacked Apollodorus. Demosthenes probably changed sides because Apollodorus had begun, like Demosthenes, to advocate the use of the Theoric Fund to finance the struggle against Philip, but centuries later Plutarch criticized his morality.

Demosthenes' forensic speeches cover a wide range of subjects in both private and public cases, and demonstrate a talent for character

portrayal and logical argument. One of his best private orations is *Against Conon*, an action for battery brought by Ariston. In a vivid narrative Ariston tells how he first met Conon's permanently drunk sons and describes the fight in which he was nearly beaten to death, though the decent youth cannot repeat the abusive language used by his brutal attackers. Demosthenes is an unashamed patriot, and national character is the underlying theme of many of his most famous speeches, both political and judicial. In *On the Crown* he gives an extended account of his public services and conceals the fact that his policy had failed at Chaeronea by emphasizing Athens' greatness – and his own role as the city's greatest champion.

Demosthenes' patriotic stance against Philip and his judicial defeat of Aeschines laid the foundations for his reputation in the later Classical world and beyond. A full-length biography was composed in the 2nd century AD by Plutarch, who paired Demosthenes with Cicero in his *Parallel Lives*; an extensive life is found in the pseudo-Plutarchan *Lives of the Ten Orators* of the same period; while briefer notices were written by Libanius and Zosimus (one of various scholars of that name living in the 5th–6th centuries AD). In the 9th century Photios wrote a biography based on pseudo-Plutarch, and further biographical details may be found in the *Suda*. This material is generally favourable, and St Nicholas of Myra regarded Demosthenes as the embodiment of virtue, in stark comparison with Aeschines. But a hostile tradition is represented by Tzetzes, who perversely makes Demosthenes rather than Aeschines the venal politician. Theodore Metochites (1270–1332) similarly compared Demosthenes in part unfavourably to Aelius Aristides, though he regards Demosthenes as the greater rhetorician. Finally, a statue of Demosthenes was placed in the Baths of Zeuxippos in Constantinople and described by the 5th/6th-century poet Christodorus of Coptus.

Demosthenes' speeches were, in the eyes of most critics, the supreme models for imitation. Already in the 2nd century AD they were being drawn on extensively by rhetoricians such as Hermogenes, who calls Demosthenes "The Orator". Hermogenes' use of Demosthenes is highly significant, since later rhetoricians were in turn deeply influenced by him. Tiberius wrote *On the Figures of Demosthenes* in the late 3rd or early 4th century AD; Epiphanius the Syrian, a candidate for the chair of rhetoric in Athens after the death of Julian of Caesarea (c. AD 330), wrote a commentary on Demosthenes; and, most famously, in the 4th-century AD Libanius of Antioch wrote *Hypotheses* to the speeches in Constantinople. The *Suda* attributes another commentary to Zosimus. In the 6th century AD Choricus used Demosthenes as a model for his speeches; the curriculum in the schools of rhetoric in this period included the Attic orators, especially Demosthenes, as well

as Isocrates and Aeschines, and extensive use of Demosthenes is attested by the numerous scholia – and by the abuse of Demosthenes, along with Homer, Plato, and Aratus, in the hymns of Romanos. The earliest manuscripts of Demosthenes are datable to the 9th and 10th centuries AD, when the revival of interest in the Classics led to further activity by scholiasts. Numerous papyri have also been recovered from Byzantine Egypt (they indicate the position of Demosthenes alongside Homer, Euripides, and Menander as one of the central Classical authors), and Demosthenes' position as the greatest Classical Greek orator and the best source of suitable material for quotations was maintained throughout the Byzantine period to the 15th century. In the 11th century Michael Psellos compared Demosthenes with Gregory of Nazianzus, who synthesized Classical rhetoric and Christianity; while in the 12th century Gregory of Corinth recommended Demosthenes among his models for deliberative and judicial oratory. His rousing *Philippics* in particular have ever since been seized on by politicians: during the War of Independence the *Appeal to the French People* recalled the place of Demosthenes in Greece's glorious past, while in 1827 Lord Cochrane quoted the *First Philippic* to Kolokotronis in an exhortation to unity.

Biography

Born into a landowning Athenian family in 384 BC, Demosthenes studied rhetoric under Isaeus and became a professional speech writer. His political career began in 355 BC when he initially advocated peace, against the policy of Aristophon. By 351 BC he recognized the threat to Greece posed by Philip II of Macedon and devoted the rest of his career to warning against it. Despite the defeat at Chaeronea (338 BC) Demosthenes remained in office until 324 BC when he was charged with corruption. In 321 BC he fled and committed suicide on the island of Calauria.

Dialectic

Dialectic is variously a practice, a method, and a science in Greek philosophy. The basic precept of dialect is based on conversation – and perhaps disputation – between at least two distinct parties. Dialectic lies at the very heart of all Greek philosophy and represents one of its most characteristic contributions to the sum of human thought.

The modern English word is a near-transliteration of the Greek word *dialektike*, meaning “the art or skill of discussing”. Conversational encounters, as the ancient Greeks knew, may consist of unproductive pleasantries, or be hostile confrontations, or serve as mutually productive exchanges between two minds concentrating on the same issue from different initial perspectives. Serious dialectic concerns the latter; but Greek philosophers realized that without proper regulation the exercise could degenerate into one of the other forms of encounter. The more pressing danger came from the tendency to ill-disciplined disputation, which was given the pejorative title of “eristic”, or contentious argument.

We learn about dialectic mainly from the practice of Plato’s dialogues, where there occur specimen dialectical exchanges interspersed with some comments on sound and unsound method, and more thoroughly from Aristotle’s *Topics* and *Sophistici Elenchi*, which describe the practice of dialectic and set out his thoughts on its philosophical purpose and value. Dialectic continued to be studied after Aristotle, particularly by such early Stoic logicians as Chrysippus. However, by this stage dialectic had come to be included in the study of logic, with specific reference to the more pragmatic aspects of the theory of argument; there is little evidence of the actual practice of dialectic from this period. On the other hand, philosophers after Aristotle continued to exhibit a dialectical style in their handling of problems; and to that extent dialectic is an enduring feature of all Greek philosophy, not merely a dominant aspect of its seminal period in the 5th and 4th centuries BC.

In a dialectical exchange there is a clear division of function between two participants – the questioner and the answerer. An issue is proposed: for example, *Is virtue teachable or not?* or *Should we return*

to people what is their due or not? The answerer chooses one of the two possible responses, and thereafter answers questions which are designed to lead him to say something incompatible with his original answer. The questioner holds the initiative, but the answerer is at liberty to respond at any stage as he sees fit. Rational insight, and even logical dexterity, are needed if the questioner is to elicit an answer which fails to cohere with the answerer's original response.

Dialectic hinges on winning or losing a contest, and its purpose is to advance the pursuit of truth. These aims were articulated as the exercise progressed, and a sense of their significance always imposed discipline and regulation on its conduct. For example, questions must be clear cut; they must not leave open a plurality of responses beyond a straightforward yes or no. Measures must be taken to avoid or expose ambiguity, whether in a single word or in a larger unit of language; otherwise the value of any particular dialectical response will be uncertain. By these means, those who practised and theorized about dialectical exercises came to assist the creation and development of logic. But all such dialectical rules or sanctions were themselves subject to appraisal and acceptance or rejection within the context of the particular philosophical encounter. Everything was subject to consideration, save perhaps for the very freedom of enquiry which the exercise presupposed.

Plato had a strong insight into the potential of dialectic for the advancement of understanding. He understood that the open-ended, autonomous nature of the exercise made it an ideal method for securing knowledge which was based on deep and sustained conviction. The practised dialectician is able to defend his insights against every kind of attack; and how could there be a better basis than this for anyone to support a claim to have genuine knowledge?

Yet Plato was simultaneously developing stringent criteria defining what was to count as knowledge – for example, that it be not subject to revision, and that it be based on rational reflection. Thus he proposed that dialectic should be a science rather than merely a method. This revision was secured by placing dialectical method on a foundationalist basis; effective practice of the method was to be dependent on a grasp of the truth conveyed by an intuition of the nature of goodness. By using value as the fundamental concept of the science, Plato preserved a Socratic insight into the pervasive philosophical significance of matters of value, whatever particular topic might be under consideration. Nevertheless, the progression of dialectic from a method to a science transmutes an essentially open-ended sceptical stance into a commitment to the pursuit of certainty and truth.

Aristotle sought to restore dialectic to its earlier role as a training

exercise and at the same time to establish its connection with the distinct spheres of science and philosophy. The philosophical value of dialectic resides both in its capacity for training and, above all, in its role in the examination of the scientific axioms. Dialectic can help those who wish to discover first principles; it provides an essential preliminary phase to the operation of axiomatic scientific demonstration. Scientists then take over the task of demonstrating the deductive consequences of these axioms.

Aristotle's practice when engaged in philosophy diverges somewhat from this official position. He begins almost every discussion – both of general topics and of detailed problems within them – with a review of previous views on the given question and an elaboration of the difficulties which are generated if we try to combine them. However, dialectical method dominates the entire discussion of these problems. It is not a preliminary, which will give place to a less tentative phase of enquiry in the subsequent examination. Instead, the teasing out of problems forms the very substance of Aristotelian philosophy, and in this sense philosophy is dialectical through and through.

In Aristotle the theory of dialectic is linked to the studies of logic and of fallacies. Many of the concepts of dialectic – such as argument, deduction, premise, and reduction – are also used in his theory of the syllogism. But logic is independent of the context of investigation, while dialectic is not. The study of fallacies, which Aristotle inaugurates in *Sophistici Elenchi*, is unintelligible without reference to dialectic. For example, the fallacies of many questions and begging the question arise essentially in a question-and-answer context, as their names make clear.

Many philosophers after the ancient Greeks have assigned philosophical significance to dialectic; perhaps the most notable in this company are Kant, Hegel, and Marx. Their very different interpretations and valuations of dialectic all owe much to the accounts of the matter in Plato and Aristotle. Moreover, the cut and thrust of dialectical method is still very apparent in the problem-oriented style of modern analytical philosophy. The original inspiration for this very fertile philosophical idea is firmly rooted in 5th- and 4th-century Greek thought, and it repays study in that context.

Dialects

Those Indo-Europeans who arrived in the Balkan peninsula in the late 3rd or early 2nd millennium BC – whom we may call the Proto-Greeks – were themselves members of a dialectal subgroup of the Indo-European family of languages and peoples. Common linguistic innovations suggest that the ancestors of the Greeks, Indo-Iranians, and Armenians spoke related varieties of late Indo-European. We would expect that even among that body of Proto-Greeks penetrating into the Balkans there was dialectal heterogeneity (if only on the sociological level), since all speech communities are linguistically heterogeneous. Beyond this, however, documentary evidence clearly reveals that by the mid- to late 2nd millennium BC, and much more so in the 1st millennium BC, the Greek language was characterized by distinct dialectal forms.

Before Michael Ventris's decipherment of the Linear B script in the 1950s, scholars had long been classifying the already known dialects of ancient Greek into several groups. With the decipherment of the Mycenaean tablets, yet another dialect was revealed – one that showed close similarities to certain of the post-Mycenaean dialects, though not complete identity with any. As analysis of the Mycenaean texts progressed, an awareness developed of the existence of not one, but two dialects preserved in the Linear B corpus (see Risch 1966; Nagy 1968; Woodard 1986). Moreover, folding the Mycenaean evidence into the analysis of Greek dialectology of the 1st millennium BC gave rise to speculation that no fewer than four distinct dialects of Greek must have existed in the Mycenaean era (see Cowgill 1966).

Those two attested varieties of Mycenaean Greek have been commonly dubbed “Normal Mycenaean” (since it is the more frequently occurring dialect) and “Special Mycenaean”. There are at least four linguistic differences (or isoglosses) which distinguish the two dialects. Normal Mycenaean is characterized by each of the following features: (1) the third declension dative singular ending *-ei*; (2) the development of Proto-Indo-European syllabic nasals into the vowel *o*, in the vicinity of a labial consonant; (3) the change of **e* to *i*, also in the environment of a labial consonant; (4) the “assibilation” of inherited **ti* to *si*. Special Mycenaean, on the other hand, shows a distinct set of developments: (1) the corresponding dative ending is *-i*; (2) syllabic nasals become *a*; (3) **e* is preserved; (4) also preserved is

the sequence **ti*. Of the four dialect features characterizing Normal Mycenaean, only one is attested among the known Greek dialects of the 1st millennium BC (the change of **ti* to *si*); otherwise it is the Special Mycenaean isoglosses alone that have survived.

The Greek dialects of the 1st millennium BC are divided into five major groups: Attic-Ionic, Arcado-Cypriot, Aeolic, Doric, and Northwest Greek. Of these, the most familiar to modern students of Greek is Attic-Ionic, consisting of the closely related dialects of Athens and surrounding Attica, and of the Ionians of Anatolia (East Ionic), of the Cyclades (Central Ionic), and of the region of Euboea (West Ionic). Distinct linguistic features of the Attic-Ionic dialect include the change of **ā* to *toē* (the vowel of *eta*), except after *e*, *i* and *r* in Attic; and the process of “quantitative metathesis”, whereby certain sequences of *long vowel* + *short vowel* become *short vowel* + *long vowel* (e.g. *ēo* gives *eō*).

Of the Greek dialects of the 1st millennium BC, the one most closely related to the language of the Mycenaean Greeks is Arcado-Cypriot. Though far-flung geographically – its speakers ranging from the central Peloponnese to the island of Cyprus in the eastern Mediterranean – the dialect is internally quite homogeneous. Its uniformity is plainly the consequence of common ancestry: Mycenaean peoples who, on the one hand, remained or settled in mountainous Arcadia and who, on the other, came *asémigrés* to Cyprus with the eclipse of the Mycenaean civilization of Greece. The Greek language of Pamphylia in southern Anatolia shows some similarity to this same dialect group. Arcado-Cypriot is characterized by a peculiar development of early Greek labiovelar consonants when they occur before the vowel *i*. Thus, Proto-Greek **kwis* “anyone” gives Cypriot *sis* (*tis* in other dialects); Arcadian writes the sound with a special symbol (a form of *san*) – *И*.

The Aeolic dialect group, like the Ionic, consists of members separated by the Aegean Sea. Lesbian is the dialect of the Aeolian islands and the Aeolian region of Anatolia. Boeotian and Thessalian were spoken in Boeotia and Thessaly respectively; the latter dialect itself is composed of two distinct varieties – Pelasgiotis and Thessaliotis. The Aeolic dialects are characterized by a bilabial development of the labiovelar consonants occurring before *e*-vowels; thus Proto-Greek **penkwe* “five” gives Aeolic *pempe* (cf. Attic *pente*, with the common dental reflex *t*). Within Thessalian, Pelasgiotis and Thessaliotis exhibit two salient differences: (1) the genitive singular of the second declension is *-oi* for the former and *-M* or *-ou* for the latter; (2) the present infinitive of the *omega*-conjugation is formed with *-emen* in Pelasgiotis, but with *-en* or *-ein* in Thessaliotis.

Doric is that group showing the greatest number of constituent

dialects. Distinct varieties from the Peloponnese include Laconian, Messenian, Argolic, Sicyonian, and Corinthian. From the isthmus of Corinth comes Megarian. Greek islands attesting distinct Doric dialects include Crete, Thera, Cos, and Rhodes (with Doric also spoken on the associated Anatolian coast). The various Doric dialects show numerous unique linguistic features as well as features common to both Doric and Northwest Greek, discussed immediately below. Cretan, the best attested of the Doric dialects, shows several specific dialect characteristics, such as a particular propensity for consonant assimilation.

The remaining dialect group, Northwest Greek, is closely related to Doric. Dialects of this type are attested from Phocis, Locris, and Elis. Characteristic of both Northwest Greek and Doric is the preservation of the sequence **ti* (as in Special Mycenaean), without the development to *si* found in other dialects. Elean is interesting in displaying the shift of longē (*eta*) to *ā* – the very reverse of that vowel change distinctive to Attic-Ionic (see above). Also common to Northwest Greek and Doric (Cretan excepted) are the nominative plural articles *toi* (masculine) and *tai* (feminine), rather than the *hoi* and *hai* of other dialects.

Modern scholars have conventionally divided these various dialects into two major groups, East Greek and West Greek, implying some sort of bifurcation in evolutionary descent from Proto-Greek. East Greek subsumes Attic-Ionic, Arcado-Cypriot, Mycenaean, and Aeolic. West Greek is then made up of those two dialects we have already seen to be closely related, Doric and Northwest Greek. The adequacy of this interpretation was, however, called into question by Ernst Risch in 1955 in a careful and probing re-examination of the dialect features that distinguish and bind the regional dialects (“Die Gliederung der griechischen Dialekte in neuer Sicht”, reprinted in Kirk, 1964). In summary, Risch argued that the relative antiquity of the various dialect features (isoglosses) must be taken into consideration when determining genetic relationships among the dialects. Those features that place Aeolic within East Greek are relatively late in origin and are characteristic of Lesbian, not Thessalian and Boeotian. Contending that Lesbian acquired these innovating characteristics in conjunction with their development in neighbouring East Ionic, Risch realigned Aeolic, placing it with Doric and Northwest Greek. The resulting dialect structure is then one of South Greek (Attic-Ionic, Arcado-Cypriot, Mycenaean) versus North Greek (Aeolic, Doric, Northwest Greek). The proper genetic grouping of the ancient Greek dialects awaits resolution.

The literary language of pre-Classical and Classical Greek, in its various forms, likewise displays linguistic features that are

characteristic of the geographic dialects of the 1st millennium BC. However, the literary dialects are for the most part linguistically artificial. That is to say, they are contrived from elements of different regional dialects and are not themselves identical to any single dialect of spoken Greek – the products of local literary expression that have spread beyond their regional boundaries and have been fused by adapting literary artists. The language of Homer and Greek epic consists chiefly of East Ionic and Aeolic elements, along with bits of Arcado-Cypriot vocabulary. Lyric poetry is composed in several linguistic forms. The Lesbian poets Alcaeus and Sappho write in their Aeolic dialect, but preserve elements of epic language. Archilochus, Solon, and others write in epic dialect, tempered with their own native Greek dialects. The language of choral lyric is fundamentally Doric, though generally unlike any single regional Doric dialect, mixed with Aeolic and epic. Tragedy's dialect is Attic, with elements of Doric, Aeolic, and epic woven in; choral passages are more heavily Doricized (achieved often by the use of long *ā* where Attic has *ēta*). Herodotus and earlier prose authors wrote in Ionic. By the end of the 5th century BC, Attic had become the language of prose, though marked Atticisms (such as *-tt-* where Ionic has *-ss-*) tended to be avoided for a time. With the rise of Athenian political prominence, Attic was the widely used prestige dialect throughout the Greek-speaking world; it remains the dialect of the 4th-century prose authors.

Philip II, a Macedonian, chose to install Attic Greek as the official language of his realm. Greek culture and the Attic dialect trailed in the conquering footsteps of Philip's Greek-educated son, Alexander; Attic Greek thus became the *lingua franca* of Alexander's vast empire. The particular form which this *lingua franca* developed is that of a modified Attic, usually called Attic Koine or simply Koine Greek. This is the language of the Greek New Testament and of the Egyptian papyri.

Attic Koine displaced regional dialects within Greece, with the result that almost all modern Greek dialects appear to trace their roots to Attic. The notable exception is the dialect of Tsakonian. In response to Slavic incursions into the Peloponnese in the 6th and 7th centuries AD, the Greeks of Laconia are reported to have fled into the rugged mountains of Tsakonia. The modern dialect that developed in this remote area appears perhaps to be a descendant of Laconian, or at least of some form of Peloponnesian Doric which had resisted the influx of Attic Koine.

Dio Cocceianus c.^{AD} 40–112

Orator and philosopher

The life and career of Dio Cocceianus not only form the background to his literary work, but also provide valuable insights into the situation of the Greeks under Roman rule during the so-called “high” empire (1st and 2nd centuries ^{AD}). Born into an influential family in Prusa in the province of Bithynia (northeastern Asia Minor), Dio first attained a prominent position as a well-educated Greek intellectual in Rome under the Flavian emperors. When, however, he (apparently) became implicated in the disgrace of a prominent Roman, Flavius Sabinus, under Domitian, he was banned from Rome and his home province; suddenly destitute, he took up the life of a wandering philosopher with Cynic affinities, roaming as far as the very outposts of Greek culture on the northern shore of the Black Sea. With the accession of the emperor Nerva (and his adoptive son Trajan) in ^{AD} 96, Dio was able to return to Prusa, where he regained his family’s leading position and apparently played a major (though not uncontroversial) role in local and provincial politics until his death. Most of Dio’s so-called *Bithynian Speeches* were written during this time and give valuable insights into the numerous rivalries not only within Greek provincial cities but also among them, and into their relations with Roman authorities.

Dio did not confine his public appearances to his home province, but also exhorted a number of other cities in Asia Minor (and even Alexandria in Egypt) to remain true to their former ideals and to keep the peace with each other and within themselves. He also addressed four speeches *On Kingship* to the emperor Trajan, with whom he developed a relationship marked by mutual respect and friendship. Apart from such speechmaking, Dio’s oeuvre comprises an astonishing variety of themes and literary forms: essays on moral themes (*On Servitude*, *On Liberty*, *On Fate*, *On Philosophy*, etc.); lively dialogues that often feature the colourful figure of Diogenes the Cynic; treatises on literary subjects (e.g. a comparative study of the three Philoctetes plays written by the great Classical tragedians); a guide to suitable literary models for rhetorical imitation; and even writings on art (the *Olympic Discourse* is centred on Phidias’ magnificent statue of Zeus at Olympia and the religious awe it conveyed). An especially entertaining part of this production consisted in so-called “sophistic” display rhetoric and treatments of paradoxical themes (the *Praise of the Parrot* is lost, and of the *Praise of Hair* some excerpts were incorporated by Synesius in his *Praise of Baldness*); an impressive tour de force is the *Trojan Discourse To Show that Troy Was Not Captured*,

directed against the monumental work of Homer himself (but not really meant seriously, because Dio in many other essays quite happily accepts Homer as a model and teacher). Not all of this enormous production (the transmitted corpus contains 80 items, including two false attributions; but a number of works have been lost, some of which are still cited by their title in the late 10th-century *Suda* lexicon) can be securely dated. A number of works certainly go back to the time before Dio's exile, but the greater part was probably written afterwards (in exile he collected material for a now lost *Getica*, a historical description of this Scythian people).

The wide range of Dio's literary work prompted a lively debate about his exact position within the cultural currents of his times: was he to be reckoned more as a philosopher or as a rhetorician? This debate started soon after his death, and its long duration was one of the marks of his continuing influence: the philosopher Epictetus judged Dio to be only a rhetorician, more intent on form than on content, but Dio's pupil Favor-inus regarded him – more positively – as a guiding moral authority even after his death, even seeing him in dreams. Lucian – in *De Morte Peregrini* – placed him beside the philosophers Musonius and Epictetus himself, both of whom suffered exile for their persuasions. In the 3rd century AD the “historian of sophists” Philostratus gave two pictures of Dio not wholly consistent with each other: in his *Life of Apollonius* he made Dio participate in a momentous (but fictional) “Constitutional Debate” with Euphrates of Tyre and Apollo-nius of Tyana, in the presence of the future emperor Vespasian; in the *Lives of the Sophists* he characterized him as a philosopher-sophist, whose philosophical disposition was clothed in the rhetorical abilities of a Sophist. In the latter part of the 4th century the philosopher-rhetor Themistius mentions Dio within a series of philosopher-advisers of Roman emperors; in the *Lives of the Philosophers and Sophists* of Eunapius, he is similarly ranked as a philosopher. A few years later, a more discriminating and in later times very influential picture of Dio was outlined by the Neoplatonist (and later bishop) Synesius of Cyrene: according to him, Dio set out as a clear-cut sophist, who even wrote strident tracts against philosophy, and only turned philosopher during and after his exile, so that his writings should be carefully divided into pre- and post-exile productions.

The other enduring aspect of Dio's influence was the style and content of his various works which provided stimulants and stylistic models until the end of Byzantium. Already in Lucian's writings many features of Dio's work reappear. In the 3rd century AD Menander of Laodicea (who was the first to record Dio's later canonical name “Chrysostomus”) cites Dio as an example of an easy-running and

graceful style, and as such he continues to be read. Our first witness for the importance of Dio in Byzantine times is – as so often – Photios, who in a detailed account in his *Bibliotheca* (Codex 209) not only discusses Dio's life and style of writing but also gives an item-by-item outline of the corpus of his works as it was extant in his day (this, incidentally, is identical with what is still preserved). Soon after, Arethas of Caesarea (though he strangely misplaced Dio by making him a contemporary of Nero and Vespasian and even more strangely explained his surname "Chrysostomus" as a euphemism for "stinking-mouth") not only ensured the ongoing transmission of Dio's works, but also added numerous and rich explanatory notes to the manuscript that was produced on his initiative. Arethas especially commented on those writings of Dio that were to be at the centre of the Byzantines' interests for centuries to come: the speeches *On Kingship*, the *Euboean Discourse* (a charming picture of the simple rural life on Euboea combined with moral advice for the urban poor), the *Borysthenitic Discourse* (a vivid description of Dio's visit to Olbia on the Black Sea and the cosmological myth he told there), and the *Trojan Discourse*. In the 11th century John Mavropous wrote a speech for the emperor Constantine IX that drew on Dio's *Borystheniticus* and kingship speeches; the latter also provided a model for the address to Constantine X written by Theophylact, archbishop of Ochrid. In the 12th century Dio's *Troicus* aroused the ire of John Tzetzes, who severely condemned every attempt *not* to take Homer's *Iliad* allegorically. Even Eustathios, the indefatigable commentator on the Homeric poems, seems to have taken Dio's anti-Homeric tour de force seriously. The last major witness to the Byzantines' unflagging interest in Dio is the essay on him by Theodore Metochites (1270–1332), wherein he subtly compares him to Synesius, Dio's most prominent admirer in late antiquity, and stresses the artfulness of his seemingly simple style. Because, however, even this simplicity moved within the confines of a long since obsolete literary language (the Attic of the 4th century BC), Dio's literary influence ended with the Byzantine empire.

HEINZ-GÜNTHER NESSELRATH

Biography

Born c.AD 40 at Prusa, Dio moved to Rome as a rhetorician, but was banished for political intrigue and spent many years wandering about the Greek-speaking world. In 96 he was able to return to Prusa where he played a part in local politics until his death c.112. His surviving works, a total of 78, include speeches, essays, and dialogues on philosophical as well as rhetorical topics.

Diodorus Siculus

Historian of the 1st century BC

One seldom encounters a figure so wrapped in the Greek tradition as Diodorus Siculus. Neglected by his contemporaries and often discounted by modern scholars, his work preserves priceless portions of Greek history and historiography. His *Library of History* claims to trace the history of the entire world from creation up to Diodorus' own days, formally ending with Caesar's consulate in 60 BC. Of Diodorus himself we know little, except for what we can glean from this work, which he claims was 30 years in the making. He was a native of Agyrium in Sicily, visited Egypt around 60–56 BC, and had some familiarity with Latin and Rome. The last event he mentions seems to be from 36 BC. Apart from ethnographic excursions in the early books, Diodorus' focus is almost entirely on Greece, Rome, and Sicily. Of the *Library's* 40 books only 15 survive intact (1–5, 11–20), as well as substantial fragments from the remaining 25. These remains form the largest corpus of Greek history to survive from antiquity to our own day.

Diodorus' *Library* provides an intriguing glimpse into many varieties of Greek historical writings that would otherwise be largely unknown to us. The *Library* incorporates – relatively faithfully and relatively uncritically – a vast amount of otherwise lost literature in abridged form. After a brief account of the creation of the world, he gives an ethnography of Egypt, mostly from Hecataeus of Abdera; a legendary history of Mesopotamia, from Ctesias; and an account of India from Megasthenes. He then gives copious summaries of myths, canonical and deliberately outrageous, relying on Dionysius Scytobrachion and several others. In subsequent books he preserves tales about the Seven Sages, legendary lawgivers, and Themistocles, giving us a window into Greek traditions. His version of the Peloponnesian War and its origins, based on Ephorus and possibly Philistus, provides an interesting contrast to Thucydides. Diodorus provides our only continuous narrative of the history of 4th-century BC Greece, including book 16, which is devoted entirely to Philip II of Macedon. Book 17 is the earliest continuous surviving narrative of the campaigns of Philip's son Alexander, an account possibly adapted from Cleitarchus. Books 18–20, based on the work of Hieronymus of Cardia, are our best source for the wars of Alexander's successors. In addition to all of this material, Diodorus often shifts the scene and discusses contemporary developments in his native Sicily, using the histories of such fellow Sicilians as Timaeus and Philinus. It has been aptly said that a history of that island would be impossible without Diodorus. Later fragments, including a large narrative of the Sicilian Slave War of c.136–132 BC, may ultimately derive from the work of Posidonius. In addition to many historical works, mythographies, and ethnographies, Diodorus summarizes at least one novel, *The Islands of the Sun* by Iambulus.

Diodorus' intent was to produce an all-encompassing, chronologically accurate, handy compendium of world history. He was neither a deep historical thinker nor an adept prose stylist. He avoids elevated language and overtly strives for a monotonous consistency in style. These considerations – combined with the patently derivative nature of his work – kept him from gaining acclaim or respect among his Augustan contemporaries. He is first mentioned in a backhanded compliment from Pliny, who notes that the *Library* of Diodorus, unlike most second-hand anthologies, has an honest title. However, generations of Greeks found his compendium so useful that it was preserved, while almost all other Hellenistic prose literature – stylistically out of fashion – was consigned to oblivion. Aelian was apparently familiar with him and Athenaeus cites him. He receives copious praise and use from chronographers and writers from Eusebius in the 4th century AD to John Tzetzes in the 12th. These writers valued utilitarian history over good style or subtle theories of

causation. Chronographers clearly also appreciated Diodorus' original integration of Roman and Greek chronology: even today he remains our earliest and most important source for the Roman *Fasti Consulares*. Diodorus was not always successful at synchronizing the Roman calendar with the Athenian one, and his work suffers from the embarrassing lapses one would expect from such a vast, self-published encyclopaedia. In the *Library* events are rigidly divided annalistically by archon and consular years, often interrupting the narrative and resulting in doublets and confusion.

In the Byzantine empire Diodorus' vision of a historical reference book seems to have found kindred spirits. Diodorus was summarized by Photios (Codex 70) whose praise is particularly effusive, complimenting his clear and unaffected style as well as his historical acumen. Another index of Diodorus' later popularity is the note in the *Suda* that Diodorus lived past the reign of Augustus, which possibly indicates a posthumous continuation of his work. Large fragments of lost books of Diodorus are preserved in the excerpts compiled under the direction of the emperor Constantine VII Porphyrogenetos (913–59), divided into convenient sections ostensibly for the purpose of ready reference by statesmen and scholars. The rediscovery of Diodorus in the west was also greeted with enthusiasm by a Renaissance reading public eager to learn more of the Greek past. This enthusiasm became muted in the following three centuries as Diodorus' intellectual poverty, his often compressed and muddled narrative, and frequently faulty chronology became more apparent.

Increasingly scholars are exploring the complex relationship between Diodorus' text and his sources. Even where it can be shown that Diodorus is rewriting earlier narratives, simply abridging and changing the style, he also adds his own interpretations and emphases. These interpretations, as well as the grand design of the work, provide an interesting picture of one Greek's view of history from a small town in Sicily during the Augustan era.

KENNETH MAYER

Biography

Born at Argyrium in Sicily, Diodorus "the Sicilian" wrote a world history from the creation down to his own time, ending in 60 BC. He visited Egypt c.60–56 BC after which he may have settled in Rome, completing his history c.30 BC. Of its 40 books only 15 survive intact, plus fragments of the rest. Despite many inaccuracies his work remains of value.

Diogenes Laertius

Biographer of the 2nd or 3rd century AD

Diogenes Laertius is the author of an extant compendium on the lives and doctrines of ancient philosophers that comprises ten books. In addition to this work, he wrote epigrams and he implies (1. 39) that he published a separate collection of them entitled *Pammetros* (Poems in Various Metres) in at least two books. Some of these epigrams on various philosophers are quoted in his historical work. Nothing is known about the author himself and the few references to himself in his work do not reveal much. There is no secure dating either of him or his work. The usual practice is to date him on the basis of the philosophers that he mentions (and does not mention). The latest figures that Diogenes refers to are Sextus Empiricus and Saturninus, both of them Pyrrhonian sceptics usually dated in the late 2nd century AD, while he does not mention any Neopythagorean or Neoplatonist philosopher. He probably lived in the late 2nd or early 3rd century AD. We know nothing of Diogenes’ education, where and with whom he studied philosophy for instance, and his philosophical allegiance is a matter of speculation. Neither do we know anything about the composition of his work except that it was apparently dedicated to a lady who had an interest in Plato (3. 47).

Diogenes begins with a general introduction in which he deals with some elementary questions such as the rise of philosophy, the spread of philosophy among the Greeks, and the main philosophical divisions. He advocates the idea that philosophy was a Greek and not a barbarian invention, despite certain intimations of wisdom among barbarian nations. More importantly, in his prologue Diogenes introduces two notions that are crucial for the arrangement of his

entire work, namely the notion of succession (*diadoche*) and that of a philosophical sect (*hairesis*). He arranges philosophers in two main successions, the Ionian and the Italian. The Ionian succession starts with Anaximander (going back to the Seven Sages) and goes down to the Stoics through Socrates, Plato, and the Peripatetics (it covers books 1–7), while the Italian succession starts with Pythagoras and continues with the Eleatics and the Atomists to end with Epicurus (books 8–10). Diogenes also distinguishes between dogmatic and sceptic (ephectic) philosophies. Then, following ancient doxographical literature, he gives us a list of the various philosophical sects and the names of their founders. Philosophers who do not belong to a sect and are only part of successions, like the Presocratics, are dispersed in various parts of the work.

The work seems finished as we have it (cf. 10. 138) but book 7 appears incomplete in the existing manuscripts, which leave off in the middle of a title in the list of Chrysippus' works. Each section in Diogenes' works has two main components, the biographical and the doxographical. Diogenes tends to follow a certain order in the arrangement of his material (origin, education, place in succession, sayings, anecdotes, works, doctrines, documents, other men with the same name). His usual practice is to give only the doctrines of the founder of the school, ignoring the additions and variations brought up by the successors. The sole exception is the Stoic school (book 7). The idea is that the founder's doctrines determine the philosophical point of the entire sect. Plato and Epicurus occupy one book each; Zeno the Stoic also enjoys an extensive presentation. The account of Plato presents clear similarities with Middle Platonist treatises of the 2nd century AD such as Albinus' *Isagoge* and Alcinous' *Didaskalikos*. The lists of works that Diogenes gives are invaluable since they tend to be quite comprehensive. Nevertheless Diogenes himself is unlikely to have consulted the original works of the philosophers he discusses, though in the case of Epicurus he cites three original Epicurean texts.

Diogenes' treatment of the various philosophers and philosophical schools is very uneven, and this obviously reflects the state of his sources. As far as the biographies are concerned, some of them consist of just anecdotes and apophthegms (Thales 1. 22–44, Polemo 4. 16–20), some contain only doxography (Anaximander 2. 1–2, Leucippus 9. 30–33), some are very long and well informed (Plato 3, the Stoics 7), others are very short (e.g. Aristotle 5. 28–40). As far as his doxography is concerned, the Stoic one is clearly the best of his whole work, whereas Aristotle's doxographical section is very poor in extent as well as in quality.

The problem of Diogenes' use of the sources is a complicated one. He does not seem to follow any one principal source in his work, and

in most cases he uses more than one authority, which he usually names. His principal sources are Antigonus of Carystus, Sotion, Hippobotus, Hermippus, Favorinus, Apollodorus of Athens. Like his sources, Diogenes' technique is to combine and excerpt various authorities (cf. 4. 1, 10. 29). This, however, does not mean that his book is merely patchwork. There is a clear structure behind the whole work, and there are also certain features that characterize his authorship. Yet the use of sources often determines Diogenes' reliability, which varies considerably from book to book and from section to section.

Diogenes' work is definitely a bad history of philosophy by our standards. The author is uncritical about the doxographical material that he reproduces; he does not venture any personal comments; the quality of his information varies considerably; and he has little sense of history. Yet Diogenes did not mean his work to be a history of philosophy in the modern sense. His intention was to present philosophers rather than their philosophy or the historical development of philosophy. His work is chiefly indebted to the genres of successions (*Diadochai*) and of philosophical sects (*Peri haireseon*) that provide the main components of his work, namely the historical-biographical part and the systematic doxographical part respectively. Yet it is difficult to classify Diogenes' work under a specific genre since, for all we know, no earlier work is exactly like his.

Diogenes' work is invaluable today because it is so rich in material from sources that have been lost. This is the only work of its kind that has survived intact from antiquity. Many Hellenistic sources are principally or solely known from Diogenes. His account of Stoic logic, for instance, is important for the reconstruction of Stoic logic. His work is not mentioned by later ancient sources. It seems, however, that it was used by the Byzantines. Stephanos of Byzantium (6th century) quotes Diogenes. The Byzantine lexicon of the *Suda* (10th century) draws heavily on his work for its philosophical entries. Furthermore the compiler of the *Anthologia Palatina* also knows and makes use of Diogenes.

Diogenes of Sinope

Philosopher of the 4th century BC

The oddest group of philosophers in ancient Athens were the Cynics, the dogs of philosophy, whose best-known representative was Diogenes of Sinope. It is not merely that people found (and still find) it easy to make fun of their way of life, for Athenians also poked fun at Socrates (most notably portrayed as a woolly-minded thinker and teacher of sophistries in Aristophanes' *Clouds*), Plato (also a target of comic poets), and Epicurus (whose moderate hedonism was exaggerated beyond recognition). Their oddity lies in the fact rather than that they were considered philosophers at all, given that their odd way of life was based on a kind of return to nature that seems antithetical to the reasoned arguments of philosophy such as were found in Plato's Academy, Aristotle's Peripatos, Epicurus' Garden, and Cleanthes' Stoa. As Antisthenes, the first Cynic, said, "Virtue lies in action, not arguments or learning", requiring nothing more than "Socratic strength". Ideology, then, or movement, rather than philosophy, better describes ancient Cynicism.

Humankind is not only unique among creatures in being capable of advance through intellect and technology, but in also being capable of arguing that it has gone too far and should regress and, to quote a Cynic, "live in accord with nature". One finds the germ of this implicit in the general Greek belief that life need not be luxurious and that one can be happy without the fancy clothes, perfumes, and food of the Persians and Lydians. Socrates, Aristotle, and others specifically argued that wealth contributes nothing of essence to true happiness. It was the Cynics, however, who set out the results of their animal studies showing that mice and dogs seem happy without clothes, fancy food, and any but the most primitive housing, and, perhaps most

significantly, with little in the way of social niceties. If dogs can snarl, why should humans gloss over the truth with social pieties?

The Cynics' status as philosophers was maintained, presumably on the basis of their arguments for their way of life, but none of their undoubted philosophical writings are extant (except for some spurious letters). What we have instead is primarily a series of telling, Zen-like, anecdotes designed to demonstrate in summary fashion the Cynics' attitude towards themselves and their fellow humans. Anecdotes of this sort are usually to be treated with great distrust, since all conform to the new Hellenistic fondness for literary biography; if used cautiously, however, they probably do paint a generally true picture of the Cynics' manners and teaching technique. Many of those anecdotes ascribed to Diogenes, moreover, depend upon a wicked (i.e. cynical) love of verbal play (almost always lost in translation) which grants them greater credence. In front of two badly painted Centaurs, for example, Diogenes asks "Which of them is Cheiron?", the famous Centaur whose name can also be read as *cheiron*, "worse".

The origin of the school was traced to Antisthenes, a follower of Socrates who was present at his death. It may well have been that the Cynosarges (White Dog) gymnasium where Antisthenes taught originally suggested the name Cynic for the school associated with him, but the association with dogs was one that the Cynics themselves would happily embrace. From Socrates, Antisthenes learned to emphasize the teaching of virtue for man's happiness; he also learned to emulate Socrates' endurance of physical hardship, raising this, as Socrates did not, to a tenet of his moral philosophy. Diogenes extended this to such an extent that he was said to be "Socrates gone mad".

Whether Antisthenes actually called himself a Cynic and whether others so regarded him is disputed. There is no doubt, however, that Diogenes, from the town of Sinope on the Black Sea, became and remains today even in popular belief the Cynic par excellence: living in a pithos (a large ceramic vessel) which he chilled in winter and heated in summer, eating without utensils, and snarling in mock canine fashion at all who approached him civilly, he outdid Timon of Athens in misanthropy. A particularly apt biographical anecdote has him forced to flee Sinope for having debased the coinage, erroneously having taken an oracle of Apollo too literally: it was rather the metaphorical coinage of civility that he was meant to debase. In Athens, the natural place for a philosophically inclined youth to visit, he fell in with both Antisthenes and Plato. With the former he developed his cynical ideas; to the metaphysical and political views of the latter he developed a marked antipathy which shows up in many of the stories. When, for example, Plato defined man as a featherless

biped, Diogenes held up a plucked chicken as something that met the two criteria. Plato's theories of Ideas came in for even harsher criticism. It is usually assumed that Diogenes' *Republic* was written to counter and doubtless to mock Plato's *Republic*.

Whether Diogenes did in fact write this or any other work is a matter of dispute, however. Whereas sonic sources specifically say that he wrote nothing, others not only list the genres in which he was said to have written, they also quote passages from them. In addition to philosophical dialogues and epistles, Diogenes is credited with tragedies in which he seems to have defended strange positions. In the *Atreus*, for example, the eating of human flesh was shown in a favourable light, just as Diogenes seems to have argued in his prose.

It is understandable that anyone who called himself a Cynic would regard Diogenes as a model. Suitably tempered, however, Cynic ideas of endurance, self-sufficiency, living in accord with nature, and deriving pleasure from the bare necessities of life proved attractive to other schools of philosophy, especially the Megarians, Stoics, and Epicureans. Diogenes' skilful manipulation of words, moreover, provided a model for such Cynical writers as Menippus, Meleager, and Cercidas among Hellenistic Greek writers, and, among the Romans, Seneca, whose *Apocolocyntosis*, a biting satire in both prose and poetry on the emperor Claudius, was modelled on Menippus' satires.

Biography

Born towards the end of the 5th century BC in Sinope, Diogenes was the archetypal Cynic philosopher. Exiled some time after 362 BC, he moved to Athens where he associated with Antisthenes and Plato. Living as close to nature as possible, he took shelter in a *pithos* and behaved like a dog. His writings have not survived. He died in the 320s BC.

Dionysius I c.430–367 ^{BC}

Tyrant of Syracuse

The most significant Greek ruler before the great Macedonians, whom he prefigured in many respects, Dionysius belonged to the upper class of Syracuse in Sicily. The most powerful of western Greek cities, Syracuse resembled Athens in some ways, except for the political instability that characterized it in common with most other Siceliot cities – constitutional government tended to alternate with lengthy periods of tyranny. A number of factors were responsible for this, the most important being the ever-present danger of conquest by Carthage. The establishment of Dionysius' autocracy was the direct outcome of the large-scale Carthaginian invasions of Sicily of 409 and 406 ^{BC}. His rise to power was a classic instance of how tyranny could be achieved through demagogy, and it is cited as such by Aristotle in the *Politics*. Threatened by the complete collapse of Greek Sicily in the face of the advancing Carthaginian army, the people of Syracuse elected Dionysius first as a general and then as sole general with full powers to deal with the danger that threatened. Shortly afterwards he tricked the army into providing him with a bodyguard, and instead of a saviour Syracuse found itself saddled with a master. Some time passed, however, before Dionysius was firmly in control and during this time he withstood two revolts, the first by the aristocratic cavalry and the second by the people in general. The latter revolt was suppressed, it would appear, with the help of Sparta. This marked the start of close cooperation between Sparta and the tyrant that served the interests of both, but gained Sparta much opprobrium. Between the revolts Dionysius signed a treaty with Carthage whereby the Carthaginians were left in control, whether direct or indirect, of most of Sicily, including all the Greek cities they had captured, while the tyrant was confined to little more than Syracuse (405 ^{BC}).

During the next few years Dionysius first extended his rule in eastern Sicily and then embarked on a programme of massive rearmament aimed against Carthage. Clearly he had not intended the settlement of 405 ^{BC} to be of any permanence. We hear of new types of warships and war engines being invented at this time. Launched in 398 ^{BC}, his attack on Punic-controlled Sicily met with initial success, including the capture of Motya, the Punic stronghold in western Sicily. He was then, however, forced to retreat after a counter-attack and, when his fleet was defeated off Catane, he found himself besieged at Syracuse. At this critical juncture a plague killed many of the besieging forces. Attacking, Dionysius destroyed most of the Carthaginian fleet and then, as a result of a secret deal (or so we are told), allowed the Carthaginians themselves (as opposed to their allies

and mercenaries) to sail away with what remained of their navy (396 BC). Though seriously weakened by his reverses, he recovered quickly and was able to check another Carthaginian campaign initiated in 393 BC. A stalemate having been reached, a new peace treaty was concluded (392 BC) which was much more favourable to the tyrant: all Greek Sicily was to be under Dionysius, and Carthage retained only the western corner of the island.

It was now the turn of Greek Italy. By a combination of military victories and clever diplomacy Dionysius soon succeeded in weakening the Italiot League and, having come to terms with it, in capturing Rhegium, a bitterly hostile city. He thus gained control of the strait of Messina, and annexed to his territories the whole of the toe of Italy. By 387 BC he was free to send to the Aegean a strong naval squadron to assist Sparta and Persia in imposing on Greece the infamous King's Peace. The 380s BC also witnessed the expansion of Dionysius' empire into the Adriatic, where he planted colonies and formed an alliance with the Illyrians. His main aim must have been the acquisition of vital resources in men, but above all of materials. A punitive raid in strength against the Etruscans (c.384 BC), traditional allies of the Carthaginians against the Greeks, must also have been motivated by a wish to improve his finances further, in preparation for another war with Carthage.

The Third Carthaginian War broke out in 383 BC and continued well into the 370s BC. It was fought by Dionysius on two fronts, in Sicily as well as in Italy, against both the Carthaginians and the Italiots who made common cause with Carthage. It is unfortunate that our main source for Dionysius (Diodorus Siculus) chose to give only a very brief and vague summary of what clearly was a major conflict. Victory went to Carthage. In the treaty that ended the war Dionysius was forced to recognize Himera as well as all Greek land west of the river Halycus as belonging to Carthage. He also had to pay a heavy indemnity. There was to be yet a Fourth Carthaginian War. Carthage, weakened by plague and a revolt of its subjects, invited attack by Dionysius in 368 BC. By then he had recovered sufficiently to be able to send mercenary forces to aid the Spartans (hard pressed after the disaster at Leuctra in 371 BC) at the same time as fighting Carthage. As in 398 BC, initial success was followed by reverses. Having concluded a truce in the winter, Dionysius died in the following year (367 BC). His son and successor Dionysius II subsequently made peace with Carthage on the same terms as his father in the 370s BC.

Though clearly a tyrant in the traditional Siceliot mould, characterized above all by disregard for convention and in holding life cheap, Dionysius nevertheless was a military despot on an altogether grander scale. In the level and range of his activities he bears

comparison with the Hellenistic rulers, not least in the way he prepared for and waged war, on both land and sea. Here he was way ahead of his time. Brave, energetic, ambitious, cultivated (he was a poet of some ability), resourceful, with few scruples to inhibit his actions, Dionysius exercised absolute control over a much larger area and population than any other Greek before him. In an age when oligarchy and monarchy were viewed with ever-increasing favour by the Greek intelligentsia at the expense of democracy, Dionysius' one-man rule could not fail to attract attention. No less a thinker than Plato took the trouble to visit the tyrant, and the influence that Dionysius exerted on Greek political philosophy, for better or worse, is one of his main, if rather intangible, legacies. On the one hand Dionysius can be said to have stemmed, temporarily at least, the advance of Carthage in Sicily. His policies, on the other hand, all calculated to increase and maintain his power, especially his reliance on (mostly barbarian) mercenaries and the wholesale destruction of Greek cities and the transplantation of their populations, undoubtedly undermined the morale and sapped the stamina of western Hellenism.

P.J. STYLIANOU

Biography

Born c.430 BC, Dionysius came to power in Syracuse in 405 BC as a direct result of Carthaginian attacks on Sicily in 409 and 406 BC. Consolidating his position with the help of Sparta, he made himself master of all Greek Sicily, confining Carthage to the western corner. He then (387 BC) extended his influence into south Italy as far as the Adriatic and was active against the Etruscans. After further fighting with Carthage he died in 367 BC and was succeeded by his son Dionysius II.

Dionysius of Halicarnassus

Historian of the 1st century BC

In the second half of the 1st century BC a literary trend developed which was to have the greatest impact on the future course of Greek

literature down to the Byzantine age and even beyond. It was the time of the quite spectacular breakthrough of Atticism, according to which speeches and literature should be modelled after the great authors of Classical, i.e. pre-Hellenistic, times. Most prominent among the initiators of this movement were the rhetoricians and historians Caecilius of Caleacte and Dionysius of Halicarnassus.

When Dionysius arrived in Rome in 30/29 BC, the capital had already become a centre for Greek intellectual activity. Dionysius does not seem to have had any difficulties in finding Greek and Roman friends and patrons, among whom Caecilius was the most remarkable literary figure and Quintus Aelius Tubero, jurist, annalist, and father of two consuls, the most influential political personality. Dionysius wrote many rhetorical and critical treatises for these friends and was a private teacher to their sons. But he devoted most of his time to composing his monumental work on early Rome, the *Roman Antiquities*.

In the preface to his study *On Ancient Orators* – a singular manifesto-like text – Dionysius unfolded a tripartite conception of history: the heyday of the “old philosophical rhetoric”, he declared, was followed by a period of decay after the death of Alexander the Great, but the time in which he lived saw a powerful revival of the time-honoured “Attic” rhetoric. Dionysius attributed this change to the influence of Rome and its well-educated elite. In this conception, the orators and authors of the good, older time were regarded as classical models with normative power, whereas the whole literature of the Hellenistic period he rejected as “Asianic”. In order to produce good speeches and literature, so Dionysius argued, one had to turn to the classics and imitate them. In his rhetorical and critical studies Dionysius attempted to show which authors were worthy of imitation (*mimesis*), how imitation should work, and which qualities in particular should be espoused, and which mistakes avoided. Dionysius thus proposed an eclectic procedure combining the good qualities of several Classical authors and at the same time avoiding all their flaws. By this means one could hope to rival the classics or even to surpass them. Dionysius took it for granted that the Classical authors had already proceeded in this way themselves: most successful of all the Attic orators, according to Dionysius, was Demosthenes, whose “mixed style” he therefore preferred.

The tremendous success of Atticism is clearly illustrated by the fact that, whereas Hellenistic literature was for the most part lost (except for some more technical works handed down because of their content), the works of the Classics (as well as those of the Classicists) have been preserved to a remarkable extent. This was possible only because Classicism was readily embraced and disseminated by the

rhetorical schools. As far as we can see, it is in Dionysius' treatises that literary criticism is for the first time pursued not primarily as a means to explain a given text or author but almost exclusively in order to provide material for imitation. It is obviously for their practical value that these critical studies have often been read and thus have mostly been preserved. In the 1st century AD they were cited several times by the Roman rhetorician Quintilian, and the unknown author of *Peri Hypsous* (On the Sublime) clearly knows them, although there is no explicit reference. For instance, the latter used the critical device developed by Dionysius of rewriting a certain passage in order to show how important its rhythm is. The unknown author of the pseudo-Plutarchean treatise *On the Ten Orators* uses many passages from Dionysius without indicating his source, whereas an anonymous commentator on book 2 of Thucydides replies to some of the criticism made by Dionysius in his study *On Thucydides* (P.Oxy. 853; 2nd century).

In the 2nd and 3rd centuries AD Atticism became increasingly concerned or even obsessed with the purity of language. Purists of the time would accept only the vocabulary and the syntactical formations found in the Attic authors. For Dionysius and Caecilius, Atticism had been primarily a matter of style, but clearly the purism of the Second Sophistic would not have been possible without the success of stylistic Atticism. Indeed, in the 9th century the patriarch and scholar Photios was to criticize Dionysius' use of neologisms (cod. 83), which were, of course, profoundly antipathetic to purists. Nevertheless, Dionysius' treatises continued to be used – for example, by the rhetorician Hermogenes, still in the 2nd century – although direct references are rare, and even more extensively with many direct citations by his commentators, namely Syrianus (4th/5th century). As the Hermogenic corpus became the standard rhetorical textbook for the whole Byzantine period and was still much in use in the Renaissance, Dionysius' authority remained unquestioned throughout the centuries. He was read by the rhetorician Libanius and the sophist Lachares (4th/5th century). An anonymous rhetorician, perhaps John Doxapatres (11th century), was a particularly fervent admirer, as he calls Dionysius “the master and good father of our art”. Another anonymous rhetorician of the 10th/11th century, who wrote a commentary on Hermogenes, cited passages from many different treatises and seemed to know the whole of Dionysius' critical work. John Sikeliotes (12th century), a better-known commentator on Hermogenes at the time, refers directly to Dionysius. Epitomes have been made of the studies *On Imitation* and – probably in the 10th century or perhaps by Maximos Planudes (13th century) – *On Stylistic Composition*. The latter work was also widely used by Psellos (11th

century), whose study *On the Composition of the Parts of Speech* consists to a large extent of extracts from it.

Of the 20 books of the *Roman Antiquities*, books 1–10 have been preserved entirely and book 11 partly. Books 12–20 survive only in excerpts, about one half of them from the collection made of Classical and later historians by order of the emperor Constantine VII Porphyrogenetos (10th century), and the other half from an epitome preserved in a 15th-century manuscript. According to Photios, who could still read the complete work (cod. 84), Dionysius had himself made an epitome in five volumes. The history extends “from the oldest myths ... to the beginning of the First Punic War” (1. 8. 1f), i.e. the year 264 BC, with which Polybius’ history begins. Dionysius designed the *Antiquities* as a model for what can be produced by eclectic *mimesis*, but he also had a political message and an educational aim: he attempted to show that Rome was in fact a Greek foundation, Latin a Greek dialect, and the early Romans indeed Greeks – not only ethnically, but also in terms of their high moral standards. Dionysius thus justified Roman rule over the Greeks and at the same time presented Roman statesmen of the past as models for those of the present. Dionysius wished to be an educator like Isocrates, aiming to teach both good behaviour and good speaking.

The *Roman Antiquities* seems to have been quite popular, although direct references are few. Josephus’ *Jewish Antiquities* in 20 volumes is obviously modelled on it, as are some aspects of his style. Plutarch used it for some of his *Lives*; in some cases (e.g. for the *Coriolanus*) it was his main source. Appian and Cassius Dio also seem to have referred to the *Antiquities*, though perhaps through an intermediary source. As a note by an anonymous writer in the earliest manuscript of Appian makes plain (cod. Vat. graec. 141; 11th/12th century), the account of Italian history and the earliest history of Rome were the most popular parts (hence perhaps the loss of the later books). In the Byzantine period the *Roman Antiquities* was used by Constantine Manasses, who drew on it for his *Chronike Synopsis* (12th century), as did John Kanabutzes (15th century) for his little geographical-historical miscellany *In Dionysium Halicarnassensem Commentarius*.

Over the last 200 years Dionysius has often been criticized and even despised for his hated Classicism and his positive approach to Rome. It should be borne in mind, however, that his Isocratean ideal of education (*paideia*), based on a sound knowledge of the Classical authors, proved to be one of the most important and persistent factors of Greek elite identity for many centuries.

Biography

A native of Halicarnassus, Dionysius moved to Rome in 30 BC where he taught rhetoric for many years. He also wrote many works of literary criticism, notably on Thucydides and the Attic orators. But his principal work was entitled *Roman Antiquities*, a history of Rome from its beginnings to the start of the First Punic War (where Polybius begins), in 20 books, of which books 1–10 survive intact, book 11 in part, and the rest only in excerpts. His thesis was that Rome was a Greek city, Latin a Greek dialect, and Romans really Greeks.

Dioscurides fl. c.^{AD} 45–75

Physician

Pedanius Dioscurides of Anazarbus in Roman Cilicia (southeastern Asia Minor) wrote *On Materia Medica*, one of the more influential pharmacological works of the pre-modern period. The preface suggests that he studied under Arius in Tarsus and that he travelled extensively to collect information on the medicinal uses of plants, animal products, and minerals. His journeys probably took him to many of the places mentioned in his work, including much of Asia Minor, the Greek mainland, northern Egypt, Syria, Crete, Cyprus, and the Nabataean capital Petra. Following earlier traditions, he also described exotic substances from more remote areas (including Britain, Gaul, Iberia, Ethiopia, Armenia, and India), few of which he is likely to have visited. His explicit association of his pharmacological odyssey (“traversing much of the earth”, Preface 4, an echo of *Odyssey*, 4. 268, 2. 364, etc.) with a “military” or “soldierlike life” prompted later writers to draw the controversial inference that he had been a physician in the Roman army.

Several other extant Greek texts are attributed to Dioscurides by later ancient writers and by Byzantine authors and scribes. These include *On Noxious Drugs*, *On Venomous Animals*, and *On Simple Drugs* (also transmitted as *Euporista*, “Readily Accessible Remedies”). A modern critical consensus has, however, rendered their authenticity doubtful.

In scope, thoroughness, and detail, Dioscurides’ *On Materia Medica* probably exceeded its many ancient predecessors. He discussed the medicinal properties of more than a thousand natural substances (about 800 of these botanical, the rest mineral and animal), and recorded well over 4,000 uses for them, whereas the works attributed to Hippocrates, for example, had referred to fewer than half as many substances. In his preface Dioscurides criticizes different predecessors by name for different flaws: omitting useful substances, imprecision, false information, second-hand knowledge, and poor structure, resulting in works that are impossible to memorize. His own work, he promises, will be superior in its completeness, accuracy, organization, systematicity, and detailed personal observation, with careful attention to topography, climate, seasons, and local botanical variations, as these pertain to the collection, cleaning, preparation, preservation, and storage of drugs.

Dioscurides’ predecessors had listed pharmacological substances under individual disorders (e.g. Hippocratic Corpus) or alphabetically (Crateuas) or according to external, often morphological characteristics (Sextius Niger), whereas the sequence adopted by Dioscurides in his five books is as follows: (1) aromatics, oils, ointments, trees, shrubs; (2) animals, animal products (honey, milk, fat), cereals, vegetables, garden herbs; (3) roots, botanical juices,

further herbs, seeds; (4) further roots and herbs; (5) wines, other potables, minerals. The organizational principles that prompted this arrangement are far from transparent, but a recurrent structural device might be grouping together substances according to affinities displayed by their *dynameis* (usually translated “properties”), i.e. by their “powers” to act upon something, for example, by having a heating, softening, astringent, diuretical, drying, cooling, “ripening”, somniferous, relaxing, dispersing, aphrodisiac, or antaphrodisiac effect. In all, he identifies more than 300 kinds of qualitative medicinal effects. Yet Dioscurides never explicitly claims such similarities in the “power to effect” as the principle that informs his overall arrangement, and some later readers, not recognizing any consistent, clear structure, reorganized his text to give it a more accessible arrangement. An alphabetical version, probably produced between the 2nd and 4th centuries AD, is extant in a 6th-century manuscript (the “Vienna Dioscurides”, see below) and in later manuscripts.

A subsidiary ordering sequence, discernible in the botanical sections, is testimony to Dioscurides’ attempt at thoroughness. One chapter is devoted to each plant, and within each chapter the following pattern tends to be maintained: name of the plant; synonyms; typical location; botanical description, medicinal properties; preparation and application; occasional references to harmful side effects; dosage; collection, processing, and storage; forgeries and how to detect them; at times, veterinary, magical and non-medical uses; sometimes geographic distribution.

Each botanical chapter was probably also accompanied by an illustration of the plant, as in the earliest surviving Greek manuscript, the “Vienna Dioscurides”. Now in Vienna (Österreichische Nationalbibliothek) this manuscript preserves an alphabetical version of Dioscurides’ work. Copied in AD 512–13 in Constantinople for Princess Anicia Juliana, daughter of Placidia the Younger and of the western emperor Olybrius, the Vienna Dioscurides is the most lavishly produced of extant Byzantine scientific manuscripts, preserving almost 500 miniatures, mostly full-page paintings of plants. Different visual traditions are, however, discernible in the manuscript tradition, and it is unclear which, if any, of these derive from Dioscurides’ original work. In the Vienna Dioscurides art historians have differentiated between a more abstract group of illustrations and a more naturalistic group, and a Neapolitan manuscript of the 7th century AD (now in the Biblioteca Nazionale, Naples), containing 403 plant illustrations of an inferior quality, also appears to represent more than one visual tradition. Illustrated pharmacological and other medical works none the less are well attested at least from the Hellenistic period and,

modern expressions of doubt notwithstanding, it is likely that Dioscurides' original text, too, was illustrated.

The high regard in which Dioscurides' *On Materia Medica* was held in the Greek world until the early modern period is evident from the frequency with which later Greeks referred to him, quoted him, annotated his text, copied it, and plagiarized it. Dioscurides' contemporary Erotianus quoted him in his Hippocratic lexicon, and in the next generation two great Greek pharmacologists of the Flavian period, Asclepiades the Younger ("Pharmakion") and Andromachus the Younger, took ample account of Dioscurides' work. At the time of the emperor Trajan, Rufus of Ephesus explicitly acknowledged Dioscurides as an eminent authority, and under Hadrian another Ephesian, Soranus, drew on him in his Hippocratic glossary (fragments of which seem to survive in Hesychius' 5th-century lexicon of rare words). In the last six books of his work on simple drugs Galen by and large adapted Dioscurides' views to his own pharmacological system. In the 4th century AD Oribasius (*Collectiones Medicae* 11–13) recorded many lengthy verbatim excerpts from Dioscurides, arranged alphabetically. Writers of the 6th and 7th centuries who drew on (or knew of) Dioscurides' work include Aëtius of Amida (who offers excerpts), Alexander of Tralles, Stephanus of Byzantium, and Paul of Aegina. In the 9th century Photios seems to have had direct access to the *Materia Medica*, which he held in very high regard (*Bibliotheca*, cod. 178).

An impressive copy of the Vienna Dioscurides (New York, Pierpont Morgan Library) was produced in the 10th century. At about the same time Romanos II (emperor 959–63) sent another illustrated version from Constantinople to the caliph of Cordoba. Further evidence of Dioscurides' popularity throughout the Byzantine period is provided by the numerous comments entered in manuscripts of his text by physicians and others. Greek monks in the monastery of St John Prodromos in Petra, for example, made many annotations in the Vienna Dioscurides in the 14th and 15th centuries. A further measure of Dioscurides' influence was the active reception of his work both by the Latin west and by medieval Islam. Early Latin, Syriac, and Arabic translations ensured that for centuries Dioscurides served as a paradigm and source for three major cultural areas: the eastern Greek culture of Byzantium, Islamic civilization, and the western Christian Latin realms.

Diplomacy

Whether extant evidence of diplomatic activity in Mesopotamia and pharaonic Egypt points to the existence of a diplomatic system is still the subject of academic debate, evidence of such a system in the case of ancient Greece, by contrast, is abundant and undisputed. Significantly, however, the practice of diplomatic exchanges was confined almost entirely to the Greek world. By virtue of its geographical position ancient mainland Greece was for long periods of its development free from external pressure (although this was of

course not so in the case of settlements in the eastern and western peripheries of the Greek world). Under such conditions a cluster of small states emerged, often misleadingly referred to as “city states”. The rise of the polis, the “self-governing state”, was no doubt aided also by these states’ relative isolation in the mountainous terrain of the mainland, which could not easily be traversed. Thus separated by topography, but connected by sea routes, the states needed to develop a means of regular communication. A further incentive for the growth of this protodiplomatic traffic was the fact that no single polis was powerful enough to establish some form of hegemony over the others. The relative equilibrium that resulted and the absence of external pressure meant that individual states dealt with each other on a basis of equality. Their common cultural background and a shared language obviously facilitated the transaction of diplomatic business. Yet, it is also true that Greek diplomacy possessed no conception of norms and rules of proper diplomatic conduct. So intense was the citizen’s loyalty to his polis, and so deep was his suspicion of the *xenoi*, the foreigners from beyond the boundaries of his state, that inter-polis relations were highly quarrelsome. But while this characteristic tended to increase the frequency of diplomatic exchanges, it also prevented the emergence of a recognized uniform diplomatic system. What, however, did emerge was a pattern, both administrative and behavioural, that bore surprising similarities to modern international diplomacy.

The modern practice of maintaining permanent diplomatic missions in foreign capitals was, of course, unknown to the Hellenic world. Indeed, this did not become established practice until the heyday of Venetian diplomacy in the 15th century. The hallmark of ancient Greek diplomacy, by contrast, was the frequent dispatch and reception of temporary, or *ad hoc*, legations. The Greeks dealt with foreign-policy issues as and when they arose. The ancient equivalent to the modern ambassador or envoy was the *presbys*, or elder. Chosen for his known respectability and his knowledge of political affairs, he was appointed to a temporary mission to negotiate the settlement of a specific problem with a foreign state.

To the modern observer the most striking feature of Greek diplomacy is its relative openness and the suspicion with which the *presbeis* were often regarded by their own people. Greek ambassadors were generally chosen, by the assembly of their polis, not so much for their skills as negotiators but rather for their representative qualities. The policy to be pursued by the envoys was debated publicly by the assembly, and the negotiating strategy laid down in detailed, and usually restrictive, instructions. The modern practice of furnishing ambassadors with plenipotentiary powers seems to have been virtually

unknown in ancient Greece. Such was the suspicion of their own diplomats that the Greeks tended to send missions on a large scale, usually composed of several *presbeis*, not infrequently as many as ten. This practice served a dual purpose. The large number of usually highly skilled orators as envoys was meant to increase the weight of the sending state's case. But, most importantly, it was a device to address domestic needs. Different envoys represented different factions at home. A large mission was therefore broadly representative of the different points of view entertained by the assembly at home. The accommodation of domestic animosities was, however, not conducive to diplomatic effectiveness. Instead of conveying an impression of unity of purpose, a large mission suggested to the receiving polis domestic strife in the sending state. An often quoted example of this was the Athenian mission to the court of Philip of Macedon in 346 BC, which was remarkable more for the strictures uttered by the celebrated rival orators Aeschines and Demosthenes against each other than for its negotiating success. Such personal animosities in large, mixed embassies were thus liable to be exploited by the receiving state. It is indeed remarkable, as Harold Nicolson noted, "that intelligent people should have permitted so bad a diplomatic method to survive".

The openness of Greek diplomacy extended not only to the appointment and dispatch of embassies but also to the transaction of their business abroad. Equipped with credentials issued by their own assemblies, the *presbeis* were led on their arrival to the assembly of the host state. Diplomatic negotiations were conducted orally and, it seems, publicly. The individual members of the mission each delivered a set speech along the lines fixed by their home assembly; open negotiations would then ensue. If an agreement resulted, its terms were engraved in a tablet, to be displayed in public. The ratification of any such agreement was by public exchange of oaths. The public nature of Greek diplomacy may also account for the frequent censuring of the returning mission by its own polis. Occasionally the returning ambassadors were even prosecuted, as for example was Aeschines, whose character had been tarnished by his accepting a bribe from the Macedonian prince, and who was consequently banished to Rhodes.

Another important feature of Greek diplomacy was the evolution of the office of *proxenos*, which was roughly that of the modern consul. In contrast to his modern successors the *proxenos* was a native of his polis, in which he resided while acting on behalf of another state and protecting the interests of the latter's citizens; it did not, however, include conducting diplomatic negotiations. Although the post of *proxenos* was one of honour, and many distinguished men strove to

obtain it, the *proxenoi* were also often the leaders of the political faction which was favourably disposed towards the state they represented.

Its ad hoc nature and its public character, the lack of any administrative structure and of record keeping no doubt hampered Greek diplomacy. It was largely inconsistent, and the lack of domestic unity often rendered it ineffective. But the constancy and intensity of diplomatic exchanges, the recognition of diplomatic immunity, or the accepted principles of declaring war and concluding peace all indicate that the Greeks had developed a sophisticated and elaborate diplomatic apparatus. The Amphictionic Council, the leagues, and alliances demonstrate that the ancient Greeks understood the importance of the combinations of forces. The Delian League, for instance, organized and maintained under the hegemony of the Athenians for the better part of the 5th century BC, brought together 200 states in an anti-Persian combination. Without a sophisticated web of diplomatic exchanges such a feat would have been impossible.

Disease

The earliest aetiological explanation of disease (*nosos*, *nousos*) in Greek literature is found in Hesiod's mythical description of the Golden Age of man in his *Works and Days* (90–105), a text dating from the 8th century BC. Hesiod envisages a purely masculine society free from the adversities that beset men nowadays – women, toil, and, significantly, disease: only when the first woman, Pandora, opens the jar are diseases released into the world as a punishment to men from Zeus. Henceforward, diseases roam the earth of their own accord, a constant bane to mortals.

This ancient notion of disease, that they are divine in origin and may be a symptom of divine displeasure at mortal mis-deeds, was a persistent feature of Hellenic thinking from Homer onwards: at the very beginning of the *Iliad* Apollo sweeps a terrible plague through the ranks of the Achaeans because Agamemnon has insulted one of his Trojan priests (1. 10f.); the plague that devastates Sophocles' Thebes is a result of the religious pollution (*miasma*) brought upon the whole community by Oedipus; "the Sacred Disease", epilepsy, was attributed

in antiquity to divine visitation; in the medieval period illnesses such as leprosy could be interpreted as divine retribution.

Yet just as diseases were thought to be inflicted by the gods, so their remedy was sought in prayer and sacrifice. In Greek antiquity many gods and heroes had the power to send and relieve sickness – for example, Artemis was invoked as a healer of women, but Apollo in particular was both the bringer and healer of disease, given the epithets of “doctor” (*iatros*) and “saviour” (*epikourios*). Both Homer’s Achaeans and Sophocles’ Thebans find a cure for their communal sickness by supplicating Apollo, while in 430 BC at the end of the great plague of Athens a shrine was dedicated to Apollo the Helper at Bassae.

Also important as a healer of disease was Apollo’s son Asclepius, the father of Hygeia (Health) and the exemplary physician of the earliest Greek poetry (Homer, *Iliad*, 11. 833; *Hymnus Homericus ad Apollinem*, 210; Hesiod, fr.50), whose staff with a snake coiled around it is a symbol of the medical profession still. Asclepius had many cult sites throughout Greece, the largest of which was established at the end of the 6th century BC at Epidaurus; there were important sanctuaries too at Pergamum and Cos. The sick sought a cure for their disease through purification, sacrifice, and, above all, the practice of incubation – the patient slept in the sanctuary in the hope of being granted a direct cure or at least of receiving helpful instructions from the god in a dream.

Such appeals to the supernatural for relief from sickness reflect the paucity of defences available in antiquity against disease of often epidemic proportions. Thucydides’ account of the Athenian plague in the late 5th century BC (2. 47ff.) is a powerful reminder of the despair and social devastation that such widespread and uncontrollable attacks of disease could produce, while Sophocles’ *Oedipus Tyrannus*, produced during the same plague, dramatized the helplessness of a city ravaged by disease. Such epidemics raged through the Hellenic world on a regular basis: in AD 542 devastating bubonic plague gripped Byzantium and the whole Levant; in AD 744–47 plague resulted in the serious depopulation of Constantinople; and outbreaks of plague recurred throughout the medieval period. Whole populations were affected by other diseases too; there was an epidemic of leprosy at the beginning of the 3rd century BC in Alexandria and the disease was endemic throughout Europe in the 11th and 12th centuries, perhaps spread by the Crusaders, while malaria (which was said to have killed Alexander) was rife in the Classical period and again after the fall of Byzantium. Poor sanitation and urban overcrowding, especially in times of war and its aftermath, contributed to the spread of contagious diseases as did travel and trade within the Mediterranean and beyond

to the East, to Africa, and to central Europe. Thucydides reports that the great plague of Athens started at the Piraeus.

Yet alongside supernatural ideas about illness which persisted into the Christian era, when saints took over the role of the ancient gods and heroes as healers of the sick, the Greek thinkers of antiquity sought natural explanations for the origins of disease. From the 5th century BC onward in Greece, Ionia, and Sicily there developed a body of knowledge about diseases, their classification, diagnosis, origins, treatment, and even prevention. Theories of disease were linked with contemporary scientific and philosophical doctrines and indeed writers outside the medical profession were interested in the nature of sickness and health; Plato gives a detailed account of the origin of disease in the *Timaeus* while Aristotle often discusses disease and may have written a work on the subject.

The most important extant collection of writing on disease from the ancient Hellenic world, however, is the Hippocratic corpus, which comprises about 60 treatises, most of which were written between 430 and 330 BC and which was assembled as a body of work probably by Alexandrian scholars in the 3rd century BC. This collection, the first systematic investigation and analysis of diseases and their treatment, takes its name from Hippocrates, the most famous member of a 5th-century BC guild of doctors from Cos who claimed Asclepius as an ancestor. However, no treatise of the corpus can be attributed directly to Hippocrates – the works are anonymous, written by an assortment of medics from Cos, Cnidus, and elsewhere who express a variety of opinions on diseases and their treatment. Some of the treatises are lectures on physiology and anatomy (*On the Nature of Man*, *On the Nature of the Child*, *The Heart*); some deal with the diseases of women in particular (*On the Diseases of Women 1 and 2*, *On the Diseases of Young Girls*); and some offer theories of the influence of environment on disease (*Airs, Waters, Places*) or advice on the treatment or prevention of disease (*Regimen in Acute Diseases*, *A Regimen for Health*). One significant and influential feature of the corpus is the emphasis given to the systematic observation of patients' symptoms – seven books of the collection consist of case notes (*Epidemics 1 and 3* are the earliest and most interesting) and, while retrospective diagnosis can be problematic, many specific diseases from diphtheria to tuberculosis can be identified from these detailed accounts.

Various theories regarding the origin of diseases are put forward by the Hippocratic writers and their ideas are sometimes at variance. There are, however, several unifying features, the most significant of which is an insistence that all diseases are natural rather than supernatural in origin, that “each disease has a natural cause and nothing happens without a natural cause” (*Airs, Waters and Places*, ch.

22; cf. *Science of Medicine*, ch. 6). Even epilepsy is given a natural aetiology by one medical writer who devoted a whole treatise (*The Sacred Disease*) to a discussion of the cause of the sickness and who attacks the “witch doctors and charlatans” who attribute epilepsy to a divine element.

The Hippocratic corpus contains several theories of the natural causes of disease. Environmental factors such as climate and water supply were thought to be responsible when many people in a locality exhibited common symptoms, and the concept of contagion was recognized by Thucydides at least; but a variety of diseases in a population indicated that the cause lay in the individual, specifically in relation to his or her diet and habits. Perhaps the most influential aspect of Hippocratic nosology is the common theory that diseases resulted from an imbalance in the constituents of the body. This idea can be traced back to a follower of Pythagoras, Alcmaeon of Croton, who was influenced too by the theories of the Presocratic philosopher Empedocles who posited that everything consists of four primary elements – air, fire, earth, and water. Alcmaeon claimed that “health is the mixture of the qualities in the proper proportion” (fr. 4 Diels-Kranz, from c.500 BC) and that, if this equality of influence (*isonomia*) were disturbed, disease would result. Alcmaeon and many of the Hippocratic writers suggested that imbalances between “primary opposites” such as hot and cold, wet and dry, were responsible for diseases, while other pathological theories were based on an imbalance of humours, in which deficiencies or excesses of the body’s “juices” (*chymoi*), particularly bile and phlegm, gave rise to diseases (see for example *Diseases 1*, ch. 2; *Affections*, ch. 1; *Epidemics 1* and 2). The writer of the treatise *On the Nature of Man* added two additional humours, black bile (choler) and blood, to this scheme, and this doctrine of four humours formed the basis of Western medical theory throughout the medieval period and beyond. Physical imbalances that caused disease could result from environmental factors such as geographical location or climatic conditions which rendered individuals “phlegmatic” or “bilious” and thus susceptible to particular pathological conditions (*Airs, Waters, Places* deals with this theme), while an overindulgence in food, drink, and sex was considered especially deleterious to the health – the Apollonian maxim “nothing to excess” exemplifies the Greek attitude to unrestrained behaviour and its consequences in matters of health as elsewhere.

The medical writers of antiquity recognized the importance of preventative medicine as a factor in the avoidance of disease; the treatise *A Regimen for Health* in particular offers advice on diet and exercise. Indeed the typical Greek diet of fruit and vegetables, whole

grains, olive oil, and fish, combined with few animal fats and refined food, which remained largely unchanged until the very recent past, may have conferred some protection against many pathological conditions such as heart disease and various cancers.

In the ancient and medieval Hellenic world, prevention was most certainly better than a cure for disease, if indeed a cure could be found. Doctors (*iatroi*) regularly bled and purged their unfortunate patients and, while the efficacy of plants in the treatment of sickness was recognized at least as long ago as Homeric epic and drug therapy may have provided some relief from the symptoms of illness, prescriptions from the ancient pharmacopoeia supplied few if any effective cures for disease. Patients were treated at home. The first civilian hospital was founded in the middle of the 4th century AD by St Basil the Great, bishop of Caesarea, yet hospitals benefited only a few and attempts to prevent and treat disease were largely inadequate until the very recent past; as recently as the 1960s one study of health and disease in the population of rural Greece discovered a remarkable similarity to the nosology of the Hippocratic texts of the 5th century BC (see Blum and Blum, 1965).

Dithyramb

The dithyramb was a choral song performed in honour of Dionysus. The original meaning of the word itself is obscure; the root *-amb* may be pre-Greek, but it nonetheless suggests a kinship with *iambos*, *thriambos*, and *ithumbos*, all terms for songs with early connections with Dionysus. Surviving evidence seems to indicate that the history of the genre can be divided into three phases: dithyramb as pre-literate cult song, the incorporation of choral dithyramb into formal competitions in the 6th century BC, and the drastic renovation of the genre at the hands of the poets of the “new music” in the latter part of the 5th century.

Earliest evidence of the dithyramb comes from Archilochus of Paros in the 7th century BC. Although the passage in question does not itself appear to be dithyrambic, Archilochus speaks of knowing how “to lead off the dithyramb of lord Dionysus” when his “wits are thunderstruck with wine” (fr. 120 West²). Archilochus’ use of the verb *exarchein* (“to lead off”) finds a parallel in a number of early texts describing the formal conduct of communal songs such as the lament and wedding song (*Iliad*, 24. 723; *Odyssey*, 4. 15–19), and Archilochus himself also used it of the paean (fr. 121 West²). These passages suggest a kind of song in which a leader engages in exchanges with a chorus, although the precise nature of such songs and the kind of Dionysiac occasion in which the dithyramb was performed remain uncertain. Aristotle seemed to be thinking in similar terms when he recorded that tragedy originated “from those leading off the dithyramb”, just as comedy arose from the leaders of the phallic song (*Poetics*, 1449a10). Similarly Proclus finds the origin of the dithyramb in “rustic play and festivities at drinking parties” (*Chrest.* 51 [320b21]). Aristotle also adds that drama came into being from an “improvisatory beginning”, and this may be taken to indicate that early dithyrambs were not formal poetic compositions that were preserved in writing. In this light it is hazardous to make inferences

concerning this period from the later dithyramb, especially since the genre underwent significant change in the 5th century BC. It is particularly important to note that the frequent assertion that the early dithyramb was a vehicle for myth, detailing the nature of Dionysus and his history, is not directly supported by the evidence, but is an uncertain inference drawn from later practice.

Herodotus records that Arion of Methymna “was the first man that we know of to compose a dithyramb and so name it and produce it in Corinth” (1. 23). This statement has aroused considerable controversy, especially concerning the precise implications of *onomasanta* (“having named it”). In light of the earlier evidence of Archilochus, it is very unlikely that Arion can have invented the genre itself. Accordingly, it has been plausibly suggested that Herodotus is referring to the formal introduction in Corinth of a choral song performed by a trained choir, to which the name “dithyramb” was given. The alternative view, that *onomasanta* means “entitled”, has been widely held, but it unconvincingly pushes back into the 7th century BC the practice of applying titles to dithyramps, a practice that is only securely attested for the 5th century BC.

Arion’s activities in Corinth should be understood within the broader context of the initiatives of the early tyrants in numerous Greek cities, where local pride was fostered and civic ideology promoted through the establishment of poetic contests. Such contests were regularly part of religious festivals, and attracted competitors from across Greece. Little is known of the details of Arion’s activity at Corinth, but it seems to have been well known to later practitioners of the genre. When Pindar asks in a victory ode composed for a Corinthian victor, “Whence came the delights of Dionysus with the ox-driving dithyramb?”, the ancient commentators tell us that he is referring to Arion, and we can make the further inference that the dithyramb is called “ox-driving” (*boelatas*) because oxen were the prizes in the dithyrambic competition and they were sacrificed as part of the festival. There were no doubt strong similarities between such dithyrambic contests and the better-attested tragic competitions in Athens.

As is regularly the case, more is known about Athenian practice. Lasus of Hermione (b. 548/4 BC) is said to have established the dithyrambic competitions at Athens. We have some idea of the way in which the contests were organized: each of the ten Athenian tribes competed with one chorus of men and one of boys, and the size of these choruses was fixed at 50 in each case. As in the case of the dramatic competitions, a producer, called a *choregos*, presided over the performance, not only seeing to the equipping of the chorus, but also providing fees for the poet, the choral trainer (*chorodidaskalos*), and

the accompanist, the *auletes*, who played the *aulos*, a double-reed instrument. There is evidence for dithyrambic performances at a number of Athenian festivals: the City Dionysia, Thargelia, Panathenaea, Prometheia, and the Hephaestia. Hypodicus of Chalcis, who is now little more than a name, was the first victor at the Dionysia in 509/8 BC, and this may imply that the dithyrambic competition postdated the formal institution of the tragic competitions, an event traditionally assigned to c.535 BC. The poets are never mentioned in inscriptions commemorating victories, and this suggests that the contests were a competition among the tribes, who commissioned dithyrambic poems from distinguished poets from around the Greek world. The victorious *choregos* typically set up in the Street of Tripods a tripod with a dedicatory inscription.

In the first part of the 5th century BC the most successful poets of the dithyramb were Simonides, Pindar, and Bacchylides. An anonymous epigram, usually dated to the Hellenistic period, mentions that Simonides won 56 victories in dithyrambic contests, but there is only a single mention among the ancient sources of a Simonidean dithyramb: Strabo (15. 3. 2) refers to a dithyramb entitled *Memnon*, which was part of Simonides' *Deliaca* (possibly poems composed for the Delians). Thanks largely to papyrus finds, we have a better impression of the poems by Pindar and Bacchylides collected together as dithyrambic poems by Alexandrian editors. The remains of Pindar's dithyrambic poems (fr. 70–88 Maehler) are noteworthy for the prominence of Dionysiac elements, and this suggests a conscious acknowledgement of the Dionysiac roots of the genre. As in the case of Pindar's victory odes, there are also passages that treat the occasion of the poem and the polis that commissioned it, as well as mythic narrative (including myths that do not appear to be connected with Dionysus). In sharp contrast to Pindar's dithyrambic poems, those by Bacchylides (15–20, possibly fr. 21–22 Maehler) betray no interest in Dionysiac myth or religion, nor do they appear to give any clear indication of the occasion for which they were intended; they are simply lyric narratives of a variety of myths. It is possible that Bacchylides' poems indicate the degree to which the dithyramb had moved away from its Dionysiac roots, but it is not at all certain that these poems are in fact dithyrambic. There is little firm evidence for the criteria employed by Alexandrian scholars for classifying such poems, and there is some suggestion that the situation was anything but clear, even when scholars were working with complete texts. A scholium (P.Oxy. 2368) preserves traces of an ancient dispute between Aristarchus and Callimachus over the classification of the *Cassandra* (fr. 23 Maehler), and that debate has been echoed by modern scholars, especially concerning *Dith.* 17.

Many of the uncertainties concerning the nature and character of

earlier dithyramb arise from the fact that in the latter half of the 5th century BC the dithyramb became a favourite vehicle for the musical experiments of the poets of the “new music”. The comic poet Pherecrates provides a list of offences committed against Music by the leaders of the movement (fr. 155 *PCG*), among whom he names Cinesias, Melanippides, Timotheus, and Philoxenus. In particular, the *Persae* by Timotheus provides an extended example of “dithyrambic” style, although that poem is technically a *nomos*. A number of other extant passages give us a glimpse into the nature of a genre in which the traditional rigour of triadic structure has been replaced by astrophic form, and words have been subordinated to music. Accordingly, the emphasis seems very much to have been on the music, and there are reports of outrageous instrumental effects. Elaborate vocabulary and complicated imagery rendered the texts obscure to many, and these poets were much criticized on such grounds by later writers. In fact, the obscurity of dithyrambic poets became proverbial: “You make even less sense than a dithyramb”, runs a proverb quoted by a scholiast to Aristophanes (*Birds*, 1393). This “dithyrambic style” was regularly pilloried by comic poets in the 4th century BC.

Dithyrambs continued to be performed in the post-Classical world. There is evidence for such performances on Delos in the Hellenistic period, at both the Delia and the Apollonia, and in Athens at the City Dionysia, at least until the 2nd century AD. The fragments from this period offer no firm basis for speculation, and it is tempting to suppose that activity of the poets of the “new music” so undermined the character of the dithyramb that the genre never fully recovered.

Divination

Divination, the supposed ability to acquire knowledge of the future or of other normally inaccessible matters by supernatural means, has

always found a place in the Greek tradition from antiquity to the present day, but while some forms have enjoyed cultural approval, others have been condemned.

All the methods of divination in the Greek tradition, from the most sophisticated to the most crude, operate on the same basic principle: the belief that supernatural forces (whether gods, angels, demons, or spirits of the dead), endowed with greater understanding than humans, may reveal part of their superior knowledge through the phenomena being experienced or observed. Scholarship, following distinctions drawn in antiquity, has traditionally divided the methods of divination known in the Greek world between the “natural” or “intuitive” (those based simply upon direct inspiration in a natural or dream state) and the “artificial” or “inductive” (those involving deliberate observation, manipulation, and intervention on the part of the diviner). Such groupings, however, tend to be confusing since, even in the most apparently intuitive methods, some manipulation may be thought possible or necessary; they also impose a distinction not perceived by the great majority of actual participants, and have further been understood in different ways by different scholars. They are thus avoided here.

Oracular prophecy undoubtedly enjoyed the highest cultural esteem in the ancient Greek world. It was conducted at all manner of holy places, some of which transcended state boundaries and were highly institutionalized, although most were very local, catering to small communities and individuals. It also encompassed a broad spectrum of techniques, ranging from ecstatic utterance or frenzied behaviour to the interpretation of the rustling of leaves in a sacred tree or ripples in a sacred pool. The most famous site was probably Delphi, where Apollo was believed to speak through an inspired individual, the Pythia, but there were a number of other major oracles of similar standing, that of Zeus at Dodona for example. At these important centres a variety of complex rituals of consultation were conducted in correspondingly elaborate physical surroundings to produce the oracular response; questions were often posed by the representatives of cities and other such groups and concerned important matters of state policy and law, although individuals might also make enquiries. Another type of oracle, operating at a high cultural level and best exemplified by the tradition of Sibylline ecstatic prophecy, did not offer answers to specific questions but rather spoke generally about the future.

Closely related to oracular prophecy was the interpretation of dreams, which were taken to be inspired by supernatural powers. At some major sites, and at a great number of lesser ones, a god was believed to inspire the sick who slept there with dreams that either

healed directly or told how a cure might be effected (incubation); most notable perhaps was the shrine of Asclepius at Epidaurus. People also commonly interpreted their own dreams as predictions of the future, or else they might employ professionals who had training and access to the many textbooks of dream interpretation (*oneirokritika*) that developed over the centuries and, in some cases, incorporated material from outside the Greek tradition. Dream interpretation illustrates quite clearly the problems of drawing sharp distinctions between “natural” and “artificial” forms of divination, for although it might appear to be a purely intuitive technique, in many cases there was an obvious perception that dreams might be *induced*, either in the self or another, and the powers producing them manipulated. Related to this notion, indeed, was a whole range of other divinatory techniques that involved the inducement of inspiration. Thus in practices such as hydro-mancy, lekanomancy, and katoptromancy (where the behaviour of objects or substances in a vessel of water was observed or where, in more complex forms, a medium saw visions on the surface of water or some other shining or reflective material) it was believed that supernatural powers could be induced or forced by a diviner or sorcerer to reveal hidden knowledge; often these powers were thought to be the spirits of the dead and hence such techniques were perceived to be forms of necromancy.

Other common and highly developed methods of divination in the pre-Christian period include augury, in which the behaviour of birds was noted, and hieroscopy, in which the behaviour of sacrificial victims and, even more importantly, the formation, development, and marking of their various organs, such as the liver or shoulder blades, were observed. Also subject to interpretation were the chance utterances of people and involuntary movements of the body (such as twitching, sneezing, itching, and the like), as well as the patterns found on various parts of the body, like the palms (chiromancy). Natural signs were thought to predict coming weather, while heavenly events, from thunder and lightning to the appearance of comets and shooting stars, were believed to be very significant. From Hellenistic times the sometimes immensely complex and “scientific” technique of astrology developed under eastern influence; using observation of the regular and irregular movements of heavenly bodies, this either predicted the future or determined the most appropriate course and timing of action. Other simple, and consequently very common, techniques involved reading the pattern in which cast objects, such as dice, grain, knuckle bones, or other lots, fell, or the order in which they were extracted from a container. The point at which spinning objects stopped was believed to be revealing, for example of the identity of a thief, and significance might be derived from passages

determined by some random method of selection in written texts.

With the rise of Christianity to dominance in the Greek world, the old officially sanctioned forms of divination ceased to be culturally acceptable; most had been formally banned by the 4th century AD and gradually fell into disuse. Oracular prophecy thus almost completely disappeared as a result of the Church's need to preserve the authority of its canon, despite having enjoyed some prominence in the form of directly inspired utterance in primitive Christianity and in some heretical sects; the various types of divination related to animal sacrifice also vanished along with the sacrificial rituals themselves. But although the new Christian orthodoxy claimed that all forms of pagan divination were evil and nothing but vehicles of demonic deceit, practice at the popular level dictated that some at least would continue relatively unchanged. In the public sphere incubation, for example, carried on without interruption, churches taking the place (sometimes quite literally) of pagan shrines and Christian holy figures substituting as the source of inspiration. There is also abundant evidence throughout Byzantine times and down to the modern period that very many of the more private and individual forms of divination continued to be practised, not only at the local level but sometimes even in such places as the imperial court.

Divorce

Evidence from Classical Athens suggests that divorce was common and simple to accomplish, requiring state authorization in only a few particular cases, a situation that mirrors the concept of marriage as an essentially private matter between individual families in which the state played no formal role. We possess less evidence for areas outside Athens, but the Gortyn law codes of Crete and the apparent flexibility of the marriage bond at Sparta suggest that divorce was easily obtainable throughout Greece.

At Athens there were, broadly, three categories of divorce, the defining characteristic of each being the agent who effected the separation. First, the husband could send his wife away (*apopempsis*), an action that required no justification and so was a potential area of insecurity for women. However, it is likely that such divorces were discouraged by social and family pressures and by the convention that demanded the return of the dowry to the wife's natal family in all cases of divorce, whatever the reason. There was however one circumstance in which the sending away of a wife was compulsory on pain of the loss of civil rights (*atimia*) for her husband, that of the wife's adultery (for an example, see Lysias, 14. 28).

Second, the wife could leave the marital home (*apoleipsis*). Plutarch claims that Hipparate, the wife of Alcibiades, registered her intention to divorce her errant husband with the archon (Plutarch, *Alcibiades*, 8), suggesting that Athenian women lacked the requisite authority to effect a divorce personally and so, unlike their husbands, required the ratification of the state. The evidence for wives initiating divorce is problematic, however, since no other text describes such an event, although Euripides, in the context of the possibility of a woman leaving an unhappy marriage, suggests that divorce brought women a bad reputation (*Medea*, 236–37), while the children of a marriage belonged to their father and remained in his household, perhaps

another disincentive for wives to seek divorce.

The third and perhaps most common category of divorce was that of *aphairesis*, the dissolution of marriage by the wife's natal guardian (*kyrios*). A woman's father and brothers had the right to insist upon her divorce and the return of her dowry, and the reasons that motivated them to do so highlight several functions of marriage in antiquity (and beyond). Childlessness is attested as a reason for divorce and the wife who did not provide her husband with heirs faced being sent back to her father's house. However, two lawcourt speeches voice a concern for the wives of infertile husbands; in one a husband unselfishly asks his wife's father to retrieve her and remarry her to another man so that she might have the chance to bear children (Isaeus, 2. 7–8), while in another a speaker criticizes the brother of a married but childless woman for not effecting her divorce and finding her another husband (Isaeus, 8. 36). The fate of the adulteress, compulsorily divorced, reflects too upon the notion that the primary purpose of marriage is the provision of legitimate children; the seduced woman can no longer be relied upon to fulfil this wifely function and so must be dismissed.

Marriage was important too as a site for social and interfamilial alliance, engendering and cementing kinship ties between and within families. Conversely, when conflict arose, divorce could result (Demosthenes, 4. 4), while social and financial ambition could also lead to the dissolution of an unprofitable marriage; in one text a daughter begs her father not to divorce her from the husband she loves to marry her to a richer man (Menander, Papyrus Didot 1). The case of the *epikliros* is particularly instructive here. The estate of a man who died without sons could be claimed by his nearest male kin, who was constrained also to marry any daughter of the deceased, the *epikliros*, who thus pertained to the estate. Such claims were legally adjudicated in a special court hearing (*epidikasia*). Significantly, a married woman who became an *epikliros* was divorced from her present husband in the interests of inheritance and the production of legitimate heirs for her natal family and thus, as the speaker in a 4th-century BC court case insists, “many men are deprived of their wives” (Isaeus, 3. 64).

Such pragmatic concerns about the legitimacy of children and socio-economic factors continued to inform marital alliance and separation in the Hellenic world, but the new perspective on marriage introduced by Christian teaching produced a pronounced change in attitudes to divorce. While the early Church's view on wedlock was divided, on the whole it promulgated the sanctity of marriage which thus was accorded an extra religious dimension and status. Furthermore, in marked contrast to the easily dissoluble marriage ties of antiquity,

Christian marriage was regarded as a bond for life, and divorce was thus anathema. A further disincentive to divorce lay in the Christian notion that remarriage constituted adultery, even in the case of widowhood and especially with regard to divorce.

Dodecanese

Aegean islands

Today the "Dodecanese" (literally "group of 12 islands") includes Astypalia, Chalki, Cos, Kalymnos, Karpathos, Kasos, Kastellorizo, Leros, Leipsoi, Nisyros, Patmos, Rhodes, Symi, and Tilos, as well as a few other small islands, one or two of which are inhabited but do not have independent (deme) status. That is a total of 14 islands. The original 12, which included Ikaria but excluded Rhodes and Cos, got their group status following a collective protest in 1908 at the proposed removal of privileges which they had enjoyed from the Ottoman authorities since the 16th century. These were taxation at a modest level and by community not by individual, and freedom from

the permanent presence of Ottoman officials. The very importance of Rhodes and Cos was of course the reason why they were, from the start, excluded from privileged status. In fact the term “Dodecanese” was used as early as the 12th century AD but in a quite different sense. In this article it is used with the meaning it bears today.

Although the Dodecanese are geologically, and in details of climate and fauna and flora, more closely related to continental Asia Minor than to the Aegean archipelago, and in early prehistory were close in culture to Asia Minor, from the time of the Minoan palaces (c.2000 BC) they were part of Aegean spheres of influence (which included coastal Anatolia).

Both Minoan and Mycenaean remains have been found widely in these islands and it is clear that the Dodecanese belonged, in succession, to these cultural areas. Their history in the early Iron Age and down to c.600 BC is not known in much detail but they certainly received settlers from various parts of Greece and acquired their Dorian character. The islands (especially the three cities of Rhodes – Ialysus, Camirus and Lindus) were prosperous in the Archaic period (6th century BC) and the Rhodians participated in the establishment of the Greek trading emporium of Naucratis on the Nile delta and founded colonies abroad, contributing substantially to the spread of Greek culture. In the Persian Wars of the early 5th century BC, the colonies were squeezed between the opposing sides, not least because of their geographical position. In the Classical period there were synoecisms, accompanied by the foundation of new urban centres, on both Rhodes and Cos. The smaller islands were subordinate to them and were sometimes formally incorporated into their administrative structure. Rhodes and Cos were especially prosperous and important artistic centres in the Hellenistic period, when they were subject to the Ptolemies of Egypt. Rhodian sculptors were responsible, *inter alia*, for the works in the Cave of Tiberius at Sperlonga in Italy, and played an important part in the transmission of Greek stylistic influences on Roman sculpture. After the advent of the Romans, Rhodes was punished for its support of the anti-Roman Macedonian king Perseus, and lost its economic and maritime influence when Delos was made a free port in AD 166.

When Constantinople became the capital of the Christianized Roman empire in AD 330, geography again determined the allegiance of the Dodecanese as is clear from the remains of numerous early Christian basilicas in the islands.

Dodona

City in Epirus

Dodona was the site of reputedly the oldest oracle in ancient Greece and dedicated to the worship of Zeus. Located at the head of the valley of Tsarkopvitsa at the foot of Mount Tomaros, the ancient site is 22 km south of Ioannina. In Classical times pilgrims reached the site from the south, up the valley of the river Louros to the town of Kopani. In Roman times Dodona lay directly on the inner main Epirote road heading north from Nicopolis; its centrality explains the revival in the 2nd century AD of the Zeus Naia festival and games and the establishment of a bisphoric two centuries later.

In the 3rd millennium BC Dodona saw continuous habitation in the form of primitive shepherd communities. No buildings survive from this period, although numerous stone tools, loom weights, pottery, and a clay hearth have been found. Seasonal habitation is suggested, that is, shepherds brought their herds to Dodona each summer to take advantage of the pastures, springs, forests, and cool temperatures. These non-Greek-speaking shepherds are identified in Greek tradition as Pelasgians. At the end of the Early Bronze Age or shortly thereafter, Greek-speaking peoples moved into the area, perhaps bringing with them the worship of Zeus. (Some scholars hypothesize that an original cult to the mother-earth goddess, Gaia, was supplanted by Zeus' cult; Gaia then became Zeus' consort, only to be replaced ultimately by Dione Naia, who is known from numismatic and inscriptional evidence to have shared the sanctuary with Zeus in the historical period.)

Dodona appears in both the *Iliad* and the *Odyssey*. In the *Iliad* (16. 233ff.) Achilles mentions priests called Selloi who had unwashed feet, slept on the ground, and acted as interpreters of Zeus; some scholars explain the unparalleled behaviour of un-washed feet and sleeping on the ground as indicative of an earlier Gaia cult, wherein priests strove to stay in communication with mother earth. Odysseus (*Odyssey*, 14. 327–28) travelled to Dodona to hear the will of Zeus uttered from a sacred oak tree. It is not clear from the text whether Zeus spoke from

the oak, the oak itself spoke, or the priests interpreted the rustling of the oak's leaves or the moving of its branches. Hesiod (fr. 240, 319M-W) goes further, stating that Zeus spoke through doves within the oak; this may refer to the birds' cries or to their flight. Herodotus (2. 55) mentions the presence of three priestesses, whom he calls "doves"; his silence on the Selloi suggests that the male priests of Homer had been supplanted by priestesses sometime during the Archaic period. Scholars explain the move to priestesses as Dodona's attempt to emulate the oracular practices at the more famous sanctuary of Delphi. Whatever the reason for the change, the priestesses now assumed charge of the oracle, which had come to consist of consultation by lots. (Plato's assertion in the *Phaedrus* that the priestesses underwent ecstatic trances is a fantasy.) The use of lots would be logical if the sacred oak tree, which by now would have been 600 years old, had begun to die; moreover, the oracle at Delphi occasionally resorted to the use of lots, and so Dodona may have copied that practice.

The method of consultation was quite simple. The enquirer wrote his query onto a ribbon strip of lead and folded it over three or four times. The folded lead was marked on the outside for identification purposes and placed in a jar. A priestess then pulled from the jar an enquiry at the very time that she drew from another jar one of several responses, either a "yes" or "no" answer or the name of a deity to whom proper sacrifices needed to be made. These responses may have been written on oaken tablets (thereby perpetuating the tradition of the prophetic oak), although the use of other materials such as beans cannot be precluded. Over 150 enquiries have been discovered, the majority now housed in the Ioannina Museum. Only a few enquiries dealt with state affairs; the rest came from private individuals, most of them local, who wanted to receive fore-knowledge about such matters as marriage, children, health, and employment. The lead tablets date from 500 to about 250 BC, when the oracle fell into disuse.

The city of Dodona flourished even after the oracle declined. Pyrrhus, king of Epirus, made it the religious centre of his kingdom and transferred there the mint of the Epirote alliance. With the subsequent establishment of the festival of Zeus Naia honouring the god, Dodona saw its first major building programme. Previously the site had consisted of only a small, early 4th-century temple to Zeus, a stone circuit wall that enclosed the temple and sacred oak, and a temple of Dione; in as much as the oracular cult required no elaborate structures (other than a few tables, jars, and consulting area), the sparse remains are wholly expected. During Pyrrhus' reign, the temple of Zeus was enlarged, two temples (to Heracles and to Aphrodite) were constructed, and a vast theatre was built on the hillside. The

theatre's large seating capacity (up to 20,000) can be explained only by its connection with the Naia festival. The city was also fortified by an extensive circuit wall, with towers on three of its sides. The city proper, located on the acropolis north of the theatre, is mostly unexcavated. In 219 BC the Aetolians, under the generalship of Dorimachus, invaded Epirus and ravaged the site. The site was immediately restored by Philip V, king of Macedon. The temple of Zeus was further enlarged; also erected were a new temple of Dione and, in conjunction with the festival of the Naia, a council house, guesthouse, and a stadium to the southwest of the theatre. The oracle had by now fallen silent, as evidenced by the dearth of votive offerings and enquiry tablets. In 167 BC the Romans under Aemilius Paullus sacked Dodona to punish the Epirotes who had assisted the Macedonian king Perseus in his revolt. Dodona never recovered from this destruction. A ravaging in 88 BC by troops of Mithradates VI, king of Pontus, only exacerbated the situation. The Naia did continue on, however, until at least the mid-3rd century AD. The oracle remained silent, although Roman and Christian Greek writers penned fanciful descriptions of mantic activities like the banging of bronze cauldrons or gongs and the presence of oracular springs. The Naia ceased with the establishment of Christianity.

Dorians

Ancient ethnic group

The ancient Greeks believed that the Hellenic people was constituted by the totality of various ethnic subgroups, of whom the Dorians (along with the Ionians, Aeolians, and Achaeans) were considered to be the most important. By the Classical period, various cities in the Peloponnese (Sparta, Argos, Corinth, Sicyon, Megara), Crete and the southern Cyclades (Melos, Thera), the Dodecanese (Rhodes, Cos), southwest Asia Minor (Cnidus, Halicarnassus), North Africa (Cyrene), Sicily (Syracuse, Megara Hyblaea, Gela), and south Italy (Tarentum) claimed that they were Dorian foundations on the basis of perceived similarities in dialect, rituals, customs, and common origins.

According to ancient authors the Dorians had originally lived in central and northern Greece but had, towards the end of the heroic age, migrated south to the Peloponnese in the company of the Heraclidae (descendants of Heracles); a second migratory wave carried Dorians across the southern Aegean to Asia Minor, while the period of colonization from the 8th century BC onwards resulted in the Dorian foundations in Italy, Sicily, and Libya. The tradition for the so-called “Dorian invasion” of the Peloponnese is most fully attested in the universal history of Diodorus Siculus (1st century BC) and in the early imperial work known as the *Library* which was erroneously ascribed to Apollodorus of Athens. There are, however, earlier references: in the 5th century BC Herodotus (9. 26) mentions the first (unsuccessful) assault on the Peloponnese by the Heraclidae and Thucydides (1. 12) notes the second (successful) invasion by the Dorians and Heraclidae – an event which he places 80 years after the sack of Troy – while the 7th-century BC Spartan poet Tyrtaeus (fr. 2) proclaims that Sparta was granted by Zeus and Hera “to the Heraclidae, with whom we [Dorians] left windy Erineus and arrived in the broad island of Pelops”. Despite the fact that his subject matter ostensibly deals with the premigratory phase of the heroic age, Homer (*Odyssey*, 19. 177) remarks on the presence of Dorians in Crete, alongside Achaeans, Eteocretans, Cydonians, and Pelasgians.

Although attempts were made in the 19th century to find archaeological confirmation for the Dorian invasion in the destructions of the Mycenaean palaces, it is now generally believed that the collapse of the palatial system was due to natural disaster, internal conflict, or economic failure rather than to external enemy action. Furthermore, apparent innovations in cultural forms and artifacts that were once attributed to the arrival of the Dorians (e.g. iron working, protogeometric pottery, cremation, burial in cist tombs, and new types of weapons and jewellery) have proved to be either earlier than the palatial destructions or first attested in areas such as Attica and Euboea which did not claim to be Dorian.

Similar scepticism concerning the tradition has recently been

expressed by linguists who note that while the “Doric” dialects spoken in various cities share certain structural correspondences, no single linguistic innovation can be isolated that is not also found in at least one other non-Doric dialect and that therefore the Doric dialects need not derive from one proto-Doric idiom once spoken in central or northern Greece. In addition some Dorian cities seem not to have used the Doric dialect: by the 5th century BC, Halicarnassus was apparently employing the Ionic dialect for its official inscriptions.

Thucydides (6. 4. 3; 6. 5. 1) implies the existence of recognizably Dorian customs, though these are not explicitly identified. They may have concerned issues of constitution, law, political subdivision into the three “Doric” tribes of the Hylleis, Dymanes, and Pamphyloi, calendars, and religious festivals (for example, the festival of the Carneia), but it is far from clear that such customs were universal to all Dorian cities. Similarly, despite its origins in Corinthia, there is no reason to regard the “Doric” order of architecture as exclusively Dorian; the same is true of the “Doric” mode in music. Finally, various versions of the tradition appear to attribute to the Dorians different ancestors (Dorus, Aegimius) and different primordial homelands (Doris, Hestiaeotis, Thessaly, Macedonia) which might suggest that the legend of the Dorian invasion was in fact a compilation of earlier traditions that evolved towards the end of the Dark Age.

The earliest mobilization of Dorian identity for extrapolitical purposes would appear to be the Dorian Hexapolis – a league which, according to Herodotus (1. 144), was centred on the sanctuary of Apollo Triopios on the Cnidian promontory and which included the Rhodian cities of Lindus, Ialysus and Camirus together with Cos, Cnidus, and Halicarnassus (later expelled). If, as seems likely, the league was a Dorian response to the Ionian Dodecapolis (centred on the Panionion at Cape Mycale), then its origins should date back to at least the beginning of the 6th century BC. By contrast, Herodotus’ account of Cleisthenes of Sicyon (5. 67–68) seems to imply that appeals to Dorian ancestry in the Peloponnese may have been restricted to the ruling elites.

In the 5th century BC appeals to a collective Dorian identity became more frequent in mainland Greece, particularly at Sparta whose evocation of Dorian kinship served to justify its intervention in the central Greek region of Doris in 457 BC (Thucydides 1. 107). The exploitation of Dorian solidarity reached its apogee, however, in the course of the Peloponnesian War as Sparta employed the motif of common kinship with its Peloponnesian and Sicilian allies in opposition to Athenian appeals to an Ionian heritage: on several occasions, Thucydides has his Spartan or Syracusan speakers contrast the freedom and courage of the Dorians with the enfeebled slavishness

of Athens' Ionian allies (e.g. 5. 9; 6. 77).

From the 4th century BC onwards fewer appeals were made on the basis of Dorian identity, although renewed interest in Dorian origins accompanied the emperor Hadrian's foundation of the Panhellenion in AD 131/32 when adduced proof of being a Dorian foundation was frequently the prerequisite for admission into the league (both Cyrene and Synnada in Phrygia guaranteed their admission by these means). In the same period, Sparta attempted to revitalize its prestige by capitalizing upon its earlier status as an archetypal Dorian city and reviving its ancient customs in an archaizing form (including a "hyperdoricization" of its dialect). In general, however, the ethnic, cultural, and religious connotations of the term "Dorian" became gradually less significant compared with the linguistic definition as grammarians sought to identify a literary Doric dialect (alongside Attic, Ionic, and Aeolic) on the basis of the Doric idiom employed by earlier poets such as Tyrtaeus, Alcman, and Pindar. While the Dorians have figured prominently in the historiography and ideology of western Europe (particularly among German romantics of the 19th century and later the Nazi party), their role within the Hellenic tradition has been less significant, although it is often claimed that the modern dialect of Tsakonian (spoken in the northern Parnon range of the eastern Peloponnese) attests linguistic archaisms that find parallels with the ancient Doric dialect of Laconia.

Dowry

In antiquity, dowry in the form of money, goods, livestock, or land represented the bride's family's contribution towards the establishment of the new household and, while not legally obligatory, was a normal and expected element of prenuptial negotiations, fixed at the time of betrothal. Indeed, since marriage was a private matter between individuals, the provision of a dowry was one indication that a sexual relationship was equivalent to marriage (Isaeus, 3. 78). Dowry was an important expression of social standing and wealth; at Athens in the Classical period dowries for women from rich families could amount to 5–10 per cent of the paternal estate, while for poorer families the proportion of the family property may have been greater still. Dowering the females of the family could represent an onerous financial burden, especially where there were many daughters, and the system may have contributed to the ancient practice of selective female infanticide (Golden, 1981, suggests a 10 per cent rate of female infanticide for Classical Athens). Nevertheless, particularly where women had little if any financial and legal power, dowry was an arrangement that worked to protect women's interests within marriage and to maintain links with their natal families; as such, it must be distinguished from the giving of "bridewealth" where the groom pays money to the bride's family.

Athenian women did not themselves take possession of their dowries; dowry was given by the bride's guardian (*kyrios*, usually her father or brother) to her husband and he administered it, dowry being essentially a transfer of property from *kyrios* to *kyrios*. Yet this transfer was, crucially, conditional; the husband's control of the dowry depended upon his continuing control and support of his wife and, if the marriage failed, the dowry was returned to the woman's original *kyrios*. The return of dowry on divorce was compulsory, including those cases when the wife's natal family instigated the separation and even when divorce was enforced legally upon a husband by his wife's adultery. Failure to return dowered property constrained the husband to pay interest on the original amount at a rate of 18 per cent per annum and failure to do this could result in a legal prosecution. In the

case of large dowries, a mortgage (*apotimimia*) equivalent to the value of the dowry was a common prerequisite to ensure repayment in the event of divorce. The destination of the dowry in the event of the death of either spouse depended upon the existence of children: if the wife died childless, her dowry was returned to her father; if the husband died childless, his widow was returned together with her dowry which could be used to redower her for a second marriage. If there were sons, however, they inherited their mother's portion (*metroia*) when they reached the age of majority, yet were obliged to maintain her for life.

A returnable dowry had several important implications. First, it reduced the likelihood of husbands divorcing their wives for trivial reasons and perhaps provided them with a financial incentive to treat their wives well; several texts attest to the power over her man that a large dowry could confer upon a wife through the threat of divorce (Menander, fr. 333 Koerte; Plato, *Laws*, 774c–e). Second, a widowed or divorced woman could return to her father's house with her dowry as a means of support, while the same property in the form of a second dowry could provide an opportunity for remarriage, a frequent occurrence in antiquity. Indeed, the role of the dowry system in the protection of women's interests in marriage is recognized by a legal speech from 4th-century BC Athens which suggests that the rich man who marries a poor girl ought to provide a fictitious dowry that he would be obliged to return in the case of divorce (Isaeus, 3. 35–36). Thus in a society such as Athens, where women did not inherit, dowry can be seen as a daughter's share in the household patrimony, the counterpart of (although not equivalent to) a son's inheritance and, as a form of security, a maintenance fund that attached to a woman throughout her life and which her sons would inherit.

In later Hellenic societies dowry retained its importance within the marriage contract, yet its uses underwent subtle changes. Where women exercised greater financial control, they are found disposing of and bequeathing their dowries in the form of a maternal inheritance, for example, in Hellenistic Egypt, where a daughter's dowry could equal a son's inheritance and could be provided by mothers as well as fathers, taking the form of money and personal property, although not of land. One Alexandrian marriage contract from 92 BC in which the dowry settlement is the crucial component insists that, if the wife voluntarily leaves the marriage, her husband must return her dowry within ten days and, failing this, must forfeit the amount plus one half (Tebtunis Papyrus 104). In the Byzantine period bridegrooms contributed an amount equal to that specified in the bride's dowry contract (*proikosymbolia*) and, while husbands administered the marital funds, the alienation of their wives' dowries was subject to

Dreams

Dreams had begun to be used for divining the future already in ancient Mesopotamia and Egypt. Indeed, the Greeks may well have borrowed from these two great civilizations. The earliest Greek dream on record is Agamemnon's in book 2 of the *Iliad*. It is a false dream sent by Zeus counselling Agamemnon that he will achieve victory if he launches an immediate all-out attack on the Trojans. Homer describes this as an *oulos oneiros*. Although scholars have always translated this as "destructive dream", the adjective *oulos* could also mean "woolly" or "kinky". In the *Odyssey* (book 19) Penelope explains that there are two kinds of dreams: those that come down to mortals through a gate of ivory are false; those that pass through a gate of horn are trustworthy. One speculative commentator ventured that this symbolism arose because ivory is always opaque while horn, if sliced thinly and polished, can be translucent.

The dream in Homer was generally conceived as a personified force that travelled from the realm of the gods to the beds of humans. This view was debated in the Classical period as can be seen in Herodotus' account of the dreams that came to Xerxes, encouraging him to attack Greece. Convinced that these dreams were sent by the gods, Xerxes persuaded his adviser, Artabanus, to impersonate him and sleep in his bed to verify this momentous dream. Artabanus at first protested that dreams are purely products of the inner self: "nearly always these drifting phantoms are the shadows of what we have been thinking about during the day". Yet when he slept in the king's bed, the same dream not only appeared to him, but recognized him as the king's adviser and threatened to burn out his eyes with iron rods if he did not approve the plan to wage war. In later historical periods dreams came to be viewed more as internal states. Although grammatical gender does not necessarily reflect a real-world perception of animateness, it is interesting to note the sex change undergone by the word for dream. It began as a neuter form *to onar*, developed a personified masculine form *ho oneiros*, freely alternated for a long while between masculine and neuter forms, but then exclusively assumed the neuter noun form – *to oneiro* – that it possesses today.

The recognition that dreams were products of the human imagination did not exclude the possibility that they could also be prophetic. Aristotle addressed just this question in his tract *On Prophecy in Sleep* where, like Artabanus, he sceptically contended that dreams were just representations of personal wishes or stimuli felt during sleep; they could only be prophetic in minor ways such as predicting the onset of illness in the dreamer. Dreams were, indeed, embraced as a diagnostic tool by the Greek medical tradition as attested by the Hippocratic texts and by Galen.

Aristotle's sceptical views notwithstanding, the general population continued to hold that dreams could be interpreted to forecast the future. Artemidorus' 2nd-century AD text, *The Interpretation of Dreams*, attested to this public conviction. Artemidorus was a professional interpreter of dreams and the latter portion of his book was dedicated to his son who would succeed him. His instructions are extremely valuable for, unlike dream-interpreting keys (*oneirokrites*) that simply matched symbols to interpretations in dictionary fashion, Artemidorus explained how and why he reached his interpretations of dream symbols. Artemidorus thought it important to travel to understand the customs and cultures of the people whose dreams he was asked to interpret. He also thought that the meaning of symbols varied depending on the individual. One man reported the same dream of himself without a nose at three different moments of his life. The first time meant that he would lose his perfume business; the second time that he would be disgraced (lose face); and the third time, that he would die (since a skull has no nose).

In a gesture towards Aristotle, Artemidorus differentiated so-called "state dreams" (*enypnia*) – produced by current worries, feelings, or wishes – from prophetic dreams (*oneiroi*) that could literally or allegorically tell the future. It was only this latter category of *allegorikoi oneiroi* that required the services of a dream interpreter, although it must have been difficult for anyone to know in advance exactly which kind of dream had been had. Subsequent dream interpreters, including the 4th-century AD Neoplatonist Latin writers Macrobius and Chalcidius, proposed similar divisions of dreams into four or five classes, depending on whether they were true or false, divine or physical, interpretable or not. In denying the significance of "state dreams", ancient dream interpretation dismissed the very sorts of dreams to which Freud would later attach the most significance.

The first response of Christianity to dream interpretation was to outlaw it – a step formally taken at the Council of Ankara (AD 314). In the Christian view the future belonged to God alone to decide and reveal. Prophecy was neither an appropriate nor a feasible endeavour for lay dream interpreters to engage in. One particular cult the early Church was eager to eradicate was that of Asclepius which boasted hundreds of shrines up and down Greece. Asclepius was a healing god and one of his modes of operation was through a practice that scholars have labelled "incubation". This involved pilgrims attending these Asclepian shrines, and sleeping in the inner sanctuary. There the god would appear to them in dreams, sometimes in the form of a snake, and he would either prescribe a remedy or else directly cure the ailment. The chronically ill 2nd-century AD rhetorician Aelius Aristides presented, in his book *The Sacred Tales*, a record of the dreams he saw

and the cures Asclepius recommended he undertake.

The Church realized that it could not wipe out popular beliefs in healing dreams and so adopted a strategy of appropriation. The shrine of Asclepius at the foot of the Acropolis, for example, was converted into a church dedicated to St Andrew, patron of the sick, where people continued to practise incubation.

Dress

Dress reveals much about society and culture. Generally, the further one goes back in time, the more difficult it is to establish an accurate history of dress. Greece's climate is detrimental to the preservation of textiles, so scholars must rely on visual and written evidence to determine the dress worn in Greece before modern times.

The earliest evidence for Greek dress dates from the Middle and Late Minoan periods (2100–1150 BC). Frescos, statuettes, vases, sarcophagi, and seals from Crete, Thera, Mycenae, Tiryns, and Tanagra help historians to reconstruct a general picture of Minoan dress. Substantial amounts of gold jewellery survive, including necklaces, earrings, rings, diadems, bracelets, and belts.

The snake goddesses from Knossos in Crete are famous in dress history for their bare breasts. These figurines, made of faience, wear fitted bodices that fasten just below the bustline. Some scholars believe that only goddesses and priestesses wore such revealing bodices since other artwork shows women wearing close-fitting tunics that cover the breasts. Women of all ranks wore bell-shaped tiered skirts, curved apron-like garments that covered both front and back, and belts that cinched their waists. They wore crowns, festoons of pearls, and diadems over dark, curled tresses. A fresco of a woman with reddened lips and accentuated eyes known as *La Parisienne* makes Minoan women out to be quite glamorous. Women who participated in bull riding wore the same attire as male participants – double aprons with narrow rolled belts and protective coverings around the ankles – suggesting an egalitarianism that women in Greece have not enjoyed since then.

Men appear less frequently in Minoan art than women. Frescos at Knossos and Thera depict men wearing either loincloths or patterned loin skirts decorated with tassels in front. Sometimes men wore tunics edged with decorative bands. Men's hair, like women's, was long and curly. Some images of men, such as the *Prince of the Lilies* at Knossos, have exceptionally narrow waists, possibly a result of rolled leather or metal belts placed on their bodies in childhood. From the frescos at Thera, it appears that boys wore little more than strings around the waist, or even nothing at all. Children's heads were partially shaved, possibly to prevent ringworm. When not barefoot, Minoans wore sandals or soft pointed shoes.

Minoans had a love of colour and pattern. Clothes were decorated at the edges with patterned bands. Barber (1991) argues that the patterns were woven, but such designs could also have been embroidered or painted on cloth. Remains of a linen tunic discovered in a bronze amphora dated 1000 BC from Lefkandi in Euboea reveal edges decorated with woven and embroidered bands. Ornaments on such bands and in jewellery include rosettes, lilies, birds, saffron flowers, butterflies, double axes, bull's horns, and bees. Minoan dress reveals knowledge of sophisticated cutting and fitting that is atypical of the time. Draping cloth around the body was the norm for contemporaries of the Minoans as well as a mark of civilization. Scholars believe that among early civilizations tailored clothes derived from the wearing of skin garments which were fitted and stitched to accommodate the size and shape of skins.

After the decline of Crete and the destruction of Thera around 1450 BC, Mycenae achieved dominance over Greece. Archaeological finds from Mycenae, Tiryns, and Tanagra show that dress on the mainland was indistinguishable from that worn on Crete and Thera during the

Middle and Late Minoan periods. Mycenaean soldiers are shown wearing fringed tunics, helmets, and protective coverings for their shins. During Greece's Dark Ages the fitted bodices, tiered skirts, and loin cloths disappeared along with the elaborate patterned fabrics. By the time the Archaic period began, the Greeks had donned uncut rectangles of cloth draped on the body. The cloth came off wide, warp-weighted looms, and required no cutting or stitching for use as garments.

The basic piece of clothing for both men and women was the chiton, a tunic-like garment that fastened at the shoulders. It could be long or short depending on the wearer's gender and age. Women generally wore ankle-length chitons while active males and youths wore short ones. The chiton was draped in one of two basic ways – Doric or Ionic – so-called today because each resembled the capitals on architectural columns. The wool Doric chiton was folded over at the top and pinned once at the shoulders with large straight pins. The overfold, which often ended in a patterned band, extended to the waist. This style, termed *peplos*, originated during the Archaic period. The Ionic chiton, an innovation adopted from Ionia, had no overfold. The fabric, either linen or lightweight wool, was fastened several times at the shoulders and along the arms with stitches or small brooches called fibulae, creating a sleeve effect. Belts or loose stitching kept the garment, which was open down the side, in place. Belts with tassels apparently had a seductive quality about them. In the *Iliad* Homer tells of Hera's tasselled belt which Zeus found irresistible.

The chiton has an interesting social history. According to Herodotus, during the Persian Wars the Athenians outlawed the Doric chiton after Athenian women killed the lone survivor of a military campaign by stabbing him with the pins from their dresses. It was replaced with a foreign innovation, the softly pleated Ionic chiton. After the Persian Wars ended, the patriotic Greeks returned to the older indigenous form of dress, the Doric chiton. The Ionian style returned during the Classical and Hellenistic periods. During the Hellenistic period the chiton was belted high, creating an "Empire" waistline. The changing preferences in chitons are evident in sculpture. Artists took great pains to render the details carefully, as seen in the *Charioteer* at Delphi, who wears a long Ionic chiton, and the Caryatid maidens at the Acropolis, who sport Doric chitons.

Greeks wore a variety of wraps, most commonly the himation. In wide use by the late 6th century BC, it was almost always worn over the chiton. The most common method of draping the himation allowed the right arm to be free. Women used their himations as veils when outside the house, since respectable women would cover themselves. Other coverings included the smaller *diplox* and the

square chlamys, a cloak preferred by travellers and soldiers since it doubled as a blanket.

Male athletes sometimes performed naked, at other times in a simple loincloth. Greeks prized athletic bodies, grooming and anointing themselves with fragrances and oils. Working-class men and slaves wore a short, rectangular garment called *exomis* which fastened at the left shoulder. Both men and women wore sandals. Jewellery included necklaces, earrings, rings, and pins.

Although we know that the ancient Greeks wore coloured clothes from the paint remaining in the crevices of sculpture and from written sources, our knowledge of colour from visual sources is limited because vase painting does not reveal colour, and the pigment has worn off statues. Pliny mentioned the “flowered colours” of women’s clothes. Men and women sported a variety of hairstyles and headgear. Men were bearded with long hair during the Archaic period, but during the Classical period short haircuts and a clean-shaven look prevailed. A broad-brimmed hat called a petasus offered protection from sun or rain. The popular Phrygian bonnet, a brimless peaked cap, reappeared in the Middle Ages, and again during the French Revolution as a symbol of democracy. Women wore their hair long during the Archaic period but bound it in knots and chignons in the Classical and Hellenistic periods with bands, nets, cloth, and metal fillets to keep the hair in place.

The dress of Classical Greece has had widespread influence throughout history. During antiquity Greek dress spread to other Mediterranean areas including the Etruscan and Roman worlds. Centuries later, whenever Greek politics, art, or philosophy was ascendant, fashionable dress took on the lines, colours, and details of ancient Greek dress.

Actual garments survive from as early as the 3rd century AD to inform us about the fabrics and construction of clothing during the Graeco-Roman period. Whole tunics come from the Copts, a Christian religious sect living in Egypt who buried their dead fully dressed in the desert. Initially woven of linen on wide vertical looms, the tunic (a Roman innovation) was seamed only at the sides. With the adoption of horizontal looms, the Copts (and presumably others in the Mediterranean) started piecing tunics from narrower widths of fabric and sewing on sleeves. Skilled weavers added colourful tapestry-woven stripes (*clavi*), squares, and roundels of wool. These tunics display motifs typical of the Hellenistic period including detailed portraiture. Gradually, the motifs took on Christian symbolism or changed to Christian imagery.

Dyrrhachium

City in modern Albania

Dyrrhachium (now Durres in Albanian, Drasch in Turkish, Durazzo in Italian), situated on the Albanian coast, was founded in 627 BC by the Corcyreans and Corinthians (Thucydides, 1. 24) and remained an important port and commercial town in antiquity and medieval times; the coins of the town show a cow suckling its calf, symbolizing the dependence of the colony on the mother city. The Greeks named the town Epidamnos; but the Romans preferred the Illyrian name of Dyrrhachion/ Dyrrachium (which at first was used only for the upper part of the town), probably because they regarded the second part of the Greek name (recalling the Latin word *damnum*, “damage”) as a bad omen.

The Greek town Epidamnos had an oligarchic constitution; trade with its Illyrian neighbours soon made it so prosperous that it could afford to build a treasury at Olympia (Pausanias, 6. 19. 8). Inner conflicts in the 430s BC which then involved Corcyra (modern Corfu), Corinth, and Athens were one of the triggers of the Peloponnesian War. In 314 BC the Macedonian king Cassander took the city, but lost it soon afterwards to the Corcyreans who gave it to the Taulantian king Glaucias. In later Hellenistic times Epidamnos had the reputation of being a dissolute sea port.

As for the buildings of Greek times, several temples are mentioned in inscriptions, among them one of Athena/Minerva and another of Artemis/Diana. Only the sanctuary of Aphrodite has been excavated,

bringing to light about 6 tons of mostly late Hellenistic votive figures in terracotta varying greatly in size. Many of them wear Illyrian costume, as also do many people depicted on the numerous grave stelai found in nearby cemeteries, which are often a source for Illyrian names. Although Albanian scholars used to stress the continuity of Illyrian traditions from ancient times until today, there can be no doubt that by the 4th century BC, at the latest, the Greek element dominated the country surrounding Dyrrhachium; many centuries later, Albania's national hero Skanderbeg not only received the inspiration for his name from Alexander the Great (Skanderbeg derives from Alexander bey), but also his helmet with two horns (a copy of which is preserved) was modelled on a similar helmet worn by Pyrrhus of Epirus in 287 BC.

At the end of the First Illyrian War (229 BC) Dyrrhachium came under Roman protection. A *civitas libera* already in republican times and a *colonia* under Augustus, Dyrrhachium was important because of its geographical situation: from the 1st century BC onwards the town was the starting point of the Via Egnatia leading to Thessalonica and then on to Byzantium; it was also the usual port for ships coming from Italy (Brundisium, modern Brindisi) and therefore played a significant role in the Roman civil wars; in 48 BC Pompey had his camp there and was besieged in vain by Caesar.

Dyrrhachium's apogee came after Augustus had stabilized the Roman empire; many remains of imperial times have been found, though modern Durres, with about 80,000 inhabitants and the second largest city after Tirana in Albania, covers most of the ancient city, thus making excavation nearly impossible. In the northern part of the city the Roman amphitheatre (already mentioned in 1510 in Marinus Barletius' biography of Skanderbeg) has been excavated to reveal a typical Roman building, a very rare occurrence in the Greek east but to be explained by the settlement of Roman army veterans. Constructed during the reign of the emperor Hadrian (117–38), the huge, oval amphitheatre measures of 127×103 m (arena 63×39 m) and could seat about 15,000 spectators; people moved in and out by way of subterranean stairs and galleries, which are well preserved in places, while the animals and gladiators entered the arena through big gates in the north and south of the building; an inscription records that 12 gladiatorial fights were given to celebrate the inauguration of a new library. In the western part of the amphitheatre a little chapel was later inserted (probably in the second half of the 6th century); on its southern wall one of the very few preserved wall mosaics of the early Byzantine era (the only one in Albania, in fact) shows the Virgin Mary as queen of the heavens in imperial garb, accompanied by Michael and Gabriel, and nearby St Stephen praying. During the reign

of Hadrian a 15-km aqueduct was also built (restored by Severus Alexander 222–35) of which leaden water pipes with inscriptions mentioning the emperor and the officials in charge of the water supply have been preserved; great baths of the 2nd century AD with floor heating and sumptuous floor mosaics have been partially excavated. It is still unknown where the Greek and Roman fortifications were located.

Dyrrhachium was destroyed by earthquakes in AD 314 and 522, and in 481 it was besieged by Theodoric the Ostrogoth; nevertheless the town flourished as an episcopal see and capital of the province Epirus Nova, later a theme of the Byzantine empire.

E

Earthquakes

The Aegean region has the highest incidence of earthquakes (seismicity) in Europe. This has had an important effect on both the civilizations and the landscape of the region. Most of these earthquakes were produced by forces connected with large-scale movements of the earth's crust and mantle (plate tectonics).

Earthquakes are vibrations of the earth that are produced when rocks juxtaposed across a fault slide past each other. Some faults slide very easily, so stress on the fault is dissipated continually. However, many faults are "sticky" and the stress can build up to much higher levels before the energy is released in an earthquake. The magnitude of an earthquake (the well-known Richter scale) is not a measure of destructiveness but merely indicates how much energy is released. It varies according to the amount of movement of the rocks (from a few centimetres to several metres) and the surface area of the fault that moved (from a few square metres to tens of square kilometers). The amount of vibration felt at a particular place on the earth, and hence the local destructiveness of an earthquake, is called the intensity. It is measured on the Modified Mercalli scale and varies with location. Therefore, each earthquakes has only one magnitude but many intensities. The intensity depends on the distance to the centre of the earthquake, its depth, and the local geology. Many sediments, especially those in recently drained lakes, can amplify considerably the earthquake vibrations and increase the intensity.

Underwater earthquakes or landslides can produce extraordinary waves on the sea called tsunamis (or less correctly, tidal waves). In the open sea tsunamis are typically less than 50 cm high, travel at speeds of up to 200 km per hour, and have a wavelength of the order of tens of km: hence they are not noticed generally by people in boats. Near to the coast their character changes dramatically – as the sea becomes shallower the wave height increases to up to 50 m. Such waves can be extremely destructive in coastal communities.

The movements associated with an earthquake will generally produce changes in the height of the land across the fault of up to several metres. Along the coast these changes in height will appear as local changes in sea level. Such changes have submerged coastal cities and quarries and left harbours dry. Such local effects should be distinguished from global long-term sea-level rises caused by melting of the ice caps since the peak of the last glacial period 20,000 years

ago.

Just before an earthquake there are often changes in the environment, some of which have been used to try to predict the timing of the earthquake. Among these are changes in the water level in wells and in the discharge of springs. The general level of ground noise (very small earthquakes) may also change before an earthquake. Lastly, many people have noticed unusual animal behaviour before an earthquake. If true, this may be related to any of the effects listed above or to changing magnetic and electrical fields. As yet, there has been little success in the prediction of earthquakes.

Seismic risk can also be measured in several different ways, but the most important from a cultural point of view is the maximum intensity or destructiveness of the earthquake. The maximum intensity is much higher in some parts of the Aegean because they lie close to the edge of tectonic plates. The high maximum intensity of the Ionian islands and southwestern Peloponnese is due to the subduction of the ocean floor (albeit thicker than normal) beneath the Aegean Sea. The ocean floor has to bend in order to go down the subduction zone, and this movement causes the earthquakes. High maximum intensity on Crete and Rhodes is also related to the same plate motions, but here the direction of movement is almost parallel to the Hellenic arc (now the Ionian islands, the western Peloponnese, the islands of Crete, Karpathos, and Rhodes, and southeastern Turkey), and hence the two plates slide past each other along transform faults. A zone of earthquakes associated with a tectonic plate boundary extends from the northern Aegean through the Sea of Marmara and across northern Turkey. Most of the other zones of high maximum intensity are related to crustal extension north of the Hellenic arc: this has produced a series of approximately east–west grabens (tectonic valleys). There are still important movements on the Corinthian and Euboean gulf grabens, hence their high maximum intensity. The high maximum intensity of many of the islands in the eastern Aegean is probably related to grabens that stretch from the Aegean Sea itself deep into the Turkish mainland.

There were many earthquakes in antiquity, but few have been identified and studied in detail. The earliest has been only identified by the effects of the accompanying tsunami. This was an earthquake, or possibly a landslide, associated with the great Minoan volcanic eruption of Thera (modern Santorini) in 1650 or 1450 BC. The tsunami deposited sediments on the adjacent island of Anafi up to a height of 40 m and was still 7 m high when it reached Israel. It must also have devastated settlements on the northern shore of Crete. The earthquake of 464 BC that destroyed Sparta was an important historical event of the Classical period. It was a medium to large earthquake produced by

vertical movement on the fault at the base of the Taygetus Mountains. The earthquake and tsunami of 373 BC in the gulf of Corinth were responsible for the destruction of the city of Helice, remains of which have not been located. It was probably 7 km west of Aigion, on the western gulf. Contemporary writers noted that wild animals and insects left the city during the five days preceding the earthquake, and this has often been cited when premonitory animal behaviour is discussed. The city was submerged by movements on the fault, and its destruction was completed by the tsunami and further earthquakes along this fault. The earthquakes that toppled the Colossus of Rhodes in 222 BC caused parts of the land to rise almost 4 m, which was one of the largest earth movements in the region during the last 10,000 years. The harbour at Phalasarna in western Crete has been lifted up by over 7 m since antiquity. This must have occurred during several earthquakes, including the devastating earthquake of AD 365 centred south of Crete. The ensuing tsunami caused the loss of thousands of lives and extensive damage throughout the eastern Mediterranean. Another earthquake in AD 551 is known to have caused drastic damage further east, and may have also contributed to the uplift. A recent tsunami associated with a volcanic eruption was that of the Colombo Bank volcano in AD 1650 that produced waves 20 m high on the coast of Thera. Devastating earthquakes occurred even more recently in the Cyclades in 1956, Corinth in 1961, and Kalamata in 1986.

Ecology

Greek ecosystems go back to the Tertiary period, several million years ago, when the climate was much wetter than today and the predominant vegetation was probably evergreen forest. These subtropical "laurisylvan" forests perished in the cold, drought, and fire

of the Quaternary period, but their rustle and scent still faintly echo and breathe in the laurel and arbutus jungles on the north sides of west Cretan mountains.

Mediterranean ecology is determined partly by its history. For most of the last two million years Greece was colder and drier than it is now, the local effect of the glaciations of higher latitudes. Mediterranean-type plants retreated to favourable localities. The predominant vegetation was steppe-like grassland, sometimes with scattered trees. Forests were very local. Endemic plants – those confined to Greece – had nowhere to retreat to, and presumably sat out the glaciations on or near the mountains and gorges where many of them now grow. Significantly, very few endemics are forest plants.

Hundreds of thousands of years of cold and drought were interrupted by periods of thousands of years of climate more like the present. The present such interglacial began some 14,000 years ago. In the first half, Greece was populated mainly by deciduous trees like those of central Europe today: deciduous oaks, lime, alder, hazel, and even such a northern tree as birch. These indicate a wetter, probably less seasonal climate. From the 5th millennium BC onwards, the climate changed to approximately the semi-arid present. Middle European trees died out or retreated to unusually cold places and what are now thought of as Mediterranean plants became dominant.

The soils of Greece are varied, but mostly rich in lime. Soils come from three sources: weathering of the underlying rock; material eroded and washed in from elsewhere; and windblown dust from the Sahara. Weathering and erosion have been more active at times in the past than they are now. Erosion has washed material off hillsides and out of gullies and the resulting deposits have built up most of the basins and river deltas which are the best agricultural land. Lack of soil precludes most agriculture but not wild vegetation: many forests in Greece, and some olive groves, grow out of pockets and fissures in bare limestone.

Greece has always had browsing animals. Elephants and other great tree-breaking beasts were probably exterminated by Palaeolithic men, and do not appear in this interglacial. Deer, wild oxen, wild swine, and smaller herbivores such as hares survived into historical times. From the Neolithic onwards, people have replaced wild herbivores by domestic livestock. Each species of animal has its likes and dislikes: goats, for example, are fond of prickly-oak (despite the prickles) but will not eat pine unless they have to. How the impact of wild beasts differed from that of domestic animals is not known: we do not know how many deer there were in aboriginal times, still less what they ate.

Crete, and probably the other islands, tells a different story. It had tiny elephants, mini-hippopotamuses, and slow deer, but no carnivore

fiercer than a badger. Lacking predators, these animals would have produced a state that a modern ecologist would regard as excessive browsing. The transition after human settlement to an island dominated by sheep and goats may have had less effect than on the mainland.

Fire is a major ecological factor. Every summer there are countless wildfires in Greece, which are regarded as an abnormality and a tragedy. In reality trees and plants are combustible not by misfortune but by adaptation. They burn because they make flammable oils and resins; it is their business in life to catch fire (by lightning or otherwise) and burn up their less fire-adapted competitors. Some survive a fire by their thick bark or well-insulated growing points; others perish but come again from seed.

During the Neolithic and Bronze ages the landscape was affected both by increasing human activity and by a change to a drier climate. People grubbed out (uprooted) forests on good soils to create farmland; on the remaining roughland they replaced the native mammals by goats, sheep, and cattle. Forests retreated to places with moisture or good root penetration, being replaced by maquis or savanna. Undershrubs benefited from the changes to establish areas of phrygana. The date, nature, and consequences of deforestation are controversial, but there is no good evidence that Classical Greece was more wooded than Greece is today.

These changes had more effect on some groups of plants than others. Cliff plants were little affected. Plants requiring deep soils were almost annihilated by agriculture, which changed the balanced of the vegetation. Part of the reason why Greece is now thought of as a land of evergreen trees is that deciduous trees, especially oaks, grew on soils suitable for cultivation and were thus subtracted from the landscape: in recent decades, as cultivation has retreated, they have recovered some of the lost ground.

By Classical times the ecological changes were largely completed. Mostly the landscape looked not very different from Greece today, leaving aside urbanization, road making, and bulldozing. One important difference is the disappearance of fens, mostly destroyed in the 19th century. Another factor that the modern visitor may not appreciate is the great historic importance of woodcutting. Most Greek trees (even some conifers) sprout when felled and form coppice stools. In many areas wood was scarce, and even on cliffs trees were repeatedly cut down, and repeatedly sprouted, down to the mid-20th century.

In the last few decades, as land uses have been concentrated and intensified, much land that was once farmland or pasture has been abandoned. Woodcutting has almost disappeared: such firewood and

charcoal as are still used come mainly as a by-product from an increasing are of olives and walnuts. Greek vegetation is very resilient, and the result is a great increase in the quantity of natural vegetation. Terraces become roughland, maquis grows up into forest, rivers are lined with jungle, and savanna becomes infilled into forest. One consequence is an increase in fires, since much of the new vegetation consists of pines and other fire-promoting plants.

Economy

The modern concept of a national economy is far removed from the origins of the term itself. Modern economists have developed abstract and analytic concepts and built up mathematical models to measure and quantify economic activities. Gross national product, inflation, and levels of employment are all criteria which are used today to analyse a country's economy. Such criteria cannot easily be applied to ancient Greece, so that economic quantification often proves controversial or elusive.

The discipline of ancient and modern economists differs in many ways. Modern study of the ancient Greek economy was transformed by the publication of M.I. Finley's *Ancient Economy* in 1973. To understand the economy of ancient Greece, and to consider the economy in the Hellenic tradition, we must embrace the changing attitudes towards our understanding of the Greek economy.

The word “economy” derives from the ancient Greek term *oikonomia*. In antiquity *oikonomia* had a meaning different from that of “economy” as we understand it today. *Oikonomia* was far more closely associated with the organization and management of the household (*oikos*). The use of the word later extended beyond its strict application to the household but there is only limited evidence to suggest that the “national” economy was considered. The ancient Greeks had no developed literature on or theory of economics. Xenophon's *Oeconomicus* is concerned with running the household and estate of a wealthy citizen; his *Poroi* (Resources) discusses ways of

increasing revenue for the city, but is limited in explaining the means by which such improvements might be made. The *Oeconomicus* attributed to Aristotle is a collection of anecdotal stories about fundraising and the use of money, with minimal analysis of economic systems. Finley sought in vain for discussions and conscious theorizing about economics in ancient literary sources.

In ancient Greece the principal economy was that of the household. This was predominantly a rural economy. Agriculture was supplemented by the raising of livestock and in some areas by fishing. Other spheres of economic activity are also discernible. The Greek ideal of self-sufficiency (*autarkeia*) was aspired to but rarely achieved. Not all communities were able to provide all their own produce from their local rural environment. As a result, produce, among other things, was traded over varying distances in order to provide communities with the goods that they required. This trade existed on different geographic scales – local, regional, and international. Not all communities needed to rely on long-distance trade or had populations large enough to make demands beyond their immediate region. In this respect, Athens was exceptional among Greek communities not only for the large size of its population but also for its need to supplement its large domestic produce with the import of agricultural produce from abroad.

The primacy of the rural economy in ancient Greece appears as only one dynamic element in what is emerging as a complex picture of the economies of ancient Greece. The function of slaves and of non-slave labour, the role of money and coinage, the social behaviour and value systems of the urban elites in ancient Greek communities, the role of religion and temple economies, the importance of natural resources (mineral, geological, and timber), the dependence on maritime transport, and the significance of war, are all essential factors to be taken into account in understanding ancient Greek economies.

The ways in which the economies of ancient Greece have been approached in recent years have changed, and the different methods of analysing them have shed light on their nature. The established views of the past are being rejected in favour of more contextualized views of economic activities in ancient Greece.

Distinctive spheres of activity in ancient Greece can be labelled “economic” in so far as they related to the use of money, affected the finances and distribution of resources in the community, or dictated or involved the role of wealth. But understanding these spheres of activity is now seen as impossible unless their social, political, and cultural context is also taken into account.

Traditionally, students of the ancient Greek economy have been divided into “primitivists” and “modernizers”. The primitivists have

concentrated on the wider activities of society, paying less attention to the small minority, the elite, who have tended to dominate the surviving source evidence. The modernizers, by contrast, have tended to overestimate the importance of the elite and neglected the interaction of the numerically greater sectors of society. This polarization of approaches makes it impossible to see how all levels of Greek society interacted.

Another feature of the debate on the ancient Greek economy has been a distinction between the approaches of the substantivists and the formalists. The substantivists believe that the ancient Greek economy, while not as sophisticated and developed as the modern economy, betrays features and rationales which can be isolated and analysed independently of their sociopolitical context. By contrast, the formalists believe that the ancient Greek economy was not only less developed than the modern economy, but was embedded within society. The ancient economy can be understood only in terms of social and political relationships. Movement of goods, for instance, may not have been motivated by economic gain, but by considerations of reciprocal gift-giving.

There has been a move away from these two sets of polarized approaches towards a more comprehensive and pluralistic understanding of the ancient Greek economy. It is more accurate to speak of ancient Greek economies, since there was no monolithic Greek economy. Greece never existed as a single cellular entity but consisted of many different communities which interacted individually with the communities and peoples of the Mediterranean and beyond. The economy of ancient Greece should therefore be seen as numerous interrelated dynamic economic activities. These activities sometimes involved only some segments of or groups within a community, and at other times affected the whole community.

The central importance of agriculture to Greek communities led to the movement, often over large distances, of both essential and luxury items. Trade in grain in antiquity is a feature of political and economic history. Athens in the 5th and 4th centuries BC had developed such a large population that there was no guarantee that the large supplies of grain from Athenian territory, including the important islands of Lemnos, Imbros, and Skyros, could provide for the city. In some years a shortfall in domestic production would have signalled shortages in Athens. The demand for grain stimulated an increase in the movement of merchants to Athens. Virtually all the grain supplied to Athens arrived by sea. This ensured that the Piraeus, Athens' harbour, prospered and attracted numerous foreigners and traders. While it would be unfair to say that the economic prosperity of the Piraeus grew out of the trade in grain, the movement of staple

crops obviously provided an essential commodity to a highly demanding market. In the 5th century BC the growth of the Athenian empire had the important effect of providing considerable security for maritime transport in and around the Aegean. The loss of its empire by the end of the 5th century BC forced Athens to rely much more heavily on foreign alliances and institutional or legal reforms to regulate and control the movement of grain to the city.

For Athens, the most developed of the Greek polis economies, much more evidence exists for the use of credit and the role of banks and moneylenders than exists for any other ancient Greek community. Banking played an important role not only in financing maritime commercial enterprises but in all kinds of economic activity. Financial confidence was often entrusted to ad hoc groups of individuals who would act as guarantors of capital. Many surviving documents, the majority in the form of inscriptions on stone, provide information us about the use of security and capital.

Unlike many communities, Athens had the advantage of enormous wealth in its silver mines. The extraction of silver from the hills of Laurium provided the city with the raw material with which it manufactured its famous silver coinage, characterized by the owl stamped on the coin. The Athenian owl became a symbol of a guaranteed high-quality silver coinage. Its circulation during the 5th and 4th BC centuries was greater than that of any other Greek coin. The silver mines of Attica therefore played a huge role in promoting the economic welfare of the city.

The extraction of silver from Laurium depended on slave labour. Many Greek communities relied on unfree labour for their workforce. The very different and almost exclusively agrarian-based economy of Sparta was founded upon the peasant workers, the helots, who were subordinate to the Spartans. In Athens too the slave labour force which worked in the Laurium district was an essential part of the mining economy. Slaves played an important role in other areas of life. In Athens, however, it is less than certain that all farms would have used slave labour. Unlike Sparta, with its subjugated helot workforce, the typical Athenian farm was probably a smallholding providing at least sufficient produce for the household. Slaves worked in many other areas – in industries such as shieldmaking, or in crafts such as painting pots, for example, and in construction, such as on the building projects of the Acropolis in the 5th century BC.

But the economies of Greek communities also exploited a more fluid population of non-citizens: foreigners. In Athens, resident foreigners were designated as “metics” and would pay a special tax. In other commercial centres also foreigners played an important role, such as on Delos, Rhodes, and in Corinth. It was normal that only citizens

could own land in a Greek city; foreigners were sometimes granted the right to do so, but only as a reward for services to the city. The non-citizen population of the Greek city was highly fluid and transitional. Warfare and economic depression would probably see falls in this mobile population. Some cities, including Athens, had sufficiently large foreign populations to establish foreign cults and maintain a more permanent community.

Religion and warfare were of central importance to the economies of the Greek world. Religion, centred on the worship of gods in temples, encouraged the rise of temple economies. The built temple often served as a storehouse for the wealth and dedications offered to a god. The temples of Apollo at Delphi and Athena at Athens contained vast amounts of wealth at the heights of their success. Revenue from the cities of the Athenian empire was hived off as offerings to Athena in her temple on the Acropolis, and the monies dedicated to her from Athens' allies were recorded on stones and displayed outside the temple (the so-called Athenian tribute lists). The role of the temple in the movement of wealth and as a repository for wealth which could be used by a Greek city is best illustrated by Pericles' statement of the Athenian financial reserves at the opening of the Peloponnesian War (Thucydides, 2. 13. 2–6).

One of the greatest drains on the economic resource of a Greek community, and particularly a city, was warfare. The citizens of the polis in the Archaic and Classical periods typically provided the main infantry fighting force for the army. This minimized the expenditure a community had to meet for sending out a military force. The expense of warfare put an immense strain on many communities. In the 5th century BC Athens spent more on warfare than any other city. The cost of running a navy of 100 or more ships was huge. The services that the wealthiest Athenians were required to perform on behalf of the city included trierarchy – providing for the equipping and manning of warships – which helped to reduce the cost to the city of maintaining a fleet. For many Greek cities such expenditure was impossible. The other great expense of warfare was the cost involved in building and maintaining the defences of a community, in particular the cost of building city walls. Emergency taxes were sometimes required to meet the cost of military operations; special taxes were on occasion imposed if defences were required hastily. Expenditure on civic defence was large, as was the cost of providing patrols and mobile defence forces such as cavalry. Cavalry power was often provided by the wealthiest citizens of any community; the cost of maintaining a horse throughout the year was high. Despite the dependence on the wealthy elite to defray some of the expenses of warfare, it was inevitable that many cities relied on their own finances to pay for military activities. The

use of the financial reserves of temples was central to providing money to the city.

It becomes clear that the economic organization of ancient Greek communities differed in many respects from those of a modern state. Individuals and households were essential to the shaping of ancient Greek economies. In the same way, the community depended to a large extent on the household and the individual for financial support of the city. Over time the smaller-sized community of the polis was overtaken by the much more richly endowed political systems of the kingdoms which dominate the Hellenistic period. The Roman domination of the Mediterranean illustrates the rise of an even greater power than the Hellenistic kingdoms. Despite the changing shape of the political world, the economies of the Greek communities which made up the ancient world remained remarkably consistent and dependent on the household economy and the wealth of the richer individuals or elites within the community.

Education

The poems of Homer depict aristocratic youths attending their seniors much in the manner of esquires attending the knights of the western Middle Ages. There was doubtless a similar educational purpose, both in teaching skills of warfare and in inculcating heroic *arete* (valour). Apart from the long list of the centaur Cheiron's students (which gave rise to the lost Hesiodic *Praecepta Chironis*), the tale of Phoenix's instruction of Achilles (*Iliad*, 9. 432–619) involves the employment by a father of a private tutor. His noble birth possibly foreshadows (unless it is a later ad hoc invention) a formal institution known among the aristocracy of some states in the Archaic and Classical periods, when it involved a strong pederastic element. In this institution an older man courted (in Crete abducted) a youth whom he initiated into all aspects of civic life.

Other poets too were a major early source of education for the Greeks but although they did give practical information they, like Homer himself, were regarded chiefly as teachers of ethical ideals. Although their position was assailed by philosophers (first as early as the 6th century but most notably by Plato), it survived to the end of the Classical period. Thereafter the poets were read more for their artistry. Homer's paramountcy (and longevity) is marked by the commentary of Eustathios, a 12th-century bishop of Thessalonica, which is the lengthiest commentary ever written on any ancient author.

The earliest formalized education in the Greek world was probably the Spartan *agoge* (training). Though attributed to a single early enactment, this was probably a gradual development resulting from

the need for internal self-defence by the vastly outnumbered Spartiates. By the Classical period it certainly involved the compulsory, state-run education of males from the ages of 7 to 29. Since the aim was military preparedness, it gave minimal attention to literacy and maximum attention to training for war through sport and dancing as well as mock fighting and hunting. Toughness was attained through starvation, inadequate bedding in winter, and sleeping rough (excesses of severity, such as the whipping competitions that could lead to death, belong to the Roman period). Girls were given a similar but less rigorous training. A gentler and briefer Athenian analogue was the 4th-century *ephebeia*, which gave primarily military instruction to youths who entered barracks (as at Sparta) in their eighteenth year. No longer compulsory by 305 BC, the two years of service were reduced to one in 282 BC, and thereafter the *ephebeia* became increasingly pacific. Except in Macedon, where ephebes continued with strictly military training until 168 BC, parallel institutions in other cities degenerated into young gentlemen's associations, but in places lasted until the 4th century AD.

It is not known when private group schooling came into existence. The earliest schools reliably mentioned were at Chios (Herodotus, 6. 27) and Astypalaea (Pausanias, 6. 9. 6) in the 490s BC and at Troezen (Plutarch, *Themistocles*, 10) in 480 BC. The number of schools grew throughout the Classical period even in small cities (Boeotian Mycalessus must have possessed at least three schools in 413 BC, because Thucydides [7. 29. 5] reports the slaughter by Thracian mercenaries of all the boys in "the largest one"). The early, aristocratic emphasis was on gymnastics and music, the latter constituting poetry, dancing, singing, and the playing of an instrument (by the early 4th century BC the lyre had ousted the *aulos*). It is not known if there were any schools for literacy in the early part of the 5th century, but by its end these predominated.

Most of the information known about Classical education is 4th-century BC Athenian. Boys (and girls according to the evidence of vase painting) attended – but not necessarily all of – the usually separate schools of the *paidotribes* for gymnastics, the *kitharistes* for music and lyric poetry, and the *grammatistes* for reading, writing, other literature, and arithmetic. At the end of the Classical period Sicyon introduced drawing into the artistic curriculum. Teachers were freemen, sometimes with slaves as assistants, poorly paid and held in low regard. Boys were accompanied to school by a *paidagogos*, a trusted slave responsible for behaviour and moral upbringing. Lessons were learned largely by rote and encouraged by the cane and regular public competition (Plato (*Laws*, 819b–c), approvingly mentions arithmetical games). Holidays coincided with festivals.

Higher education was provided in the last third of the 5th century BC by sophists, itinerant teachers who lectured for a fee on a wide range of subjects. Hippias' professed expertise in arithmetic, geometry, astronomy, and music is the origin of the western medieval quadrivium, while Gorgias' instruction in Sicilian techniques of rhetoric transformed prose writing and ultimately the future direction of education. In the 4th century BC Isocrates and Plato opened schools, the former to all who could pay the fee, the latter only to chosen students. Both men were influential educational innovators (Plato in part through the utopian theories of his *Republic* and *Laws*). Isocrates' aim was to produce future political leaders, primarily through rhetoric, a subject that Plato was late in allowing at his Academy, where philosophical and mathematical studies were supreme. Plato's insistence on propaedeutic courses in geometry and his use of specialist teachers may be seen as the origin of secondary education, while his scientific interests inspired Aristotle, his pupil of 20 years, to open a school of his own (the Lyceum) in 335 BC where the natural sciences were vigorously pursued.

During the Hellenistic period there was both a huge expansion and a definitive formalizing of education that extended to the introduction of examinations. Whereas Diodorus Siculus' claim (12. 12. 4, 12. 13. 3–4) that Charondas deemed literacy so important that he legislated for universal education at public expense is a muddled retrojection (to the 6th century BC, and a transplantation from Catana to Thurii that was founded in 444/43 BC), Teos, Miletus, and Rhodes now certainly received huge benefactions that made universal education (for boys) a possibility, while elsewhere schools were regularly subsidized by the municipality that itself contracted the teachers. Education for girls definitely expanded, and evidence suggests that even slaves were occasionally allowed schooling (there is firm later documentation from Graeco-Roman Egypt). All children's educational activities, including gymnastics and music, were now concentrated into a single building. The age of entry to primary school varied: the Stoic Chrysippus, who emphasized the pedagogic importance of well-spoken nursemaids, suggested three, Aristotle five, and Plato six, but seven was more normal. Writing materials were more readily available and tablets with copied exercises survive. Literacy was taught through letters, syllables, words, and finally short continuous passages that were always difficult to read for lack of word division. Memorization was still dominant. Arithmetic involved little more than counting. Secondary education was largely for the study of Classical literature under the *grammatikos*, but a general education (*enkyklikos paideia*) of mathematical subjects, astronomy, and music played a minor role. Higher education in literature, rhetoric, and philosophy was available

in many larger centres, but most of the best teachers worked in Alexandria, Athens, and Pergamum. Medicine was taught chiefly at Alexandria, Cos, Ephesus, and Pergamum.

Roman education was closely patterned on Greek: any Roman with cultural pretensions was bilingual; Roman aristocrats employed Greek-speaking tutors for their children; some if not all of the earliest Roman schools taught Greek; and the curriculum of the Latin schools was based on the Greek. The main changes in the Greeks' own education was the introduction of the study of grammar in its own right in the 1st century BC through the influence of Dionysius Thrax, the deliberate choice of an archaizing form of the language increasingly distinct from that which was spoken, and an increasing emphasis upon rhetoric. This latter involved training in often extemporaneous forensic and epideictic oratory, the analysis of numerous kinds of speeches, and the formulation of strict rules for them. During the Second Sophistic (c. AD 60–410) declamatory displays became a major form of entertainment (and tool for the recruitment of students).

Christian emphasis on God's written revelations and the need for their interpretation fostered literacy in the Byzantine world (Maximos Planudes' complaint that it was not lucrative is satirical). Despite periodic monastic attacks, pagan literature continued to form the base of secular education: its defenders claimed that it was allegorical, foreshadowed Christianity, or that its resplendent form should be imitated even if its content was rejected (see St Basil's *Address to Young Men*). Persecution for paganism (most notably of John Italos in the 11th century) was remarkably infrequent and mild. Scientific subjects, however, were not usually encouraged.

Egypt

It was from the time of the New Kingdom (1550–1069 BC) that contact between Greece and Egypt became established. By that time Egypt was already a land of great antiquity with a flourishing native civilization. Over the years the Greeks established trade and political links with Egypt. Parts of the country gradually became famous centres of Greek civilization, coexisting alongside the ongoing native culture.

After a period of internal political instability in the 7th century BC, Egypt was reunited and stabilized during the reign of the pharaoh Psammetichus I (664–610 BC). Needing economic resources to make of Egypt the great nation that once it was, he developed a large-scale policy of trade relations with the Greeks and with the Phoenicians in the Levant. One very important result was the foundation of the Greek colony of Naucratis in the Nile delta, some 80 km southeast of the later Greek city of Alexandria, on the Canopic (or Rosetta) branch of the Nile. Naucratis was an important town in antiquity, though very little of it remains today. Excavations there have produced important finds of closely datable Greek pottery. In the 6th century BC the pharaoh Amasis permitted the Naucratis to levy taxes on imports and exports from river traffic, thereby ensuring their prosperity, and the Greek historian Herodotus, who wrote about Egypt in his *Histories*, mentioned various Greek temples in the city. During the reign of Amasis, the Hellenion, a Greek shrine, was established at Naucratis

jointly by Ionian, Dorian, and Aeolian Greeks from the Greek islands and Asia Minor. The most famous native of Naucratis was the Greek writer Athenaeus (fl. c. AD 200), the author of the *Deipnosophistai* (*The Learned Banquet*), a highly important work relating supposed conversations at a fictional banquet lasting several days. It contains a wealth of antiquarian information and excerpts from a vast number of earlier, largely disappeared Greek texts. Greeks from all over the Greek world also came to live elsewhere in Egypt at this early period, many enrolling as mercenaries in the pharaonic armies.

Egypt was conquered by the Persian great king Cambyses in 526/25 BC and, though there were periods of revolt and independence, it remained an uneasy, far-flung province of the Persian empire (as such becoming a theatre of minor operations in the Peloponnesian War when Persia became involved in this Greek conflict) until the arrival of Alexander the Great in 332 BC. Alexander invaded and conquered Egypt in the course of his campaign to subdue the Persian empire. He was welcomed as an alternative to the hated Persian rule. Either before or after his legendary trip to the Siwa oasis in the Western Desert, where he visited the oracle of Ammon and allegedly sought recognition as the god's son, Alexander founded his first city named "Alexandreia", on the Mediterranean coast on the western branch of the Nile delta. It is at this point that we can meaningfully begin to speak of a Greek Egypt, although Alexander did not live to return there.

After Alexander's death in Babylon in 323 BC and the subsequent division of his empire, the satrapy (province) of Egypt came under the control of his Macedonian boyhood friend and later general, Ptolemy, son of Lagus. Ptolemy diverted the funeral cortege of Alexander (en route to Macedonia) to Egypt, burying the coffin first at the old dynastic capital Memphis (south of Cairo) and then in a magnificent tomb in Alexandria which later became the burial place of the Ptolemaic kings and the focus of their ruler cult. The site of the tomb has not been discovered.

Alexandria had functioned as a Greek city from soon after its foundation and, after Ptolemy declared himself king of Egypt in 305/04 BC, became the glittering capital of the Hellenistic empire, called Ptolemaic after his name. Over time Alexandria replaced Athens as the greatest city of Greek culture. The city was endowed with splendid buildings aligned on a grid system with wide thoroughfares, and it was proverbially wealthy in the works of contemporary authors. The Ptolemies actively encouraged Greek immigrants to Egypt. Many were merchants lured by the economic prospects of Alexandria (which soon became a great trading centre); others were professional soldiers given ownership of allotments of land (known as cleruchic land)

throughout Egypt in return for their military service. The early Ptolemies actively fostered the development of the famous library of Alexandria, to which we can credit the preservation, copying, and transmission of much ancient Greek literature, and the Mouseion (literally “the shrine of the Muses”), a residential study centre for scholars which acted as a magnet for the greatest Greek writers and thinkers of the day.

Greek cities, many with Ptolemaic dynastic names such as Ptolemais, or Greek theophoric names such as Apollinopolis, grew up throughout Egypt. Important collections of Greek documents written on papyri (a writing material made from joined strips of the papyrus plant, native to Egypt and used for native Egyptian hieroglyphic writing for millennia) attest to a vibrant Greek lifestyle in many provincial areas of Egypt. The desert environment of much of Egypt is ideal for the preservation of papyrus, although little remains from the city of Alexandria or the rest of the Nile delta because of its comparatively moister climate. The Zenon, Tebtunis, and Oxyrhynchus collections of papyri, to name but a very few, have greatly increased our knowledge about the Greek way of life in Ptolemaic Egypt, and the interaction between Greeks and Egyptians, a very important subject for the question of the Hellenization of Egypt. Occasionally the papyri contain political insights, and fragments of hitherto lost Greek literature, most notably large sections of the plays of the 4th-century BC Greek comic poet Menander of Athens (which attests to his considerable popularity in Egypt). There are also private letters, wills, contracts, marriage agreements, and financial accounts, written both in Greek and in the native language known as demotic, with the result that we know much more about the private lives of the Greeks living in Ptolemaic Egypt than we do about Greeks elsewhere in the Hellenistic empires. It appears that the Greeks remained largely Greek, although many native Egyptians tried to assimilate themselves by learning the Greek language, and adopting the veneer of a Greek way of life in order to ascend the social and professional ladder. Archaeology shows that Egyptian decorative motifs were adopted by Greeks living in Egypt from early on, but these tended to be grafted on to identifiable Greek structures. The current excavations in the harbour of Alexandria may well extend our knowledge in this area.

Ptolemaic Egypt grew into arguably the most powerful of the Hellenistic empires in the 3rd century BC. At that period it was characterized by good kings and relatively stable government, and the development of the most powerful ancient navy of all time under Ptolemy II Philadelphia (ruled 285–246 BC) meant that Ptolemaic Egypt became a major player on the Mediterranean stage. Its navy took on the protection of the Greek islands against the scourge of

pirates in the Aegean (attested through honorary inscriptions at Delos and elsewhere). Egypt also established hegemony over Cyrenaica (which had been colonized by the Greeks since the 7th century BC) and Cyprus, and developed a flourishing commercial relationship with the independent Greek island of Rhodes. Military outposts were established in several places, and Egypt was always an active observer of, if not always an active participator in, political events in Greece and Asia Minor. There is evidence of some involvement against the Macedonian Antigonid kingdom in mainland Greece, and several wars were fought in the 3rd and 2nd centuries BC against the Seleucid empire of Syria over the area known as Koile ("Hollow") Syria, roughly the area we consider as the Levant, or Middle East.

Greek relations with Upper Egypt (the area known as Nubia) were not always happy, and native revolts and even temporary secession are attested at the end of the 3rd century BC. Perhaps as a means towards internal cohesion, the Greek kings allowed, or possibly ordered, themselves to be depicted in Egyptian garb in statues and temple reliefs for native consumption, many examples of which exist today. Several took pains to foster the ancient native religion of Egypt and generously endowed various non-Greek cults and temples, such as those of the Apis bulls at Saqqara, near the old dynastic capital Memphis. During the Ptolemaic period, huge temples very much in native style were built at Kom Ombo (Ombos in Greek), Edfu (Apollinopolis Magna), and Dendera (Tentyra), and Ptolemy V had a coronation ceremony in which he was crowned pharaoh, a fact to which the famous Rosetta Stone refers. Ptolemy I is usually credited with the creation of the hybrid cult of the Graeco-Egyptian god Sarapis, perhaps intended to appeal to both nationalities, who was worshipped at important shrines at Memphis and Alexandria. Still, it appears that the Greek kings remained very much Greek in their upbringing, outlook, and personal behaviour, and the ancient evidence attests that the last Ptolemaic ruler, Cleopatra VII, was the first monarch to speak native Egyptian. From the time of Ptolemy II, the kings with a few exceptions (i.e. marriages to politically useful Greek princesses from other Hellenistic empires) practised brother-sister marriage, and this remained the norm until the end of the dynasty. As a result, the family line remained Greek, despite occasional evidence of adulterous liaisons.

In common with the other Greek empires of the east, the Ptolemaic dynasty could not ignore the growing might of Rome, which from the 2nd century BC onwards gradually incorporated the Hellenistic kingdoms into its own territory. Roman power was invoked on one or other side of disputing Ptolemies, and by the beginning of the 1st century BC the Greek throne of Egypt was secure only through the

intervention of Rome. After her famous liaisons with Julius Caesar and Mark Antony, and the defeat of her forces and Antony's by Octavian (later to be Augustus, the first emperor of Rome), Cleopatra committed suicide in 30 BC and the Ptolemaic dynasty ended. Her sons by both Romans were soon killed. Egypt passed into the possession of Rome and soon became the personal property of the Roman emperor of the day, governed for him by an equestrian prefect.

The Greek population of Egypt, however remained and carried on with their lives much as they had always done, with the exception that there was now a foreign overlord. But Greek language and administrative procedures were retained for another 300 years. The flourishing economy created by the Ptolemies over centuries meant that Egypt's prosperity was a jewel in Rome's crown, and the huge grain ships which sailed from Egypt every year were a vital source of food for the Roman people. Alexandria grew into one of the largest cities of the Roman empire, and continued the tradition of Greek scholarship (both pagan and Christian) championed by it since the 3rd century BC. At the end of the 3rd century AD Egypt passed into the control of the Greek Byzantine empire based in Constantinople, but it was too far away from the political centre for much effective involvement on the part of the imperial government.

Eleusis

City in Attica

The most important town in ancient Attica after Athens and the Piraeus, Eleusis is located 24 km northwest of Athens on a landlocked bay and at the head of the fertile Thriasian plain, in antiquity the region's main wheat and barley grain producer. In Greek mythology the Thriasian plain was the first to be sown with seed and to yield crops. Eleusis was strategically placed, as it lay opposite the island of Salamis and at the junction of the trade routes from Attica, central Greece, and the Peloponnese. Eleusis, Panacton, and Phyle served as border forts for the western defence of Attica.

The site dates back to at least the Early Bronze Age. Current excavations have revealed on the west slope of the acropolis a small deposit of Early Bronze Age remains, Middle Bronze Age house walls, and Late Bronze Age walls; in the 15th century BC a porched hall (megaron) was built on the site of the Hall of Mysteries, the main cult site of the ancient city. The relationship between Athens and Eleusis during the prehistoric period is not clear, although Athenian legends speak of wars between Athens and Eleusis during the Late Bronze Age,

until Theseus unified Eleusis and 11 other Attic towns under the hegemony of Athens. All that can be said with certainty is that, on the basis of archaeological and historical evidence, Eleusis was subject to Athens at least as early as the 8th century BC. In subsequent centuries Eleusis grew ever greater in size and importance, thanks to its Panhellenic Mysteries of Demeter and Persephone. Eleusis was devastated in 480/79 BC by the Persians (whose breach of the walls is still evident), but was almost immediately rebuilt by the Athenians. The city enjoyed prosperity throughout the Classical and Hellenistic periods. Later on, Roman aristocrats and emperors like Hadrian built up the sanctuary. After the Sarmatian Costoboci invaded and sacked the city in AD 170, the emperor Marcus Aurelius restored the site upon his initiation (in 176 he had become the only lay person to enter the “Holy of Holies” in the sacred Hall of Mysteries). Eleusis suffered irreparable damage at the end of the 4th century: in 391 Theodosius I proscribed all pagan cults, including the Eleusinian Mysteries, and then four years later the Visigothic army of Alaric destroyed the site. Eleusis was the victim of further attacks, but this time at the hands of Christians, and was deserted in the Byzantine era, remaining so until the 18th century. Modern Eleusis is an industrial city of cement, chemical, and steel factories. The bay is home to shipbuilding, oil tankers, ship repair docks, and a naval training academy. Pollution is heavy, the traffic unbearable, and many refineries and factories are in need of modernization.

Eleusis's fame rested on the Mysteries of Demeter and Persephone, the most renowned and important of Greek mystery cults. According to the ancients, the rites were established in the 15th century BC; however, there is no firm archaeological evidence for Late Bronze Age cult activity. It is clear, though, that the rites were known throughout Greece by the time of the *Homeric Hymn to Demeter* (650–550 BC), according to which the mysteries were established to celebrate the return of Persephone to her mother Demeter, the goddess of grain. According to the legend, Persephone was raped by Hades and carried off to his underworld realm. In her grief Demeter wandered the earth, searching for her daughter. She came to rest at Eleusis, where she befriended the king and promised to teach the Eleusinians her rites and mysteries. Demeter refused to allow crops to grow until Persephone was released, and so humankind was brought to the brink of starvation and sacrifices to the gods were in danger of ceasing. Hades yielded to the entreaties of Zeus and released Persephone who, however, since she had eaten food (a pomegranate seed) in the underworld, could not be fully restored to the upper world. Thus, although Persephone could spend eight months a year with her mother, she was compelled to spend the rest of the year in the

underworld. This arrangement explains the growing cycle: during the reunion of mother and daughter, crops grow and lush vegetation spreads throughout the world, but on Persephone's return to Hades, the growing season comes to an end.

The *Homeric Hymn to Demeter* states that, after Persephone was first returned to her mother, Demeter revealed her mysteries to the leading citizens of Eleusis. Many of the sacred rites that form the essence of the Eleusinian Mysteries are not known, as disclosure of the rites was punishable by death; for a millennium and more that secrecy was preserved. (The great tragic poet Aeschylus, a native of Eleusis, was nearly lynched by an angry mob because the audience at one of his plays thought he had revealed some of the rites, while the famous Athenian general Alcibiades was condemned to death, in absentia, for conducting a parody of the mysteries.) What transpired in the mysteries may be reconstructed as follows. The cult was run by the city of Athens, although two families from Eleusis, the Eumolpidae and Ceryces, controlled the priesthood. Candidates for initiation (*mystai*) came to Athens in the early spring for the ritual called the Lesser Mysteries, the purpose of which was to prepare the candidates for initiation into the Greater Mysteries. Anyone who could speak Greek and was free of blood-guilt was eligible; the inclusion, in a Greek cult, of women, slaves, and Greek-speaking foreigners was remarkable. The *mystai* returned to Athens for the Greater Mysteries, a nine-day festival in the month of Boedromion (September/October). After six days of purification, washing, fasting, and sacrifices, a procession of priests and *mystai* left Athens for Eleusis via the Sacred Way. Stopping frequently for sacrifices, dancing, and singing, the procession arrived at night at the sanctuary. (A 35-m stretch of the Sacred Way has been unearthed near the 2nd-century ^{AD} bridge over the Cephissus river outside the city.) That night in the Hall of Mysteries the *mystai*, about 2000–3000 strong, were initiated into the mysteries and became *epoptai* ("those who have seen"). The ritual probably included a sacred meal, the revealing of the sacred objects of the cult, a re-enactment of the story of Demeter and Persephone, and dancing and sacrifices. Ancient sources relate that the *epoptai* were guaranteed a better life on earth and the promise of an afterlife. *Epoptai* could participate in the ritual as many times as they wished, and many did because of the intensely emotional spiritual experience. The personal communion with a deity, the promise of immortality, and the intensity of a shared bond with other worshippers made the mysteries a sharp contrast to state cults. The mysteries fulfilled spiritual yearnings in ways that mythology, legends, and official cults could not.

The archaeological remains at Eleusis are connected for the most part with the mysteries. The entire site is enclosed by magnificent

fortifications from the Archaic to late Classical periods; the west wall, with its round and square towers, is perhaps the finest example of 4th-century BC fortification. The sacred precinct, lying on the south slope of the acropolis, was entered through two propylaeas: the Greater Propylaea, built by Marcus Aurelius in imitation of the Propylaea on the Athenian Acropolis, and the Lesser Propylaea, erected in the mid-1st century BC by the Roman aristocrat Appius Claudius Pulcher and his two nephews. Just inside the sanctuary, to the immediate right, is a cave with a small 4th-century BC temple dedicated to Hades; the cave was believed to be the entrance to the underworld. Just to the west is the Temple of Demeter or the Hall of Mysteries (Telesterion). A megaron from the Mycenaean age was built here, but it may not have had any cultic significance. The Telesterion had ten different building phases. In its final phase the hall was 56 m × 66 m, with eight tiers of seats on each side. Forty-two columns supported the wooden roof. In the centre was the *anaktoron* ("Holy of Holies"), which contained the cult's sacred objects, and the high priest's chair. Except for the doors on three sides, the walls were solid, creating a dark, mysterious atmosphere. To the west of the Telesterion are remains of the council house, a 7th-century BC hero shrine, a Roman cult building dedicated to the sun god Mithras, and a gymnasium. On the acropolis are remains from the Bronze Age and the Hellenistic period. Immense Roman bath complexes have been found around the sacred precinct and in the modern town. To the south of the ancient site are a stadium and theatre; these should be understood in connection with the Eleusinia, which were games held every fourth year (that is the third year of the four-year cycle of the Olympiad) and to a lesser extent two years later. For Athenians, the Eleusinia ranked behind only the Panathenaic games in prestige.

Eleusis may have lost its importance after its destruction in the 5th century AD, but the mysteries and the *Homeric Hymn to Demeter* continued to exert influence. The rape of Persephone proved popular in literature, and the legend and the Mysteries have attracted scholars in such fields as psychoanalysis, religion, feminism, gender studies, folklore, comparative mythology, and sociology. Moreover, the mysteries, with their promise of an afterlife and intense emotional transformative experience, tapped into the spiritual cravings of the ancient Greeks and Romans, and so paved the way for religions like Christianity and Mithraism.

Emigration

Emigration is the act of moving from one country or region to another as a place of abode. The very making of Greece was the result of emigration of Greek-speaking tribes from the north into the Greek peninsula during the Bronze Age. In the centuries between the penetration and diffusion of the Greek-speaking tribes into the Greek peninsula and its conquest by the Romans, emigration was practised as an answer to various kinds of problems: war, famine, demographic pressure, poor standard of living. Emigration, constantly present in ancient Greek society, is a complex phenomenon addressing in different sociohistorical circumstances different needs. This article covers the great migratory movements of ancient Greek history.

The first extensive emigration took place between 1125 and 800 BC. There occurred three types of emigration during this period: (a) of Greeks who had previously settled in mountainous parts of the mainland and whose development lagged considerably in comparison to the tribes who participated in the Mycenaean civilization; once the decline of the Mycenaeans set in, these mountainous Greek tribes moved to the sites of the Mycenaean acme; (b) of refugees created by the first type of migratory movement; and (c) of early colonization of the east Aegean.

During the Archaic and Classical periods emigration was almost exclusively conducted by poor citizens of the city states. The majority of peasants owned small plots of land which were often insufficient for their sustenance. The situation was aggravated by inheritance rules, which prescribed the equal distribution of land among all male heirs,

and which led to considerable land fragmentation. In addition, within the city states mechanisms of wealth transfer from the peasants to the city were also at play. In such a situation poor citizens often emigrated in search of a better life.

The character of emigration was profoundly changed in the time of Macedonian splendour. The annexation of territory in Egypt and Asia Minor by Alexander the Great gave rise to extensive emigration to these new lands. All through the 4th century BC large numbers of emigrants were drawn to the east in the hope of a career in the administration or the army, or even in the hope of acquiring land. As it was required of administrators and various officials to master the Greek language, the annexed territories offered great opportunities for career advancement to those Greeks who emigrated there.

In Byzantine times wars and the search for resources were the major causes of emigration. Invasions by enemy troops created a climate of instability in the countryside leading whole families to emigrate to areas or cities considered safe. Towards the end of the 6th century AD, when the northern borders of the empire collapsed, there was an emigration wave westwards to the Ionian islands and Italy. Although emigration was usually practised by the most needy members of the population, the economic pressures exercised on peasant households forced even wealthy peasants to emigrate. A different kind of emigration emerged just before the fall of the Byzantine empire. After the defeat of the crusaders at Nicopolis in 1396 many intellectuals fled west to Italy and north to the states of the Danube. Here Greek emigrants formed sizeable communities which later played an important role in the formation and development of the Greek nation.

Empedocles c.492–432 BC

Philosopher

A native of Acragas (modern Agrigento) in Sicily, Empedocles was a leading philosopher of his time. He is difficult to classify because of

the complexity of influences he manifests. He is at once a philosopher and a medicine man: while he constructs a rational cosmology, he also claims to have magical powers to raise the dead and change the weather. In his thought he both preserves Pythagorean religious teachings from the western Greeks and continues the scientific research of the eastern Greeks in Ionia. He accepts Parmenides' denial of coming to be, yet propounds a philosophy of natural change. Though a philosopher; he writes epic verse in a florid style; appealing to the authority of reason and argument, he also presents his theory as a revelation from the deities of Greek religion.

The most immediate philosophical influence on Empedocles is Parmenides. Empedocles adopts from him both the device of using epic conventions and diction to express his views, and some of his views as well, echoing Parmenides' own language. Most importantly, he accepts the principle that nothing can come to be from what is not. Furthermore, he agrees with Parmenides that the senses are suspect, though he ultimately accepts the testimony of the senses if they are used properly. But Parmenides seems to go on to use his principle that nothing comes from what is not to argue that there is no change at all, and that what our sense experience presents us with is no more than illusion. Empedocles, to the contrary, offers a positive account of how change is possible.

While there is no coming to be or perishing, strictly speaking, there are elements that can combine and separate to present the appearance of things coming into being and changing. The many substances of the world are on this theory mixtures of elements. Empedocles uses the simile of artists painting with a set of colours. By combining a few colours and drawing appropriate shapes with them, the painter may represent the infinite variety of things in the world. So nature produces the world with a few elements. Empedocles presents four elements, which he call "roots" (*rizomata*): earth, water, air, and fire, as combining in whole-number ratios to form compounds. For instance, bone consists of two parts earth, two parts water, four parts fire. The elements are acted upon by two forces, which he personifies as Love and Strife, or, roughly, attraction and repulsion.

The elements and forces take part in an elaborate cosmogony. At one time, in the present cosmos, the elements were separated out into concentric layers of earth, water, air, and fire, while Strife played an important role. But gradually Love comes to dominate in the world, combining the elements more and more until at last all the materials of the world are completely harmonized into a homogeneous sphere (*sphairos*) pervaded by Love. In the sphere there are no differences manifest, and hence no living things, no world as we know it. But at some point Strife attacks the sphere from the periphery and causes the

elements to separate from one another, whereupon the cosmos begins to form. This alternation between the sphere and the cosmos forms a never-ending cycle of cosmic change.

Empedocles' theory of soul is deeply influenced by Pythagorean thought. The soul falls into a body as a result of the influence of Strife. It undergoes a cycle of reincarnations in plants, animals, and humans until it is purged and purified. The evils of mortality are compounded by the shedding of blood; Empedocles compares the eating of meat to cannibalistic consumption of one's relatives. Souls may progress to higher forms of plant and animal life and eventually to human life and its highest manifestations, from which they return to the status of gods. Empedocles announces that he "goes about as a mortal god, no longer mortal, honoured by all" (fr. 112. 4–5). He seems to be claiming to have achieved a state of purity that precludes further reincarnations, one that confers on him the magical powers to which he pretends. His philosophy thus forms part of a larger religious vision. Empedocles recognizes traditional gods, but calls them "long-lived" rather than "immortal", suggesting that they are beings subordinate to the cosmic cycle who will eventually be absorbed into the sphere. In his anthropology he looks back with longing to a primitive golden age in which humans and animals lived in harmony under the rule of Love, and worship was carried on without animal sacrifices.

Empedocles' views on nature, including specific discussions of biology, influenced Greek medical writers from the 5th century BC onwards, some of whom criticized him, but in doing so recognized his influence on medical studies. His great contribution to the scientific tradition was the theory of a finite set of elements forming an unlimited number of compounds by their combinations in whole-number ratios – a theory that has become the basis of modern chemistry. His specific set of four elements became standard by the following century and remained the basic substances of physical theory in both the Greek world and the west until the beginning of the modern era. Empedocles' religious ideas became part of the Neopythagorean and Neoplatonic traditions of later centuries.

DANIEL W. GRAHAM

Biography

Born c.492 BC at Acragas in Sicily, Empedocles came from an aristocratic family which had taken part in the Olympic Games. He himself seems to have been a doctor and to have been active in politics as well as in religious and philosophical circles. He was clearly influenced by Pythagoreanism as well as by the thought of Parmenides. He wrote two poems, one physical (*On Nature*), the other religious (*Purifications*), of which only fragments survive. He died in 432 BC.

Enamel

Enamel is essentially coloured glass. When heated to its melting point, glass fuses with the metal with which it is in contact, and craftsmen have long exploited this property by decorating metal with boldly coloured opaque or jewel-like translucent enamel. It may well have been a Mycenaean invention: the earliest occurrence is thought to be on gold-relief beads from chamber tombs at Mycenae of c.1400 BC (Athens, National Archaeological Museum, Mycenae graves 88, 103). Blue enamel was fused into depressions in the repoussé-work, sometimes ringed by tiny spheres of gold.

The earliest cloisonné enamel to have survived is probably that on finger rings found in a tomb of the 12th century BC in Cyprus (Nicosia, Cyprus Museum, Kouklia Evreti grave 8/33). The design was created, and the different colours of glass separated, with strips of gold set on edge in glass disks, which were then mounted on the bezels of the rings. The fully developed cloisonné technique, in which the metal strips are attached to a metal backplate, is found on the bezel of a ring from a Minoan tomb of c.1425–1400 BC near Knossos (Herakleion,

Archaeological Museum, Sellopoulo grave 3, J 6) and on the famous Kourion sceptre (Nicosia, Cyprus Museum, J 99); however, the vitreous material on the ring may not be enamel, and the sceptre may belong to a later culture.

There is little further evidence for the use of enamel in the Greek world before the 6th century BC, when filigree enamel – glass fused to the surface of an object inside loops of decorative wire – seems to have come into fashion, with blue and green the most common colours; it remained popular during the Classical and Hellenistic periods. Between the 3rd and the 1st centuries BC small pendants to be attached to jewellery were enamelled in the round, probably by being heated and dipped in molten glass, which was almost always white.

Epaminondas

Theban statesman of the 4th century BC

Epaminondas, son of Polymnis, sprang from a venerable family, distinguished by birth but not by political accomplishments. His date of birth is unknown, but he received an excellent education in music and dance, rhetoric, and especially philosophy. During his early adult life he participated in the liberation of Thebes from Spartan occupation, but played no conspicuous role in the years of subsequent fighting. Epaminondas came to the fore in 371 BC: when at a Panhellenic peace conference he defied the authority of Sparta and its king Agesilaus. When the Spartans invaded Boeotia later that year, he commanded the Theban army. At the Battle of Leuctra he crushed the enemy by a combination of brilliant tactics and superbly trained troops, destroying Sparta's ascendancy in Greece. In its place he established the Theban hegemony, which lasted until 362 BC, and made possible Theban predominance well into the Sacred War of 355–346 BC.

Anger over Spartan policies had long alienated many of the Peloponnesian states, and the victory at Leuctra released this pent-up animosity, Elis, Arcadia, and Argos allied with Thebes in 370 BC to oppose Sparta, and Agesilaus' ineffectual efforts to disrupt Arcadia provoked a military campaign by the new allies. Epaminondas and Pelopidas led the combined army on a massive invasion of Laconia. They assaulted Sparta unavailingly, but immediately turned their attention to ravaging unspoiled Laconia. Epaminondas next led them to Messenia, which they liberated from Sparta. The emancipated Messenian helots joined the allies, and together they encircled Sparta. Epaminondas directed the building of Messene, the capital of the new polis, in 369 BC. Next year he helped the Arcadians to build their new capital at Megalopolis.

On their return to Thebes, both Epaminondas and Pelopidas were tried by envious political opponents, but won easy acquittal. Reassembling the army, Epaminondas again in 369 BC penetrated the Peloponnese, but this time his target was Corinth and its surrounding allies. Although he devastated Corinthian territory and attacked the capital, his army were unable to do the well-fortified city any real harm. He was more successful in assailing neighbouring Sicyon, Epidaurus, Troezen, and Pellene. Though hardly spectacular, Epaminondas' gains deprived Sparta and Corinth of additional allies and denied them a portion of the northeastern Peloponnese.

Epaminondas' Peloponnesian policy had achieved remarkable results in a short time, but events in 368 BC proved that his work was inadequate. Athens had concluded an alliance with Sparta the

previous year, but as yet was more of a nuisance than a threat. Of greater urgency was a serious dispute between Elis and Arcadia over the border territory of Triphylia. The two states were the warders of Sparta, and enmity between them threatened to undo all of Epaminondas' work. The quarrel also underlined a fundamental flaw in his system of alliances, from which he cannot be absolved. At the creation of the alliance, all members tacitly but actually acknowledged Theban hegemony. Yet this understanding was never formally endorsed. Nor was there any joint body or *syndrion* to resolve differences among the allies. In this diplomatic arena the Theban army was of little use, for armed intervention against any of the city states would disrupt the entire alliance. An additional fault was Epaminondas' failure to apply diplomatic pressure in order to obtain a peaceful solution to the problem. As a result, the quarrel split the alliance. Mutual and antagonistic ambitions did more damage to the united front than Sparta could ever have done. Thereafter, Epaminondas faced the relatively easy problem of Sparta and the far thornier matter of his allies.

Further diplomatic failure confronted Thebes in 366 BC, when Pelopidas won the approval of the Persian king for a new general peace, only to see its wholesale rejection in Greece. The affair ended in deep embarrassment. Epaminondas tried to recover Theban fortunes by another military expedition, this one aimed at Achaëa, but the effort was pointless, because Achaëa had hitherto neither supported Sparta nor opposed Thebes. Achaëa fell easily, but unpopular Theban measures soon goaded a strong group of Achaëans to throw off its authority. Moreover, Achaëa immediately joined Sparta, which additionally weakened the Theban position within the Peloponnese.

One of the oddest episodes of the Theban hegemony is Epaminondas' naval programme, which grew out of the Theban-Persian accord of 366 BC, and was aimed at Athens, despite the fact that Thebes had suffered virtually nothing at Athenian hands, and the project was of little strategic value to its ambitions. The Persian king subsidized the construction of 100 triremes and in 364 BC Epaminondas put to sea. At the end of the summer he returned to Boeotia without results – and nothing more is heard of his fleet.

The final crisis for both Epaminondas and Thebes stemmed from the breakdown of their system of Peloponnesian alliances. By 362 BC the Peloponnesians were at open war with one another, Theban leadership disregarded, and Spartan resurgence a distinct possibility. Realizing that Thebes had virtually lost control of the situation, Epaminondas intervened to re-establish its authority. He led an army of 25,000–30,000 men against a coalition of Sparta, Athens, Elis, and

some Arcadians, numbering some 22,000 soldiers. Epaminondas encamped at Tegea, his enemies at Mantinea in the Arcadian plain. The Spartans were late to arrive, so he seized the opportunity to attack the unprotected city of Sparta, but was repulsed. He retraced his steps without hesitation, and with his cavalry made a surprise stab at Mantinea, which also failed. Pitched battle was now the only option. He confronted the enemy south of Mantinea; and, as at Leuctra, drew up his striking force on the left with his allies on the right. Opposite him were the Spartans under Agesilaus. Epaminondas' men charged and cut through the Spartan line easily, but at the height of the action Epaminondas fell, mortally wounded. This effectively ended the battle: Epaminondas died on the field, and with him died the Theban hegemony.

Epaminondas had raised Thebes to the height of its power, but he alone could not sustain its position. The Theban hegemony proves rather that no one state could bring political unity to Greece. None the less, Cicero considered Epaminondas first among the Greeks, and most Greeks considered him the architect of the hegemony. The western intellectual tradition has uniformly held him as the model of the noble, far-sighted, and virtuous philosopher-statesman. He was also the paradigm of the cultured gentleman and man of action. A modern statue of him still stands in Thebes.

JOHN BUCKLER

Biography

Epaminondas, whose date of birth is unknown, came from a noble Theban family and received a good education. In 371 BC he represented Thebes at a Panhellenic peace conference at Sparta and made his mark by defying Sparta's king Agesilaus. Re-elected a Boeotarch, he led the Thebans at the Battle of Leuctra which destroyed Spartan supremacy and established Theban hegemony. He was killed in the Battle of Mantinea in 362 BC and Theban hegemony of Greece died with him.

Ephesus

City in western Asia Minor

Ephesus, which became the greatest city of Asia Minor, was a centre of Hellenism for over 2,000 years. According to tradition it was

founded by Androclus, son of the king of Athens, in the 10th century BC. He chose a defensible site on a gulf near the mouth of the Cayster river. Ephesus thrived as an independent city through the Archaic period, becoming a centre of the Ionian renaissance. It adopted the worship of a local goddess identified with Artemis, whose images and priests, however, retained distinct local characteristics. Her first temple was destroyed by the Cimmerians in the 7th century BC.

Croesus of Lydia conquered the city in 560 BC, and moved its inhabitants to a new site near the new temple of Artemis, which he adorned with elaborate columns. Despite its incorporation into the Persian empire in 547 BC, the city retained considerable autonomy and flourished as a centre of Greek culture. Its most famous sons were the philosopher Heraclitus and the satiric poet Hipponax.

Ephesus supported the Ionian revolt of 499 BC, and in 478, now independent, joined the Delian league, where its high tribute marked it as one of the richest members. The Persians took it again in 387 BC, and held it until its capture by Alexander the Great in 334. Alexander made generous gifts to the temple of Artemis which had been burned in 356 BC, on the night when he was born. The new temple, built on an even grander scale, was soon recognized as one of the seven wonders of the ancient world. It functioned as a financial centre, and had the right of asylum.

Because of silting of the harbour, Lysimachus, who controlled the region from 287 to 281 BC, moved the city to a new site, where it flourished until the Middle Ages. The new Ephesus had a rectangular street pattern, with a great theatre and agora in the centre. The major remains of his work are the massive fortifications, 10 km long. Ephesus was subsequently ruled by the Seleucids and Pergamum until it became Roman in 133 BC. Despite joining Mithridates in 88 BC, the city remained a major centre, receiving the visits of Cicero and Mark Antony, who made a dramatic entrance in the guise of Dionysus.

Ephesus reached its height under the Roman empire, when it was the residence of the proconsul of Asia (the most famous was the future emperor Antoninus Pius), and seat of the imperial cult. Surviving remains illustrate the growth that made it one of the three largest cities of the eastern half of the empire. They include four huge gymnasia, the theatre, stadium, agora, library, civic centre, temples, lavish houses, and streets paved with marble and lined with colonnades. The greatest monument was still the temple of Artemis, on the ancient site. Building activity was most intense in the 2nd century AD.

By that time, Ephesus had become a centre of Christianity and home of some of its most sacred sites. St Paul visited in a famous and well-documented scene (Acts 19). An ancient tradition had St John and St

Timothy buried here and a legend associated the last years of the Virgin Mary with the city.

Although a Gothic attack in AD 262 destroyed much of the centre, late antiquity brought revival and continuing prosperity. The Roman city was maintained but transformed. Temples were destroyed and used as quarries, churches were added to the urban fabric, and bazaars grew up along the colonnaded streets. Mosaics and wall paintings produced a colourful impression. Ephesus took on a distinctly Christian appearance, most notably in two great churches. St Mary's, built into the ruins of the precinct of Hadrian's temple, was the seat of two church councils, the Third Ecumenical Council of 430 which established the adoration of the Virgin, and the so-called Robber Council of 449, not recognized by the Orthodox Church. These meetings brought an influx of visitors and widespread public disturbance as the various doctrines were debated and fought over. The church of St John, built over the apostle's tomb on the hill above the temple of Artemis, was rebuilt in the 6th century on a grandiose scale by Justinian I. It soon became the seat of the metropolitan bishop, and the goal of pilgrims from every part of the empire. The 5th century had added another holy site, the tomb of the Seven Sleepers, youths who had survived persecution by miraculously sleeping for 200 years. This, too, became a goal of pilgrimage.

Large parts of the city were destroyed in the early 7th century, probably by the Persians. They were followed by the Arabs, who occupied it in 654. Ephesus never recovered. The medieval city was confined to a small part of the ancient centre, surrounded by new walls built from the remains of earlier buildings. Although this site had remained an important port and seat of a large regional fair, silting of the harbour caused the centre to shift to the heavily fortified community around the church of St John by the 11th century. Consequently, medieval Ephesus is usually called Theologos, a title of the saint. Pilgrims continued to visit the apostle's tomb through the Byzantine period, especially to collect the sacred dust, or manna, that issued from the tomb and supposedly had miraculous powers.

Byzantine (and Hellenic) Ephesus flourished for the last time under the Laskarids (1204–61) when it was an important centre of education and home of the greatest scholars of the time. The Turkish conquest of 1304 introduced a period of renewed prosperity, the greatest since the 6th century, but Ephesus was now a Turkish city. The Greek population rapidly disappeared or was converted, and the church of St John became a mosque. It was finally destroyed in civil wars in the early 15th century. In the Ottoman period, only a few Greek Christians remained in a declining town that suffered from malaria and nomadism. The arrival of the English archaeologist John Wood in

1863 introduced a period of revival. His discovery of the temple of Artemis was the prelude to the extensive excavations that the Austrians have been carrying out successfully since 1895, revealing the ancient city.

Ephorus

Historian of the 4th century ^{BC}

Ephorus was a major historian of the 4th century ^{BC} who came from Cyme in Aeolis (Asia Minor). The tradition is unanimous that he studied at Athens under Isocrates, and in fact the surviving fragments and that part of the text of Diodorus Siculus that is based on Ephorus (Ephorus' own works are all lost) preserve an unmistakable Isocratean flavour. Equally in evidence is a strong admiration for Athens. Apart from his main work, the *Histories*, we hear, *inter alia*, of a local history of Cyme, a book on literary style, and one on discoveries.

The *Histories* were a general, or universal, history from the Dorian invasion up to Ephorus' own day that, while concentrating on the Greeks, tried also to include the actions and achievements of non-Greek people, to the extent at least that these impinged on Greece. In this respect he was following in the footsteps of Herodotus rather than Thucydides; and not only in this, but also in his broader interpretation of history and its scope. For instance, two whole books were devoted to geography, and in the early books necessarily, but in the later historical books as well, whenever appropriate, he related much that was known in the 4th century ^{BC} about Greek colonization and the foundation of cities (reputedly an Ephoran speciality), ethnology, religion, culture in general, and science. According to Polybius, Ephorus was the only historian (apart from himself of course) to have attempted a universal history. Herodotus had been inspired to write what he did by the titanic clash between east and west, Europe and Asia, Greeks and barbarians (led by Persia), which culminated in the crossing of Xerxes from Asia to Europe in 480 ^{BC} where he met with defeat and disgrace. The unification of Greece under Philip of

Macedon and the reverse crossing of Alexander the Great from Europe to Asia in 334 BC, which resulted in the conquest of the Persian empire, a stupendous event, would appear to have provided Ephorus with his main theme: he had intended to cover the period of Greek (and related barbarian) history from the return of the Heraclidae (the Macedonian royal house claimed descent from Heracles) in the 11th century BC to 334 BC, but he was forced (by old age or illness) to stop with the year 341/40 BC, having written 29 books. A 30th book was added by his son Demophilus, which still did not complete Ephorus' original purpose.

Ephorus was above all a didactic historian. In line with most contemporary historiography he wrote primarily for the purpose of instructing. The moral appraisements of public men (praising the good and censuring the bad) that we find in books 11 and 15 of Diodorus Siculus had their origin in Ephorus, who in turn applied to historical writing Isocratean theory on the subject. Rhetoric and a fine style, whether in writing or in speaking, were not ends in themselves for Isocrates, but merely tools to be employed, along with anything else that could be so utilized, for the attainment of correct, virtuous conduct, above all by political leaders. Writing at a time when Greece had succumbed to Macedon, Ephorus, naturally enough, sought to explain the collapse of the leading states of Greece and the rise of Macedon: ethical and pious conduct, whether by individuals or by states, in private no less than in public life, was Ephorus' (and Isocrates') recipe for success, one entirely in keeping with conventional Greek morality. For Ephorus, therefore, the failure of Greece was essentially a moral matter, as was also Philip's corresponding success.

Conventional in his outlook, as a historiographer Ephorus was nevertheless highly innovative and influential. He appears to have been the first writer to divide his work into books, providing each with its own preface. Within books events were narrated, in so far as it was possible, from beginning to end without interruption, and they were grouped together so as to form a thematic unity. There can be little doubt that this was a conscious attempt to improve on the annalistic presentation of Thucydides and the Oxyrhynchus historian, both of whom Ephorus employed as sources. The belief, almost universally held by scholars, that, always and as a matter of principle, each book was devoted exclusively to the history of one of the four major regions with which the *Histories* were concerned, that is, mainland Greece, the west, the east (Persia), and (after 360 BC) the north (Macedonia), can be shown from the fragments and the text of Diodorus Siculus to be wrong. Ephorus' method was not inflexible. Events from different regions were often related in close sequence in

the same books, with any connections between them highlighted.

Often uncritical in the use of his sources, prone to exaggeration (for example, he habitually inflated figures for barbarian forces, even when he knew better), and to smoothing over difficulties, Ephorus falls short of the high standards of the greatest of the Greek historians. Even so, his achievement in composing for the first time a general and systematic history of the Mediterranean world was considerable, and the *Histories* remained canonical reading for as long as the ancient world was able to handle works on such a scale. Its popularity is indicated by the extent to which it was used and imitated by other writers. Diyllus, the Athenian historian, made the year 340 BC (where Ephorus broke off) the starting-point of his own general, Greek and barbarian, history. Strabo, the eminent geographer, made extensive use of Ephorus, quoting him on numerous occasions; and of course much of the surviving work of Diodorus Siculus is in essence Ephorus, abridged and paraphrased. We would have a much poorer understanding of the 4th century but for Ephorus, as he has come down to us in Diodorus.

P.J. STYLIANOU

Biography

Born c.400 BC at Cyme in Aeolis in Asia Minor, Ephorus seems to have been a pupil of Isocrates at Athens. His principal work was the *Histories* in 30 books, a universal history from the Dorian invasion to his own day (the last book was written by his son). He also wrote a local history of Cyme, a book on style, and a book on discoveries. All his works are lost, but the *Histories* was an important source for other historians, notably Diodorus Siculus. He died in the 320s BC.

Epicurus 341–270 BC

Philosopher

Though an Athenian by citizenship, Epicurus was born and brought up in Samos, after his father Neocles emigrated to the Athenian cleruchy

there. He was educated in Athens by the Platonist Pamphilus and the Democritean Nausiphanes. After a period teaching philosophy in Mytilene and Lampsacus he returned to Athens (307/06 BC) and bought a house with a garden (on a site between the Dipylon Gate and Plato's Academy) where he set up his own philosophical school (sometimes referred to simply as "the garden"). He created scandal by including both slaves and women in the community of followers who gathered around him.

Philosophically, Epicurus was a hedonist, in that he believed that pleasure was the goal of all activity, but his conception of pleasure was a very austere one. The supreme pleasure, he claimed, could be enjoyed only in the absence of all pain (and indeed in some sense pleasure consisted of the removal of pain, as in drinking when we are thirsty, or eating when we are hungry). Since an unfulfilled desire is a pain, then the happy life can be achieved only if we restrict our desires to those that are related to natural, satiable, appetites (e.g. for food or drink), and remove those that spring from unnatural appetites (for gourmet meals, for example, or wealth, fame, and power); such desires, being unnatural, have no natural limit, and so can never be satisfied. He recommended, then, a simple life of unambitious obscurity. To the objection that uncontrolled pain in this life, and punishment by the gods in the life to come, might overbalance any pleasure we may achieve, he responded that death was our guarantee that no pain could become so great as to overcome pleasure entirely; death limits the amount of pain we can suffer, because it is the end of all sensation: "Death is nothing to us, for when we are death is not, and when death is we are not." So far as the gods are concerned, they would not be able to live lives of perfect pleasure if they bothered themselves with the running of the world, and so, he argues, like perfect Epicureans they enjoy an existence of eternally undisturbed blessedness, taking no interest in us or our activities. He supported these positions by adopting a modified form of the atomism of Democritus, which enabled him to explain the creation and existence of the world in purely mechanical terms, as the result of random collisions of atoms, without having to bring in a divine creator. Since the human soul also consisted of atoms, which dispersed at death, there could be no afterlife, and death need no longer be feared. His principal modification of Democritus' system was the introduction of an uncaused swerve that some atoms made at random times; this seems to have been Epicurus' attempt to escape the risk that Democritus' purely mechanistic universe would rule out human free will, but the fragmentary nature of the evidence makes it difficult to be certain how he thought of this as working. He went on to develop a sophisticated theory of perception (sight, for example, being caused by

thin films of atoms that are constantly being cast off by physical objects, and which are brought into contact with our soul-atoms through our eyes), and on the basis of this a theory of knowledge that rested on the absolute reliability of all sense perception (but not of our interpretation of it).

Though Epicurus was reputedly a prolific writer, very few of his works survive. Diogenes Laertius' *Lives of the Philosophers* preserves three "letters" (really short essays) on ethics, astronomy, and physics, together with a collection of 40 sayings, the *Principal Doctrines*. Another similar collection is preserved in a manuscript found in the Vatican in the 19th century. In addition, in the 18th century, scrolls of his major work, *On Nature*, were discovered preserved by volcanic ash in the Villa of the Papyri at Herculaneum; attempts to unroll and read them have been successful only recently. Otherwise we are dependent on an account in verse of his physics written by the Roman poet Lucretius, and summaries of his doctrines by writers such as Cicero and Plutarch, given from the point of view of his philosophical opponents.

Unlike many ancient philosophical schools, the Epicureans were enthusiastic proselytizers, and made an effort, with popularizing accounts of their doctrines, to make a wide appeal, and their success attracted the hostility and contempt of the followers of more conservative schools. A striking example of the degree of enthusiasm that the school could arouse in its followers is shown by a massive inscription (covering a wall about 80 m long) put up in the Lycian city of Oenoanda in the 2nd century AD by the Epicurean Diogenes for the edification of his fellow citizens, and containing among other things treatises on ethics and physics, and a collection of maxims. There is no evidence that the school survived into the 3rd century AD.

Though Epicureanism, with its emphasis on community and moderation, its enthusiasm for proselytizing, and its hostility to conventional religion and superstition, might be thought to have many points of resemblance to Christianity, Christian writers treat it on the whole unsympathetically. Although some Epicurean teachings (that the soul is a physical thing, for example, and that the world had a beginning and an end) gave welcome support to the Christian position in controversies with other philosophical schools, so that in these contexts Epicurean views could be cited with approval, Christians in general were unsympathetic to Epicureans. Their denial of a life after death, their belief that the gods did not concern themselves with what happens in the world, and their elevation of pleasure as the ultimate goal of all activity made them the representatives of all that was wrong with non-Christian thought. A very few Christian writers saw their virtues (Gregory of Nazianzus, for example, praises Epicurus for

his moderation), but in general they do no more than repeat anti-Epicurean polemic picked up from the writings of rival philosophers, and played a great part in perpetuating the caricature of Epicureans as vulgar hedonists.

RICHARD WALLACE

Biography

Born in Samos in 341 BC, Epicurus was educated in Athens where he was a pupil of the Platonist Pamphilus and the atomist Nausiphanes. In 309 he began teaching and opened schools in Mytilene and Lampsacus. In 307/06 he returned to Athens and opened a school called "the garden" which continued to teach Epicureanism until the 2nd century AD. Apart from some surviving fragments his writings are best known through the *De Rerum Natura* of Lucretius. He died at Athens in 270 BC.

Epidaurus

City in the eastern Peloponnese

Epidaurus is a typical small Greek city, hardly bigger than an English village, situated on the coast at the south side of the Saronic gulf. It is important for one reason only, the existence in its southern hinterland of the remains of the ancient sanctuary of Asclepius the healing god, the most significant of his sanctuaries in mainland Greece.

Asclepius was something of a parvenu among the Greek gods. According to his mythology, he was the son of Apollo and a mortal woman Coronis; originally a mortal, he was only subsequently deified. There is no real trace of his cult in the early Greek tradition, and his sanctuary at Epidaurus was grafted on to an existing sanctuary of Apollo. At first it was completely nondescript, an altar and a small adjacent building. Apollo himself had little more, and the whole is typical of the modest sanctuaries that were sufficient for and all that could be afforded by the less wealthy Greek communities. It is thus possible to trace its deliberate conversion, the reason and means whereby this was achieved, into one of the major sanctuaries of

Greece.

The cause seems to have been the great plague which struck Athens during the early years of the Peloponnesian War, when the rural population was evacuated into the area defended by the walls that linked Athens to Piraeus, in squalid conditions with no sanitation. At this time, the last third of the 5th century BC, Greek medicine was developing along scientific – certainly pragmatic – lines. It is the time of Hippocrates the “father” of Greek medicine. But parallel to this was a firm belief, certainly among the mass of the population, in miracle cures brought about by the intervention of a deity. Asclepius, through his father, was the appropriate focus for such beliefs, and duly acquired divine status. Since conventional doctors had no cure for the plague, anyone who recovered, or any community which escaped, could only credit this to the intervention of the god, and the reputation of Asclepius was thereby greatly increased. A small sanctuary (again, grafted on to one of Apollo) was established in 416 BC on the south slopes of the Acropolis at Athens; but it was Epidaurus (which seems to have escaped the spread of the plague) that benefited the most.

The sanctuary was supposedly at the place, or, rather, one of the places, where it was believed that Asclepius was born. During the 4th century BC the amount of patronage attracted to the sanctuary, and, by implication, the amount of revenue it raised for the cult, enabled a substantial building programme to be carried out. The contracts for the various necessary building projects were recorded by inscriptions on stone. Many of these have survived, and record the progress of the sanctuary’s development, and the means by which this was achieved. The work was under the control of an official board of commissioners, who were entrusted with, or more likely actively collected, the necessary funds. They appointed roving ambassadors who visited cities up and down the Greek world asking for financial support. They let the contracts, to quarrymen, to transporters, and to craftsmen. They appointed the architect. They also appointed guarantors, wealthy citizens of Epidaurus, who would be liable to financial penalties if the work was not carried out to the satisfaction of the commissioners. These inscriptions record the cost of materials and their transport, the wages of the craftsmen, and the salary paid to the architect (he got double the rate of an ordinary workman, which suggests that his pay was regarded basically as expenses only). It is possible to calculate, when the inscriptions are well enough preserved, the actual cost of the buildings, and these make clear that figures given in later literary sources for other building projects, particularly those on the Acropolis of Athens, are grossly exaggerated.

The first essential in the building programme was the Doric temple

of Asclepius, in limestone, brought mostly from Corinth, and with Pentelic marble for the sculptural decoration. In front of this was the altar, and to the north a long enclosed building, the Abaton, which was the place of healing: in this the patients slept, and during the night were supposedly visited and healed by the god. Next came the most ornate structure, a circular Doric building called the Thymele. It once had important painted wall decoration, described by Pausanias but now irretrievably lost. The circular cella had a decorative interior colonnade of Corinthian columns. (There were probably Corinthian columns also in the temple but these have totally vanished.) It all rested on a maze of circular foundations, each ring accessible to the next through doorways. Its purpose is enigmatic, but it is probably best interpreted as a cenotaph, representing the burial place of the human Asclepius before he was deified. The inscriptions for this building cover a period of over 30 years, in the second half of the 4th century BC, a time when, it is clear, funds were coming in erratically. Another important building of this period is the great theatre, the best preserved in mainland Greece, attributed by Pausanias, together with the Thymele, to Polyclitus, who he seems to have thought was the famous Argive sculptor. But the dates are wrong, and unless this is a total mistake, the architect was probably a descendant of the sculptor.

Construction work continued well into the 3rd century BC, buildings often being paid for by single donors. They include a large courtyard building, with an elaborate ramped entrance for processions, and surrounded by rooms equipped for ritual feasting in the Greek manner, the participants in the sacred meals reclining on simple couches. There is a propylon, or gateway building, not an effective barrier, since it can be bypassed to either side. Its function is to mark the entry into the sanctuary; there was a rule that all the sacrificial meat had to be consumed within the boundary. There was quite elaborate provision for water supplies; the abundance of water, still a feature of the site, is undoubtedly the reason the sanctuary developed at this particular spot. There is a stadium for athletic contests. There are also temples and altars to other deities, to Apollo's sister Artemis, and to other gods whose identity is not recorded.

The sanctuary flourished throughout the Hellenistic period, when many of the cures effected were recorded on inscriptions ("publication promised"). It was ransacked in the disturbed times of the 1st century BC, but revived and flourished again under the Romans, when buildings were repaired and a bath building added. The last recorded cures date to the 4th century AD, but the whole cult, its beliefs and practices, had such close parallels to Christianity (which was certainly influenced by this and similar cults) that it was regarded as a blasphemy, and ceased to function. The buildings fell into ruin, except

for the theatre the seats of which were covered by earth slips. In the late 19th century the theatre was excavated and now plays an important role in the continuity of the Hellenic tradition, as a venue for the modern production of classical Athenian drama.

Epigram

Originally an epigram (from the verb *epigrapho* – "I write upon") was an inscription on an object or a monument. Its original application determined the characteristic features of what was to become a literary genre; it was brief and in verse, while its content was usually dedicatory or funereal. The literary genre of the epigram in its non-inscriptional form was developed and cultivated intensively in the Hellenistic and imperial periods. The epigram is perhaps the sole ancient literary genre that has been practised unremittingly down to modern times. Although the genre underwent considerable changes in the Byzantine period, the basic characteristics remained the same, while its original association with inscriptions was not entirely lost.

Archaic epigrams are inscriptions. The earliest known (8th century BC) are in hexameters but very soon the predominant metre became the elegiac couplet which was to become the classic metre of the epigram. The epigrams of the Archaic period are mostly epitaphs or inscriptions on an object, and they consist largely of formulas.

Many inscriptional epigrams from the Classical period are anonymous. The first known epigrammatist was Simonides of Ceos (557/56–468 BC) who wrote funeral epigrams on the fallen in the Persian Wars. Yet only a few of the epigrams attributed to him are certainly his. Some renowned figures such as Aeschylus, Euripides, Plato, and Aristotle also composed epigrams which now became increasingly elaborate in form and content. Their aim is often to edify, but human feelings are also given expression.

The beginning of the Hellenistic age marks a turning point in the history of the epigram. Two important changes raised it into a literary genre: it became less factual as it gradually lost its association with

actual events and objects, and thus served no practical function; and it was published mainly in book form. The epigram now became a vehicle for the expression of personal feelings, assuming the role traditionally played by lyric and sympotic poetry. Allusiveness, conciseness, density of expression, wit, and a constant search for variation now became characteristics of the genre. Two schools of early epigrammatists may be distinguished: the Dorian-Peloponnesian and the Ionian-Alexandrian. In the first the leading figure was Leonidas of Tarentum, as well as the female poets Anyte, Nossis, and Moiro. They show a preference for the traditional inscriptional epigram, i.e. dedicatory and funereal. The ordinary and idyllic replace the heroic aspect, but the style is often ornate or even pompous. Callimachus, Poseidippus, and Asclepiades are eminent figures of the Ionian-Alexandrian school. Witty language and the art of allusion are skilfully used to describe the pleasures of life, wine, love, song, women, boys. In the 1st century BC the epigram blossomed with Antipater of Sidon and Meleager of Gadara (Phoenician school). The latter compiled the first anthology of epigrams known as “Garland” (*Stephanos*). It became a characteristic of the literary epigram to appear in anthologies. The most important were the *Garland* of Philip (c.AD 40), the *Cycle* of Agathias (6th century AD), and later the *Palatine Anthology* (c.980) and the *Planudean Anthology* (1301).

The epigram flourished in the imperial age and was taken over by Roman poets. There is a noticeable change not only in the themes of epigrams but also in their tone. Ecphrastic and epideictic epigrams for various occasions – epigrams on events of everyday life, to accompany gifts, to console or to congratulate, to thank or invite now predominate – and satirical epigrams also became very fashionable. Many Greek epigrammatists, such as Philodemus, Crinagoras, and Antipater of Thessalonica, frequented Roman high society. In the 2nd century AD the epigram went through a classicizing phase; and the erotic epigram was revived with Rufinus and Strato, who wrote pederastic ones.

Epirus

Region in northwest Greece

Epeiros means “mainland” in ancient Greek. At first sight this seems rather a vague term, but the western coast of Epirus is the mainland opposite the northern Ionian islands of Corfu and its outliers. The eastern border is formed by the central Pindus massif running like a spine through northern Greece. To the north, the central Albanian plain beginning near Vlorë marks the end of Epirus, basically a mountainous region, while to the south the Gulf of Arta and the comparatively low-lying areas of Aetolia and Acarnania form a similar barrier. Three parallel high limestone ridges running from north to south dominate the landscape and make the area curiously enclosed, since invaders coming from the north can climb up the valleys of the Aoos (Vijosë) river and its tributaries, but eventually these lead nowhere. The alluvial valleys are quite fertile, but flooding is always a danger. There are few natural harbours, and these are liable to silting. Rainfall by Greek standards is plentiful, although winters are harsh, and melting snows cause deforestation.

The *Odyssey* refers to Epirus as the mainland and to the possibility that Odysseus may have sheltered in Thesprotia, the area opposite Corfu which is still known by this name. Homer in the same poem talks of the oracle of Dodona, second only to Delphi in fame and to none in antiquity, situated in the mountains of eastern Epirus. Herodotus mentions Epirus as the home of the ancient Dorians and refers to the oracle at the mouth of the river Acheron in southern Epirus. The Persian and Peloponnesian Wars do not seem to have impinged much on Epirus, although the Persian invasion to the east, the conflict between Corcyra (modern Corfu) and Epidamnus to the west, and the campaigns of Demosthenes in Aetolia to the south must have made some mark.

In the 4th century BC the Greek world widened. Philip of Macedon was married to the sister of Alexander, a powerful king of the Molossians, who seems to have established hegemony over the rest of Epirus. He and his more famous cousin Pyrrhus tried to expand westwards in the same way that Alexander the Great had expanded the power of Macedon to the east, but both perished in the attempt. Nevertheless, the 3rd and 2nd centuries were prosperous times for Epirus in which powerful cities like Antigoneia and Amantia were built. Modern Albanian historians tend to see these as Illyrian foundations, but 4th-century inscriptions show the tribes of Epirus, including the Molossians, writing in Greek. The Molossian monarchy fell in 232 BC and was replaced by a federal republic with an assembly

at Phoenice (modern Finiq) in the Greek-speaking part of southern Albania. In Rome's war against Macedon, Epirus changed sides and was punished for its faithlessness by the Roman sack of many Epirote towns and the enslavement of 150,000 captives in 168 BC.

Not surprisingly, Epirus fell into decline under Roman rule. Cicero's friend Atticus had rich estates at Buthrotum (modern Butrint) and Latin settlers and traders may have brought some prosperity to the coast near Italy, although both branches of the Via Egnatia passed further north. Augustus founded Nicopolis near Preveza and Hadrian Hadrianopolis near Gjirokastër. Rome foundations in Greek lands soon lost their Latin speech, but the influence of Latin should not be discounted as a factor in west Balkan ethnology, as it would help explain both the presence of large numbers of Vlachs in Albanian and Greek Epirus and the survival of Albanian, not giving way to Greek or Latin because neither was the dominant lingua franca.

Epistolography

Epistolography (from Greek *epistole* "letter" and *graphia* "writing") is letter writing. The term is used for a literary genre in which works are written in the form of letters. Such letters are known as literary letters – as distinguished from private and official letters – if they were either primarily destined for publication by their author or if they were published posthumously for the sake of their contents and what they reveal about the personality of the author (or of the addressee). A sharp line, however, cannot be drawn between literary and private letters. Private letters published afterwards should be assigned to epistolography if they are autobiographical and contemporary documents. In this case they are called literary private letters.

In Classical times folding wooden boards were used for correspondence. They were covered inside with wax to be written on and were used for answering letters after the initial message had been erased. Papyrus was also used – demonstrated by the large number of private letters written on papyrus – and, later on, parchment and paper. Since there was no public mail service, letters were sent by messengers who had to be privately hired in each case; another possibility was to send letters with travellers.

Letter writing is not a Greek invention: in the 2nd millennium BC the Egyptians were already collecting correspondence. A theory of letter writing was gradually developed by the Greeks during the Classical period around the 5th century BC, at a time when the contents and functions of literary forms were the subject of analysis. Moreover, the art of rhetoric became increasingly important. Since epistolography was regarded as an aspect of rhetoric, basic rules and principles for writing letters were developed. Some of the thoughts and general considerations about style of one of the oldest theoreticians, Artemon of Cassandreia (1st century AD), were indirectly passed on to us through statements of a late Hellenistic author, pseudo-Demetrius (c.1st century AD). In the 2nd century AD a certain Philostratus established a system of rules that classified the most important items for a cultivated and refined style. Here readers learn that a letter should be an image of the writer's soul. Letters are considered to be identical in character to conversation, hence great value is attached to forms of salutation and direct address in the text. The style should be distinguished by brevity and clarity; the language should be elevated but understandable. All this can be achieved by a moderate use of Atticisms and by avoiding rarely used words. Rhetorical ornamentation is allowed in principle but should be used with moderation. Metaphors, for instance, should be avoided, but the insertion of narratives and myths, literary allusions, quotations, and proverbs is encouraged.

In later centuries these theoretical principles were taken up and described repeatedly, but observed less and less in practice. Practical examples accompanied theoretical considerations. Pseudo-Demetrius, for instance, gives a survey of different letter forms (he mentions 21), quoting a sample letter for each type. In the Renaissance this author was still in demand in the Latin west, as revealed by occasional references to him by the famous humanist Erasmus of Rotterdam in his guide to letter writing.

Literary letters appear in various forms, and theoreticians who have tried to classify them strongly disagree over their number. Both the didactic epistle, which is often used in philosophical discussions, and the dedicatory epistle, used as a preface to literary works addressed to

a specific person, are found, for example. Faked letters, which first became popular during the Hellenistic period and which were sometimes compiled as epistolary novels, were used for rhetorical exercises. In addition, there are private letters concerning friendship, comfort, requests, thanks, recommendation, praise, and reproach.

When writing a letter, certain conventions had to be observed. Letters usually consisted of three parts: the introduction or *praescriptum*, the actual text, and the final clause. The *praescriptum* originally contained only the salutation of the addressee, according to the scheme “A greets B”, but this could be extended to a greater demonstration of friendship in the introductory and final parts, especially if the addressee’s health became the main topic.

More or less private collections of correspondence are known for almost all famous people (though many only through references in other works), beginning with the Classical authors. In the Hellenistic period the writing of letters increased and gradually gained in importance over the following centuries. The extensive correspondence of the rhetorician Libanius (4th century AD) contains more than 1500 letters written to or by Libanius, some of them addressed to famous contemporaries. It is important to note that collections of private letters not only contain letters received by the respective addressee, but also letters written by him. When a letter was composed it was usual – especially with regard to later publication of the correspondence – to make a duplicate and retain it in a private archive. Before publication letters were sometimes subjected to a second rhetorical and stylistic revision. A letter was not only an instrument of communication, but a real literary product. A letter that was carefully drafted according to the rules of rhetoric was, naturally enough, enthusiastically received by the addressee. Many inspired passages were almost literally reproduced in subsequent letters of the recipient’s own; this was not regarded as reprehensible but, on the contrary, as desirable. It was called *mimesis*, imitation. Moreover, it was customary to read elaborate letters aloud to interested circles in order to enjoy collectively a writer’s language and expression.

Epistolography was also influenced by Christianization. The epistles of the apostle Paul to early Christian communities, for instance, had a partially didactic, partially encouraging purpose; they stand at the beginning of the tradition of the pastoral epistles and encyclics of the Christian Church. The letter was also an important instrument for the Fathers of the Church in the discussion of dogmatic, exegetical, and philosophical problems. Christian influence is evidenced by stereotyped phrases, modesty demanding that the sender – independent of his social position – assume an attitude of humility

and place himself on a lower level in relation to the addressee. The form of salutation here is: “it is B that A greets” or “B is greeted by A”.

Erasistratus c.315–c.240^{BC}

Physician

Erasistratus is known as the father of physiology. Born into a medical family in Iulis on the island of Ceos, educated in Athens in the peripatetic philosophy of Aristotle and Theophrastus, he later learned medicine on the island of Cos. Aristotle’s son-in-law Metrodorus taught him medicine. Around 293^{BC} he was a court physician to Seleucus I Nicator and worked mostly in Antioch in medical practice. By tradition, he became a member of the Museum in Alexandria. Later writers, such as Celsus, associated Erasistratus and Herophilus as colleagues in research in the Museum, but some modern scholars are sceptical that Erasistratus was actually in residence in Alexandria. More likely he conducted his anatomical research there, since it is doubtful that dissections could have been conducted elsewhere.

The leisurely research environment of the Museum and his previous philosophical and medical practice enabled Erasistratus to examine the physiology of the body in a comprehensive system. He provided original and important observations on the functions of blood, air, digestion, and nerves that were probably explained in his work *Oi Katholou Logoi* (*General Principles*). None of Erasistratus’ works is extant, but, because later authors, especially Galen, referred to him extensively, his ideas are preserved. Although Erasistratus influenced physiology, medicine, and, to some degree, philosophy, his major influence was confined to specific contributions.

Erasistratus’ system combined a mechanistic system of bodily functions influenced by his Stoic teacher, Chrysippus, and by his anatomist colleague at Alexandria, Herophilus. Also influential on his thinking were the peripatetic teleology of causation and an abiding commitment to empirical verification, perhaps derived from Strato. Dissection of human cadavers was conducted at the Museum. The Roman medical writer Celsus (early 1st century^{AD}), attributed

vivisection of condemned criminals to both Herophilus and Erasistratus. Later Christian writers (Tertullian and Augustine among them) repeated the accusation. Many modern scholars are sceptical because Galen, who employed Erasistratus' works extensively, made no mention of the practice, but he described Erasistratus' vivisection experiments with animals. However, Erasistratus himself did say that the examination of dead bodies can be deceptive in terms of what we may learn about the functions of live bodies.

Erasistratus wrote on abdominal pathology. Gargilius Martialis (fl. 3rd century AD) referred to Alexandrian deep autopsies for the cause of death. In particular he spoke of an examination of death by lice-induced typhus where death was detected by changes in cardiac tissue. Whereas Gargilius did not specifically name Erasistratus, he is the only one at Alexandria whose name is associated with autopsy.

Erasistratus' assertion that the heart was central to both the venal and the arterial systems has led some modern scholars to claim that he foresaw the circulatory system, but this is not the case. Erasistratus thought that the heart pumped blood through the venal system to all the parts of the body to convey nourishment. The liver transforms nutriment from the digestive tract. Galen would later assign a greater role to the liver because he did not accept Erasistratus' assertion that the heart completes the process started by the liver. To Galen the liver was the beginning of the venal system, not the heart. According to Erasistratus nourishment in the form of blood reaches its destination in tiny particles through very fine pores. The arterial system delivered vital spirits in air (*pneuma*), and some of the vital spirits in blood pumped by the left heart ventricle are transformed by the brain into psychic spirits (another *pneuma*) and subsequently conveyed through the nerves to all body parts. Each form of *pneuma* from veins, arteries, and nerves ultimately was delivered through such fine networks as to be invisible. Thus the organism was a combination of three mechanisms: appetites (*orexeis*), energies or forces (*dynameis*), and substances (*hylai*).

According to Erasistratus, the process which supplies nutriment in the form of blood from its production centre in the liver pumped by the heart to all parts, is analogous to the function of water in the garden. Just as in the garden, the water is consumed and so is the blood. The observation that a severed artery spurts blood is because of a vacuum created by the outflowing air. The vacuum's action (*horror vacui*) also causes the flow from the veins and nerves throughout the body. Perhaps Erasistratus' mechanical action was derived from or inspired by Strato.

Erasistratus demonstrated the metabolic process in a famous experiment with birds, the details of which are preserved in the tract

Anonymous Londinensis of the 6th century AD. A bird or similar animal would be deprived of food for some time, then it would be weighed, as well as its excrement, over a period of time. The postulate is the loss of weight of the combination of excretions and the animal is accounted for by the equivalent consumption of nourishment.

He wrote in a lost work, *On Fevers*, that fevers resulted from inflammations, a theory rejected by Celsus and Galen. He regarded as a main cause of disease an excessive flooding of the blood, because excessive nourishment ultimately compresses *pneuma* in the extremities of the arteries, thereby causing inflammations. Like Herophilus, he thought that men and women had the same diseases, none being peculiar to a single sex. Both Erasistratus and Herophilus saw the differences between sensory and motor nerves. Erasistratus rejected most therapeutic uses for bloodletting, again supplying the rejection by later medical writers who knew his works.

Although many late Greek and Roman writers cited Erasistratus' works, especially Galen, none adopted his medical system, and yet all were influenced by Erasistratus' specific contributions about the body's functions.

Biography

Born c.315 BC at Iulis on Ceos, Erasistratus was educated in Athens at the peripatetic school of Aristotle and Theophrastus and later in medicine on Cos. Then he moved to Alexandria and joined the Museum where he worked with Herophilus. None of his writing is extant but he had a great influence on subsequent work in physiology and medicine. He died c.240 BC.

Eratosthenes

Scholar of the 3rd century BC

Eratosthenes, son of Aglaos, was a renowned scholar, poet, and scientist. His family was Cyrenean and was probably not of substantial means, although it could afford to send him to Athens for his education. His birthdate cannot be established with certainty. The *Suda* places his birth during the 126th Olympiad (276/275–273/272 BC), but this is too late and scholars now put his birth in the mid-280s BC. Eratosthenes did not receive his education at nearby Alexandria, but rather went to Athens to pursue philosophy. He studied with Zeno, founder of the Stoic school, Arcesilaus, head of the Platonic Academy, and Ariston of Chios, who had established a new branch of the Stoa. His varied philosophical studies reflect the eclecticism that consistently informed his life's work.

In 245 BC, at the age of about 40 and on the strength of his growing reputation in the fields of poetry, mathematics, and geography, Eratosthenes was invited by Ptolemy III Eurgetes, king of Egypt, to come to Alexandria. After the retirement of Apollonius of Rhodes, he assumed the directorship of the Library of Alexandria, one of the most prestigious positions in the ancient world. He remained there until he was succeeded by Aristophanes of Byzantium. His death, which occurred during the reign of Ptolemy V Epiphanes, may be dated to between 205 and 195 BC.

Eratosthenes was an expert in philosophy, grammar, poetry, chronology, mathematics, astronomy, and geography, and the breadth and the versatility of his intellect were both praised and censured in antiquity. Admirers called him a “second Plato”. Others preferred to call him *pentathlos* (“jack of all trades”), since he was versed in so many branches of learning, or *beta* (“second best”), since he never specialized in any one area but showed enough brilliance to be considered the second leading authority in many disciplines. Each term was used in both derogatory and complimentary contexts. Eratosthenes himself coined the term *philologos* (“scholar” or “lover of learning”) to describe his scholarly activities.

His works are known only by title or through fragments. No comprehensive edition of the fragments exists, although fairly good editions of individual areas have been published. His three-volume work *Geography* and his *On the Measurement of the Earth* epitomize his scientific spirit. Eratosthenes broke from his predecessors in rejecting Homer and mythology as trustworthy sources of geographical information and relied instead on his training in mathematics and astronomy and on the immense resources available in the Library at Alexandria. The *Geography* was intended to describe the entire

inhabited world. In book 1 he attacked the use of Homer in geographical studies and pointed out the flaws of previous geographical works, which had now been rendered obsolete by the extensive information garnered from the military expeditions of Alexander the Great. In book 2 he fixed the world's breadth and length, and in book 3, he used his measurements to construct a map of the world. Eratosthenes' anthropology, set forth in book 2, is remarkable, in so far as he rejected the traditional categories of "Greek" and "barbarian", preferring to regard people on the basis of good and bad qualities. In *On the Measurement of the Earth* he used his mathematical skills to calculate the earth's circumference, which he fixed at 252,000 stades or 24,662 miles (accurate to about 1 per cent).

Eratosthenes is accredited with establishing the field of scientific chronology. He revised the existing Olympic victor lists (widely used for determining dates) and published his revision in two books. Using those Olympic lists and, for prehistoric events, the lists of Spartan kings, he wrote his own *Chronology*, which established a timetable from the Trojan War (which he dated to 1184/83 BC) down to the death of Alexander (323 BC). Eratosthenes divided this 860-year period into 10 epochs, with events listed in the form of chronological tables.

Eratosthenes was eclectic in his approach to philosophy. He received his training from the Platonist Arcesilaus and the Stoic Ariston; he also heard the teachings of the Cynic Bion of Borysthenes. Eratosthenes' philosophical writings, which survive only in a few fragments, probably predate his arrival at Alexandria. The *Platonicus*, penned in the traditional dialogue format, dealt with Platonic astronomy and mathematics. Other works, such as *On Freedom from Pain*, *Ariston*, and *On Good and Evil Qualities*, have been lost. Many later writers heaped scorn on Eratosthenes' philosophical treatises, but their attacks are heavily flavoured by sectarian biases.

Eratosthenes was considered one of the great mathematicians of his day; Archimedes dedicated a book to him and corresponded with him on mathematical problems. Little remains of his works, however. He developed a method for determining prime numbers, the so-called Sieve of Eratosthenes, which in modified form (needed, since the system does not work with high numbers) is still critical for number theory research; he wrote on progressions and proportions; he solved the problem of how to double a cube, for which he designed a mechanical instrument; and he discussed musical scales. He applied his learning in geometry to the fields of astronomy and mathematical geography. For example, he measured the distance to the sun as 804 million stades (= 78 million miles, versus the actual 92.9 million) and to the moon as 780,000 stadia (= 76,500 miles, versus the actual 239,000). The tilt of the earth's axis was calculated, with great

accuracy, as 23 degrees, 51 minutes, 15 seconds. A lost treatise, *On Means*, has not survived, but it did form part of the Hellenistic edited collection *Treasury of Analysis*, which contained works by such famous mathematicians as Euclid.

In the field of literary criticism, Eratosthenes' most important work was *On Ancient Comedy*, in 12 books. This work was very highly regarded in antiquity. Evidently he wrote essays on a wide variety of topics, such as textual criticism, authorship of plays, dialectology, dates of performances, historical issues, and the interpretation of individual passages. Although he published no editions of the plays, Eratosthenes did collate available manuscripts to fix textual readings.

Very little of Eratosthenes' poetry survives. Traces of Callimachean Alexandrinism are evident. For example, Eratosthenes' short epic *Erigone*, dealing with Icarius and his daughter Erigone and her dog, evokes with its style and form Callimachus' *Hecale*. His didactic poem *Hermes*, which describes the god's ascent to the heavens, recalls the didactic poems of the 3rd century BC, especially when Eratosthenes describes the eight spheres of the universe. Otherwise, Eratosthenes displayed in his poetry his usual independence of thought. For example, he rejected Homer and mythology as useful sources of poetic material – a view that was severely criticized, since the Greeks generally believed in the centrality of Homer in culture, history, and literature; he also insisted that the purpose of poetry was to entertain, not to instruct (a principle he called *psychagogia*).

Eratosthenes was vastly unappreciated in antiquity. He had few disciples, and his writings were often subjected by later writers to scathing attacks. The nickname *beta* was an ingenious but unwarranted term for someone who was truly brilliant in so many areas. He was one of those rare people for whom the sciences and the humanities are complementary. Applying his powerful intellect to fields as diverse as mathematics, chronology, literary criticism, geography, and philosophy, Eratosthenes had few equals in his or any other era.

STEVEN M. OBERHELMAN

Biography

Born perhaps in the mid-280s BC in Cyrene, Eratosthenes was educated in Athens where he was a pupil of Zeno, Arcesilaus, and Ariston. At the invitation of Ptolemy III Eurgetes he moved to Alexandria in 245 BC where he succeeded Apollonius Rhodius as director of the Library. He made distinguished contributions to philosophy, grammar, poetry, chronology, mathematics, astronomy, and geography but was too versatile to be appreciated by his contemporaries. He died c.200 BC.

Eretria

City in Euboea

Eretria is the second principal ancient city on the island of Euboea, the first being its immediate neighbour to the north, Chalcis. In 498 BC the Eretrians joined the Athenians in sending help to the east Greek Ionian cities in their rebellion against their Persian overlords; the Eretrians contributed 5 triremes and the Athenians 20, which Herodotus says were the cause of evil for both Greeks and Persians alike. Though this achieved little enough on behalf of the Ionians beyond sacking sanctuaries at Sardis, when the Persians in their turn attacked mainland Greece in 490 BC Eretria was one of their first targets. After forcing the surrender of the southernmost Euboean city, Carystus, the Persians disembarked at Eretria without opposition and put the walled

city under siege. The city was betrayed to them after six days' resistance; they burnt and plundered the sanctuaries, in revenge for the burning of the sanctuaries at Sardis, and deported at least part of the population (they were settled by Darius near Susa, and they or their descendants were still there in Herodotus' time continuing to speak Greek, as he notes with some surprise). Doubtless more were left at Eretria following the surprise defeat of the Persians at Marathon, since there was no interruption in the continuity of the city.

The geographer Strabo, writing in the 1st century BC, mentions, in addition to the existing city of Eretria, the ruins of "Old Eretria", which he believed was the city destroyed by the Persians; the remains of houses were still visible there. Excavations at Eretria itself have demonstrated that this was not correct, that the walled city captured and plundered by the Persians was the same one that existed in Strabo's time, and which, indeed, had been the location of the city since much earlier, at least as early as the 8th century BC. What Strabo saw as "Old Eretria" was elsewhere. The most likely candidate is situated to the north of the Classical city, closer to Chalcis, on a promontory site known by its modern Greek name of Lefkandi. Here an earlier settlement and, adjacent, an extensive cemetery have been excavated going back to the turn of the 2nd and 1st millennia BC, including one extremely rich grave in a large apsidal structure surrounded by wooden posts. This site seems to have been abandoned gradually, at the same time that the site of Classical Eretria developed. Whether or not there is a direct connection, the movement of inhabitants from the one to the other, Lefkandi must be significant to the early history of the Eretrians.

In general, this area, including Chalcis, had benefited from its geographical position, facing on to the sheltered waters between Euboea and the mainland and the sea route to the southeast, past the islands of Andros and Tenos (which are a continuation of the Euboean land-mass) into the central Aegean and beyond, encouraging direct trade links through to the eastern Mediterranean (while Chalcis, situated at the narrows of the Euripus, also controlled the sea routes to the north). The link with the central Aegean had been important even in the Early Bronze Age, while the evidence from Lefkandi proves the existence of overseas contacts even at the beginning of the Iron Age when mainland Greece apparently survived in isolation. After this, Eretrian involvement in the Greek trading post at al-Mina in Syria and the distribution, to both east and west, of the Euboean pottery drinking cups decorated with suspended groups of semicircles (the "pendant-semicircle *skyphoi* ") demonstrate the importance of overseas links. Both Chalcis and Eretria, possibly in conjunction, played a major role in the early colonization movement, such as the

colony on the island of Ischia in the bay of Naples. Eretria is also credited with the earliest colonization of Corfu, though this was soon supplanted by a Corinthian foundation.

What the later Greeks remembered of this period was a war between Eretria and Chalcis, over possession of the Lelantine plain which was situated between them. Herodotus points out that the reason the Eretrians helped the Ionians in 498 BC was not support for the Athenians but because Miletus had earlier helped them in their war against Chalcis. Thucydides also mentions grand alliances, with the “rest of Greece” divided into supporters of one or other of the Euboean cities. Whether these alliances are a historical reality, or a projection back into the unrecorded early period of later political links, cannot be resolved. It may well be that defeat at the hands of Chalcis forced the Eretrians to abandon the site at Lefkandi and move to the Classical site of their city.

The early significance of Eretria is demonstrated by the archaeological discoveries there. The principal sanctuary in the city, that of Apollo Daphnephoros, boasted a major limestone Doric temple of the late 6th century BC with high-quality sculptural decoration in marble, fragments of which survive. It was sacked by the Persians. Its earliest antecedent was a small apsidal structure of the 8th century BC, one of the oldest temple buildings to be found in Greece. Other shrines included a heroon of the 7th century BC, and a Thesmophorion, also sacked by the Persians, where the finds include a deposit of drinking vessels, presumably used in the cult rather than left as offerings. Links with Athens were close: the arrangement of the late Archaic temple of Apollo Daphnephoros seems to anticipate the hexastyle Athenian temples such as that of Hephaestus (the “Theseum”) and of Poseidon at Sunium, where the original construction is dated before the Persian Wars. At the time Eretria joined Athens to help the Ionians, the Athenians had just fought a successful war against Chalcis, seized a substantial part of Chalcidian territory, and placed Athenian settlers on it, a move that must have benefited Eretria – Herodotus, perhaps, is being a shade too knowledgeable when in effect he denies this as a reason for Eretria’s support of Miletus in the Ionian revolt.

The city recovered from the Persian attack, and became part of the Athenian alliance, along with Chalcis and the other Euboean cities. Their importance was such that their rebellion in 446 BC forced the Athenians to make a quick deal with the Spartans so that they could suppress it. We have an inscription that details the harsh terms then inflicted on Chalcis, with enough evidence to show that similar conditions were meted out to Eretria. Part of Eretrian territory may have been occupied by Athenians; certainly, there was an Athenian stronghold there (but outside the city) in 411 BC, and the discovery at

Eretria of large numbers of Athenian “white-ground” vases (*lekythoi*), of the sort favoured as burial offerings in Athens in the latter part of the 5th century BC, suggests the presence of an Athenian population. Eretria finally broke away from Athens in 411 BC, after the Syracusan disaster, but in the succeeding century joined the second Athenian alliance. Philip of Macedon took the city into his sphere of interest – a Macedonian presence is subsequently attested by two vaulted Macedonian chamber tombs, one at Eretria itself and another by the road to Amarynthus to the south. During the Hellenistic period the strategic importance of this area was emphasized by the continued presence of a Macedonian garrison at Chalcis, one of the three vital strongholds, the so-called fetters of Greece. Eretria, under the shadow of this presence, seems to have had its own Macedonian garrison, at least at the time of the final war between the Romans and the Macedonian king, Philip V. During this, in 198 BC, the city was attacked and sacked by the Romans. After this, despite a short involvement in the subsequent war with Antiochus III, Eretria regained its freedom, and enjoyed a subsequent uneventful history as a small town of the Roman empire.

There are interesting architectural remains. The city walls, originally constructed in the 7th century BC (the date of the first west gate), have been partly uncovered. Sections of the early (pre-Persian) walls survive on the acropolis, while the existing traces of the walls of the lower town are probably late 4th century BC, with later repairs and additions. There are early Hellenistic houses, some of which have good-quality pebble mosaics. Most interesting of all is the theatre. Unlike most Greek theatres it was constructed on level ground, by hollowing out the orchestra and banking earth up against a surrounding support wall for the cavea. There is also an underground passage, of uncertain purpose, running from the stage area to the centre of the orchestra.

Estates

Much of the history of the Greek countryside has been characterized by the struggle between state, wealthy landowner, and peasant for control of the productive agricultural land. Given the very varied nature of the Greek landscape, it was often advantageous to produce a particular cash crop on a large scale and export it to less suitable areas. This mode of production tended to favour the wealthy landowner who controlled large estates.

The first evidence for estate agriculture, as opposed to communal or individual subsistence production, comes from the Bronze Age. During the 17th and 16th centuries BC a series of large rural structures in eastern Crete, generally termed “villas”, shows evidence for mass storage, high-status residence, and administration. These were presumably involved in the production of the wine, olive oil, and wheat mentioned in the Linear A texts. In the Linear B tablets from the Mycenaean palace of Pylos, dating to about 1200 BC, many individuals are listed as owning estates. The king’s estate, which may have been one of several royal estates, was 1800 times as large as the smallest one on the list, and three times as large as those of his most senior subordinates.

The Archaic and Classical periods were characterized by widespread small landholding, often by tenant farmers who were very vulnerable to their landlords and creditors. Archaeological survey shows a wide distribution of small structures and intensive cultivation during this time. In the course of the Hellenistic period this gradually changed, with small farmsteads being abandoned and larger landowners, often based in the cities, gradually controlling more of the land. By the early Roman period much of the Greek countryside was dominated by large estates. Few of these were actually owned by Romans; in general there is little evidence for imperial estates, colonies of veterans, or estates owned by Roman aristocrats. The pattern was more one of large estates owned by rich local families who favoured and were favoured by Roman rule. Often they were based on villas sumptuously decorated with mosaics and equipped with bath houses. This was just one aspect of the increasing social stratification and economic polarization that characterized the period.

Ethics

Although ethical precepts of a rudimentary nature are found scattered throughout early Greek poetry and the surviving fragments of the Presocratic philosophers, there was no real attempt to formulate a coherent ethical system before the time of Socrates, Plato, and Aristotle. The Delphic maxims and the sayings attributed to the Seven Sages, epigrammatic lines from Hesiod and the gnomic poets, and early philosophical fragments, such as those of Xenophon and Heraclitus, provide early examples of attempts to collect and codify ethical wisdom gathered through the experience of many generations. Even the Homeric epics, with their professedly recreational objectives, came to be treated as storehouses of advice on human conduct.

Pythagoras (c.580–c.500 BC) founded a brotherhood which (probably under Orphic influence) appears to have advocated vegetarianism associated with the belief in transmigration of the soul. The brotherhood's rules emphasized simplicity in speech, dress, and food; for Pythagoras believed that the intellectual nature is higher than the sensual, and that the best life is one devoted to mental discipline.

A note of scepticism was sounded in the 5th century BC when the Sophists questioned moral absolutes. Their common theme was that the traditional opposition of good and bad, or just and unjust does not reflect any objective fact of nature but is rather a matter of social convention. Protagoras of Abdera taught that "man is the measure of all things: of the things that are that they are, of the things that are not that they are not", meaning that human judgement is subjective, and that one's perception is valid only for one's self. The particular content of moral rules may differ, but rules of some kind are necessary, he argued, if life is to be tolerable.

But even this attempt to set up a new standard for interpreting moral actions fell before the onslaught of that very scepticism which Protagoras himself initiated. The laws and codes of society were shown to be themselves a perversion of the natural state of man. Society was depicted, as by Glaucon and Adeimantus in Plato's *Republic*, as the product of a social contract in which *physis* (i.e. natural law that "might is right") was prevented by *nomos* (i.e. established laws of society and the state) – an artificial code made by the weaker many to suppress the stronger few. Tyrants and suchlike were those who broke through these codes and asserted the primeval right of might. True justice was the interest of the stronger. It was better to do evil than suffer evil, and having done evil, it was better

not to pay the penalty than to pay the penalty. The possible consequences of such a doctrine, if translated into action, can well be imagined if one reads its representation by Thrasymachus and Callicles in the *Republic* and *Gorgias* of Plato.

Despite his ruthless criticism of the Sophists, Plato was well aware that it was by countenancing their destructive criticisms that Socrates (470–399 BC) was able to establish ethical values on the sound basis of knowledge. Socrates' contribution to ethics is best described as a way of inquiry rather than a way of life. He would ask for a definition of a virtue such as justice, courage, piety, or temperance and then, through questioning, he would demonstrate the inadequacy of the definition as a complete account of the virtue in question, and suggest the need to reformulate the definition. This method of inquiry was bound to undermine the security of conventional beliefs, and Socrates was therefore tried on a charge of corrupting the youth of Athens and was put to death. He did not subscribe to the moral relativism of the Sophists, but maintained that virtue could be known and that the good person knew what constituted virtue or justice. However, he himself did not claim to have such knowledge. Nor did he distinguish sharply between the good and the advantageous, but maintained that those who knew what good was would in fact be good. If anyone did what was not good, it was because he was ignorant of the nature of goodness. Thus, a person can become good through education.

Socrates' life and teaching gave rise to many later schools of moral philosophy. Four such schools originated among his immediate disciples: the Cynics, the Cyrenaics, the Megarians, and the Platonists. The Cynics held that self-control was the essence of virtue and that it could be taught. This was, in particular, the view of Antisthenes. The Cyrenaics were hedonists: for them pleasure was the highest good, provided it did not dominate one's life. Pleasures could not be ranked by superiority; they could only be measured by intensity and duration. The best-known member of the school was Aristippus of Cyrene. The Megarians (founded by Euclid of Megara) maintained the unity of goodness despite its equation with wisdom, god, or reason. It is the final secret of the universe, and can be revealed only through logical inquiry.

For Plato (428/27–348/47 BC), goodness is an essential element of reality. It is the common element by which all good things are good, in other words, the pure form of goodness. Not only good things, but all other forms too (being themselves good) depend on the form of the good for their sustenance and manifestation, just as all things in our world depend on the sun. Evil has no independent existence; it is an imperfect reflection of the good reality. The virtue of anything depended on its function, and human virtue lies in the fitness of a

person to perform that person's proper function in the world.

Plato believed in a tripartite soul (and its "bigger" version, the state) consisting of the rational, the emotional, and the appetitive, each with its corresponding virtue: wisdom, courage, and temperance. Justice, the fourth virtue, consisted in the harmony between these three elements, when each part of the soul kept to its appropriate place and function: intelligence must rule, emotion must obey, and the two together must control the appetite. While the unjust man lives in a state of internal strife, the just man, whose soul is thus harmoniously ordered, finds true satisfaction in the pursuit of knowledge. Plato doubtless saw in the life and death of Socrates the concrete embodiment of his ideal of the just man.

With Plato, just as with Socrates, the basic problem of ethics becomes a problem of knowledge. He who knows that moral virtue leads to happiness will naturally practise virtue. This is different from the view of many Christian thinkers who feel that the fundamental problem of ethics is one of will, since a person may know what is morally right, but may not have the willpower to carry it out.

Plato maintained that it is worse to do evil than to suffer it, because immoral conduct is symptomatic of a sick soul. Once a person has committed an unjust deed, Plato believed that it is better for him to be punished than to go unpunished, because punishment serves to cure the soul of its most serious ills.

For Aristotle (384–322 BC), the aim of life was happiness, which he defined as activity that accords with the specific nature of humanity. Although such activity is accompanied by pleasure, such pleasure is not its principal aim. Happiness results from the activity of reason (an attribute unique to mankind) functioning in harmony with human faculties.

While accepting the four-fold virtues of the Platonic system, Aristotle maintained the importance of other traits such as friendship, liberality, gentleness, truthfulness, and wit. But the most important was prudence (*phronesis*), i.e. the ability to discern the right course of action that leads to a good life. For him, virtues are essentially good habits acquired by constant practice, and he makes a distinction between moral and intellectual virtues. In connection with moral virtues, he introduces the famous doctrine of the mean. A moral virtue is a mean between two extreme vices, one of excess and one of deficiency. Thus liberality is a mean between avarice and profligacy, and courage is a mean between cowardliness and fool-hardiness. Intellectual virtues such as knowledge lead to contemplation, which is the highest human activity. Both these kinds of virtue are only a means towards the attainment of happiness, which results from the full realization of human potential.

Aristotle makes a distinction between instrumental goods (which are good only because they lead to some other thing that is good) and intrinsic goods (which are good in themselves). He also distinguishes between distributive justice and remedial justice, as well as between theoretical wisdom and practical wisdom. Practical wisdom, the knowledge which leads people to right action and a happy life, is the subject of both politics and ethics.

Like Aristotle's other works, his *Nicomachean Ethics* prompted commentaries, glosses, and paraphrases from scholars of late antiquity and the Byzantine age. Two sets of scholia are known, the first and more ancient being anonymous, and the second by Aspasios. Partial commentaries by Michael of Ephesus, Eustratios of Nicaea, and an anonymous Byzantine scholar are preserved in a Latin translation by Robert Grosseteste, Bishop of Lincoln (1253). A paraphrase was copied for the emperor John VI Kantakouzenos. This exegetical material gave rise to summaries of ethics such as those by John of Damascus, Michael Psellos, and Joseph Rhakendytes.

The chief Stoic philosophers in Greece were Zeno of Citium, Cleanthes, and Chrysippus of Soli, while the development of Stoicism under the Roman empire is represented by Epictetus and the emperor Marcus Aurelius. There were also a number of popular moralizing anthologies, and a treatise *De Virtutibus et Vitiis* is attributed to Andronicus of Rhodes. Stoic impact on Byzantine writers is evident in works such as Plethon's treatise *On Virtues*. According to Zeno, the true end of man is an active life in conformity with nature, in other words, a life according to virtue, which is the will of God and hence the law of the universe. Happiness is produced by right conduct. Originating from the views of Socrates and Plato, Stoicism taught that nature was rational and orderly, and that the only good life was one led in harmony with nature. Since life is influenced by material circumstances, one should free oneself from them as much as possible. This freedom could be achieved by cultivating certain cardinal virtues such as practical wisdom, fortitude, discretion, and justice.

Whereas Plato believed that human passions and physical desires must be regularized by reason, the Stoics rejected passion altogether as a basis for deciding what is good or evil. Although one cannot completely eliminate physical desires, a wise person can appreciate the difference between wanting something (which is caused by our desires) and judging it to be good (which is caused by our reason). The wise man identifies himself with reason, not with desires, and will neither expect the fulfilment of physical desires nor be anxious about failing to attain them. Living in a state of wisdom and virtue is the only real good, and the efforts to attain it are not hampered by external circumstances as is the search for material wealth and bodily

pleasure, since wisdom and virtue are intellectual matters and therefore are within our control.

The Stoics believed that all human beings have the capacity for reason, and therefore held a notion of equality much broader than the Greek sense of equal citizenship: common reason makes all individuals fellow citizens, observed Marcus Aurelius. From this followed the Stoic concept of a universal moral law appealing to all people. This universality of reason provided a basis for rejecting ethical relativism as taught by the Sophists. The pursuit of wisdom and virtue is open to all human beings irrespective of the external circumstances of their lives, and it is not surprising to find that the two principal exponents of Stoicism in the 2nd century AD were a slave and an emperor. Stoicism also exerted considerable influence on Byzantine monastic circles.

Plotinus (born c. AD 215), the founder of Neoplatonism, enjoined purification by self-discipline, with the object of ascending to the spiritual world and pursuing the divine out of love and enthusiasm. Some idea of the ethical theory of the Neoplatonists may be gained from its formulation in the *Sentences* of Porphyry. According to Proclus and Ammonius, evil is not a substance, but a privation of good; in particular, it was a moral turning away from God. This theory of evil and its reconciliation with free will and divine providence were adopted by Psellos and Isaac Komnenos. The Neoplatonists identified happiness as union with God. This was to be achieved in contemplation through purifying the soul of its corporeal existence by virtue. Through the Cappadocian fathers, this identification provided a fundamental structure to Byzantine moral theology. Psellos believed that Aristotelian ethics could be integrated into this structure in that “political virtue”, which is the lowest type, concerns the rationally ordered and harmonious life of man as a union of soul and body, a life formulated by Aristotle and including practical wisdom and political action. To this, Porphyry had added purificatory and contemplative virtue, and Psellos saw in them the path that leads man as immortal soul to transcend the world and reach greater union with God. A similar integration of Stoic ethics (which prescribes the ideal life of man as he is) with the Platonic (concerned with life beyond this world) was proposed by Barlaam of Calabria in his *Ethics According to the Stoics*.

Epicurus (341–270 BC) taught that the only ultimate good was pleasure (being the only good known to the senses) and that the only ultimate evil was pain. The best pleasure, that which is accompanied by no painful want, is a perfect harmony of body and mind to be sought in plain living and in virtue. Intellectual pleasures were the more refined, and were higher than the coarser physical ones purely

in terms of their quantity and durability. Tranquillity (*ataraxia*) is the highest pleasure obtainable, and comes from the removal of all emotional disturbances resulting from unsatisfied wants, through the elimination of all but the simplest needs which are then easily satisfied even by those who are not wealthy. What the Epicureans advocated, therefore, was a temperate, even ascetic, existence devoted to contemplative pursuits. If something increased pleasure and reduced pain, it was good as a means; otherwise it was not good at all. Justice was good only as a way of preventing mutual harm; but injustice brought pain and anxiety only through the perpetual fear of being discovered. The Epicureans placed high value on friendship and were famous for the warmth of their personal relationships; but friendship was good only because it tended to increase pleasure. It was believed that immediate pleasures should be postponed in order to attain more secure and durable satisfaction in the future. Therefore, the good life must be regulated by self-discipline. Religious beliefs and practices were considered harmful because they preoccupied men with disturbing thoughts of death and the uncertainty of life after death.

Etruscans

The Etruscans, a culturally unified people who settled in central Italy (between the Arno and the Tiber rivers) from around the beginning of the 1st millennium until the 1st century BC, were referred to by the ancient Greeks as the *Tyrrhenoi* (Tyrrhenians), a name that they also gave to the sea off Tuscany, still known today as the Tyrrhenian Sea. Undoubtedly, this name was given to the Etruscans because many Greeks believed that they had emigrated to Italy from the east, specifically from Lydia in Asia Minor, and were led away from a devastating famine by the son of the Lydian king, who was called Tyrrhenus (Tyrsenos). This story is preserved by the Greek historian Herodotus (1. 94. 2), writing in the 5th century BC, and is typical of traditional Greek explanations of the origins of people or city states, i.e. they began as the result of a migration under the leadership of a

mythical founding hero. Other Greek historians (e.g. Hellanicus and Anticleides) had similar beliefs about the eastern origins of the Etruscans and connected them with the Pelasgians, an ancient wandering people who eventually settled on the coast of Italy. The one ancient exception to this view is the Greek historian and rhetorician Dionysius of Halicarnassus (1. 25–30), writing towards the end of the 1st century BC, who argued that the Etruscans were autochthonous. This, according to Dionysius, was the Etruscan view of the matter. Indeed the Etruscans did not call themselves the Tyrrhenians at all, but referred to themselves as Rasenna or Rasna. This is also the view of most modern scholars who, as the result of decades of archaeological study, now believe that the Bronze Age inhabitants of central Italy (from c.3000 to 1000 BC) should be considered the ancestors of the Iron Age inhabitants, i.e. the Etruscans.

Unfortunately, because Etruscan civilization was relatively short-lived and because their once extensive literature was either obliterated by the Roman conquest or else simply failed to survive the process of transmission during the Middle Ages, very little is known about the internal events of Etruscan history. The archaeological record and the incidental references to the Etruscans by contemporary Greek and Roman writers are not complete or always reliable sources of information about Etruscan culture. However, these sources do yield considerable information about the trade relations between Greeks and Etruscans. For example, the early Euboean colonies at Pithecusae and Cumae were deliberately well situated for trade with Etruria and, by the end of the 8th century BC, Etruscan culture was largely transformed and Hellenized by Greek and other eastern objects and techniques that were introduced by the colonists. In the 7th century BC many Corinthian and east Greek vases made their way to Etruria, and by the 6th century BC the market was dominated by fine Athenian wares. There is also evidence that in the 6th century BC many Greek potters worked with Etruscan taste in mind. For example, the class of pottery known as “Tyrrhenian amphorae” features especially colourful narratives with nonsensical inscriptions that were unlikely to be recognized as such by the Etruscan buyers. Other ingenious potters, such as Nicosthenes, began supplying the brisk Etruscan market with types of vases familiar to the Etruscans from their own native *bucchero* pottery (e.g. the so-called Nicosthenic amphorae and *kyathoi* or wine ladles), but decorated in the popular Greek black-figured style.

In exchange for Greek pottery and other imported objects (Near Eastern seals, bronzes, etc.) it seems that the Etruscans mainly traded raw materials (metals). During the 8th and early 7th centuries BC, however, some Etruscan objects do begin to appear in the votive

deposits at several international Greek sanctuaries (e.g. Delphi, Olympia, Dodona, and Samos). These objects are not trade goods but typical Italic votive offerings such as bronze helmets, shields, horse bits, and other ornaments. In fact, according to Pausanias (5. 12. 5), it was the Etruscan king Arimnestos who made the very first dedication (a throne) at Olympia. During the 6th century ^{BC} Etruscan merchants seem to have circulated more widely, since their native *bucchero* pottery has been found at nearly every major site in Greece except for the international sanctuaries of Delphi, Olympia, Isthmia, and Nemea, which instead attracted finer Etruscan donations, such as bronzes, art objects, and war trophies. Most of the *bucchero* vases found in Greece are tall stemmed cups with two vertical handles – a shape that inspired the development of the *kantharos* (large-handled cup) in Boeotia and Athens. The Athenian Agora has produced a few examples of Etruscan *bucchero*, although the bulk of Attic trade with the Etruscans occurred later than the production of this type of pottery. So, in the later 6th and 5th centuries ^{BC}, the Etruscans probably traded other goods such as bronze utensils, candelabra, tripods, and spouted pitchers (known today as *Schnabelkannen*) which were widely admired by the Greeks.

The influence of Greek imports on Etruscan art is easily recognized as well. Native artists copied the Euboean Geometric and early Orientalizing styles as well as all the Corinthian styles down to the middle of the 6th century ^{BC}. Greek shapes were introduced into *bucchero* pottery. Athenian black- and red-figured pottery was also imitated by local artists, and Greek subjects and styles were introduced into Etruscan tomb painting. Greek influence is additionally apparent in Etruscan metal-working (particularly in the production of certain fibulae) and in the Etruscan art of architectural terracottas which was developed as the result of trade relations with the Peloponnese.

There is also evidence of Greeks who actually lived and worked in Etruria. For example, according to Pliny (*Naturalis Historia*, 35. 152), Livy (1. 34), and Dionysius of Halicarnassus (3. 46), one Demaratus of Corinth emigrated to Tarquinia (with three Greek artisans) in the middle of the 7th century ^{BC}, carried on a prosperous business, married a local noblewoman, and sired the fifth king of Rome (Tarquinius Priscus). Tarquinia was also home to a significant school of Etrusco-Corinthian vase painting that has been linked to Corinthian immigration. In addition, the port city of Tarquinia, Gravisca, had a wealthy Greek quarter that included a sanctuary with Greek-style temples where a syncretism of Greek and Etruscan cults took place. The Etruscan city of Caere also seems to have been partly settled by Greeks, who called it Agylla and dedicated a treasury at Delphi. At

Caere an itinerant Greek artist named Aristonothos produced an interesting and unusual hybrid *krater* (mixing bowl) depicting a naval battle and the blinding of the Cyclops Polyphemus by Odysseus and his men (Paris, Louvre).

Etruscan culture was influenced by the Greek imports and immigrants in other ways as well. For example, the Greeks brought to Etruria the alphabet and the art of olive cultivation. Greek-style hunts and athletics are depicted in many Etruscan tombs, although it seems unlikely that the Etruscans accepted the social ideals that went along with these sports in Greek culture. Etruscan weapons and warfare, including the use of warships as well as the organization of the cavalry and infantry (phalanx formation), also seem to have been influenced by Greek practice. In addition, Etruscan dress was closely related to Greek models, although the Greeks were known to have admired the native Etruscan sandals with their hinged wooden soles. The Etruscan elite also adopted the practice of banqueting on couches with drinking equipment of the type used at the Greek symposium. But unlike the Greeks, the Etruscans reclined together with their wives – a practice that the Greeks thought was barbarous.

Despite this apparent cultural dependence, Greek–Etruscan relations seem to have worsened after the large Etruscan fleet was defeated at Cumae in 524 BC by the Greeks and the Latin alliance. At this time, the Greeks controlled the overland routes into Campania and soon after they gained control of the seas as well. By the end of the 4th century BC, trade with Greece had declined considerably and very few dedications were made by Greeks in the sanctuary at Gravisca. Some Greek trade with Etruria continued in the 3rd century BC with areas as remote as southern Russia receiving a few Etruscan objects. In this small way, before they were conquered by the Romans, the Etruscans contributed to the *koine* (shared culture) of Hellenistic civilization.

Euboea

Island in the Aegean

Euboea is the second largest Greek island after Crete and runs for about 180 km along the eastern coast of mainland Greece. It is separated from the mainland by a strait, known as the Euripus, that narrows at the mid-point along the west coast. Euboea is separated into three geographical areas, each region defined by a major peak. The well-watered and forested north is dominated by Mount Pyxaria (1341 m). The central, most fertile, region is south of Mount Dirfis (1745 m), the highest point on the island, and boasts forests of chestnuts and pines on the north side. Surrounding plains produce grains, vines, figs, and olives. The southern region of the island sits below Mount Ochi (1394 m). The island has substantial mineral wealth as well, including quantities of lignite and magnesite (now being exported), marble and asbestos. The marble (cipollino) of Carystus was widely popular in antiquity, particularly in Rome during the imperial era.

From the 5th century ^{BC} bridges across the Euripus have joined Euboea to Boeotia allowing access to the western portion of the island from the mainland. With the exception of the reasonably good port located at Kymi along the rocky east coast, Euboea was most accessible by sea at Chalcis and Eretria, also on the west coast and on the southern tip at Carystus. Important modern ports are still located at Chalcis and Carystus.

Throughout the history of Euboea, environmental and geographic divisions of the island were paralleled by sociopolitical divisions. According to tradition, Euboea was originally settled by people from Thessaly – the Ellopians in the north, the Abantes in the centre and west, and the Dryopes in the south. Each region included, and still includes, a major town. Histiaea-Oreos, the modern village of Orei in the north, is located on the coast. The town was important from the Bronze Age until Classical times when it became known as either Histiaea or Oreos (perhaps an old deme name). Histiaea-Oreos controlled a fairly large and fertile plain and was described by Homer as "rich in vines" (*Iliad*, 2. 537).

Chalcis, in the centre, is located at the narrowest part of the island, facing Boeotia. The town was a trade centre for pottery and metalwork and was important during the Dark Ages. Chalcis flourished despite losing its independence, first to the Athenians, then to the Macedonians, and then to the Romans. Carystus, in the south, is located on the coast below Mount Ochi. On top of Mount Ochi is an example of the famous “dragon houses” of Euboea – ancient structures whose use is unknown. Carystus’ importance stems from its control of the southern entrance to the Euripus and of maritime traffic through the Andros straits as well as from its cipollino marble and asbestos. (Still visible in the ancient quarries are abandoned, but worked, columns from the Roman period.) Carystus suffered destruction at the hands of the Persians when its inhabitants were the first to try to oppose the invaders in 490 BC; it later came under Athenian control and may have had an Athenian cleruchy settled there. Near Carystus is Geristos, the site of a sanctuary of Apollo (first mentioned by Homer) and the one safe harbour on the southeast coast of Euboea. It was the first good stopping point for merchant ships travelling from the east and it is possible that this was the main port for Carystus in Classical times.

According to tradition, the original Euboeans were later joined by Ionians from Attica, Aeolians from Phthiotis, and Dorians from the Peloponnese. Because the textual record for the settlement and activities of early Euboea is limited, the site of Lefkandi and its rich material remains play an important role in recreating a picture of Late Bronze-Age and Dark-Age Euboea. At Lefkandi, located between Chalcis and Eretria (explored in 1965–66, 1969–70, and again in the 1980s by the British School at Athens), was found extensive early evidence for occupation from the Early to the Late Helladic and the Geometric periods, and in particular the site sheds light on the transition from the Mycenaean period to the early Dark Age. Of particular historical importance for an understanding of post-Mycenaean economic, social, and architectural developments in Greece is a cemetery found on Toumba hill (about 200 m north of Lefkandi village). At this site is the largest building known from Dark-Age Greece (c.1000 BC). It was an apsidal building, about 10 m wide and 45 m long, built of mud brick on top of a stone foundation. There was a double grave in the main room, one grave containing the richly adorned remains of a cremated male warrior and an inhumed woman. The other grave held four inhumed horses. The material remains show clear contact with other areas in the Mediterranean (such as Crete and Attica) and, more surprisingly, the existence of this structure testifies to a much more active economic role for Euboea than had been previously suspected for this early period.

During the 8th century the inhabitants of Chalcis and Eretria were among the first Greeks to found colonies and trading posts on the coasts of Sicily, Italy, Thrace, the islands of the Aegean, and possibly Syria. In fact, at Eretria, mentioned in the Homeric catalogue of ships and located about 18 km south of Chalcis, the earliest physical evidence dates to the Geometric period, when Eretrians established colonies abroad. Currently it is believed that in the late 8th century competition for land and power between these two cities led to the Lelantine War, named after the rich Lelantine plain. The victor in this war is unknown, but the war is reputed to have involved numerous Greek states. Herodotus says that Miletus supported Eretria and Samos supported Chalcis and Thucydides implies that other states were involved, but further details remain stubbornly elusive.

Euboea played an important role in many of the major historical events of the Archaic and Classical periods. For example, Hippias, the former tyrant of Athens, fled there after his expulsion from power. Indeed, after his arrival in Euboea, the Chalcidians allied with Boeotia against Athens, partly in an attempt to restore him. As a result, in 506 BC, the Athenians attacked and defeated the Chalcidians, then took their land for the settlement of 5000 cleruchs. Similarly, the inhabitants of Eretria angered the Persians because of their support of the Ionian revolt, so that in 490 BC the Persians attacked and burned Eretria, and then enslaved the citizens. Off the cape of Artemisium, a promontory on the northwest coast of Euboea, the Greeks and Persians fought one of their first important sea battles in 480 BC. (The statue of Zeus or Poseidon hurling a thunderbolt was also found there and is now located in the National Museum at Athens.)

Euboea joined the Greek forces to defeat the Persians and became a member of the Delian League until 411 BC. However, the Euboeans came to resent Athenian rule and revolted from the league in 446 and in 411 BC. The first revolt was put down by Pericles, who expelled the inhabitants of Histiaea-Oreos and settled at least 1000 cleruchs there (though after the Peloponnesian War the Spartans drove the cleruchs out and recalled the refugees). The second revolt, probably led by Eretria, was more successful, since the Athenians had been weakened by internal troubles and war with Sparta. Also in 411 the Chalcidians and Boeotians built a bridge over the Euripus, partly to interfere with Athenian maritime trade. Yet, between 378 and 376, due to dramatic changes in the balance of power in Greece, the Athenians induced most Euboean cities voluntarily to join a new maritime league. Thereafter, the populace of Euboea vacillated in their support between the Athenians and the Macedonians.

The Euboean alliance with Athens was not long lived. After the Battle of Leuctra in 371 BC, control of Euboea passed to the Thebans. In

358 the Euboeans were liberated by Chares, who restored the alliance with Athens. In 341 a Euboean confederacy was established, though after the Battle of Chaeronea (338) the island was incorporated under Macedonian control (Philip of Macedon recognized the strategic importance of Euboea and, indeed, claimed that the “master of Euboea is the master of Greece”). Chalcis sheltered at least one important refugee in this period – Aristotle died in Chalcis in 321, at the age of 62, after fleeing there because of persecution by an anti-Macedonian faction in Athens.

Roman interference in Euboean affairs began in earnest during the 2nd century BC. The Romans captured Histiaea in 199 and then in 198 captured and ransacked the city of Eretria, and in 87 BC Eretria was utterly destroyed and deserted. In 194 Euboea, as a whole, was taken from Macedon by the Roman general Flamininus, who briefly restored the Euboean confederacy. In 146 BC Chalcis was nearly destroyed for fighting with Macedon against Rome. The island was next attached to the province of Macedonia, until 27 BC when Greece became the province of Achaea. Though Euboea’s political fortunes declined after incorporation into the province of Achaea, the island was still economically viable. Greek lands, including land in Euboea, became an important source of economic power and prestige for Roman elites and archaeological investigations reveal villas and other signs of wealth. Thus, for most of the period under Roman rule, Euboea did not show signs of serious economic decline, at least until early Byzantine times, in part because of its marble and in part because of its favourable position in the trading networks used by the Romans.

Euclid

Mathematician of the 4th–3rd centuries BC

Hardly anything is known about Euclid's life (even in antiquity he was sometimes confused with the Socratic Euclides of Megara); even his dates are uncertain. Proclus (5th century AD) knew only that he was later than the pupils of Plato and earlier than Archimedes (which could be inferred from the surviving works of Euclid and Archimedes, and so probably does not rest on independent evidence). Proclus' guess that he lived in the reign of Ptolemy I Soter (305–282 BC) is a reasonable one, but is based only on anecdotes; his claim that Euclid's goal in pursuing mathematics was to give support to Platonism is certainly no more than an attempt to include the best-known mathematician of the ancient world within Proclus' own school.

A number of mathematical works by Euclid have survived. The *Data* defines and discusses what must be "given" in a geometrical proof; *On Divisions* (surviving only in Arabic) deals with problems about dividing figures into parts that have a given ratio to one another; the *Phaenomena* concerns the astronomical applications of spherical geometry; the *Optics* is on the geometrical aspects of optics. Another work attributed to him, the *Catoptrica*, which deals with the geometry of reflection, seems not to be by Euclid in its present form, but may contain much Euclidean material.

These works establish that Euclid was a substantial creative mathematician in his own right, but there is no doubt that he is most renowned not for this, but for a work that is a compilation and systematization of the work of his predecessors, the *Elements*. Euclid was not the first to compose such a work. The first attempt to compile and systematize geometry appears to have been made by Hippocrates of Chios in the late 5th century BC, and this may have been the basis of much of the earlier books of Euclid's work. It is unclear which (if any) parts of the *Elements* are Euclid's own. He certainly made use of Theaetetus' work on irrationals, and Eudoxus' on the theory of proportion (and he uses extensively the mathematical method devised by Eudoxus and usually called "the method of exhaustion"), and there is clear evidence that other sections of the material incorporated in the *Elements* predate him (for example, Common Notion 3, "if equals are taken from equals, the remainders are equal", is cited by Aristotle in a form very close to that of Euclid's own).

The *Elements* is in 13 books (the alleged 14th, on dodecahedrons and icosahedrons inscribed in a sphere, was written by Hypsicles in the 2nd century BC, and the 15th, on the regular solids, is a compilation of the 6th century AD or later). Book 1 begins with a statement of definitions and of the axioms of mathematics, the unprovable and allegedly self-evident assumptions that are the starting point of mathematical proofs (though even in antiquity some of them, e.g. Postulate 5, were controversial). It then goes on to deal with elementary theorems on triangles, intersecting straight lines, and parallelograms. Book 2 deals specifically with rectangles (the view once held that the theorems in this book constitute a kind of “geometrical algebra”, that is a geometrical method of solving quadratic and other equations, is now no longer thought to be probable). The subject of books 4 and 5 is the geometry of the circle and inscribed and circumscribed rectilinear figures. Book 5 is devoted to the theory of proportion; it is probably dependent on the work of Eudoxus, and constitutes one of the most sophisticated and elegant surviving pieces of Greek mathematics. In book 6 the conclusions of book 5 are applied to plane geometry. Books 7, 8, and 9 are on number theory, and book 10 deals with irrationals. Finally, books 11, 12, and 13 deal with solid geometry, with a series of propositions parallel to those on plane geometry in the early books. Though the individual sections are impressive in isolation, Euclid’s real achievement is to bring together a mass of mathematical material and to articulate it into a coherent and ordered system, based on the minimum of axioms.

Euclid’s *Elements* subsequently became the basis of all mathematical education, not only in the Roman and Byzantine periods, but right down to the mid-20th century, and it could be argued that it is the most successful textbook ever written. His clear and logical exposition of mathematics facilitated the process by which geometry became an essential part of the educational syllabus, and a familiarity with its principles an indispensable accomplishment for every educated man. Certainly it helped to establish mathematics as one of the foundations of Hellenic culture, and the discovery of formal proof as one of Greece’s most valuable and enduring legacies. A series of commentaries on the *Elements* demonstrates its continuing importance. The most important of them (on book 1) was written by Proclus in the 5th century AD. Proclus was primarily a philosopher rather than a mathematician, and his commentary stresses the significance of Euclid’s geometry for Neoplatonism. Though the work was undoubtedly designed for students of philosophy who were beginners in mathematics (and may have been based on a series of lectures given by Proclus), there are signs that a general readership was also

envisaged, which, if true, would be evidence of a continuing interest in Euclid's work among a wider educated public.

Like most school textbooks, the *Elements* was adapted by teachers to fit their own needs, and before the 19th century the text universally used was not Euclid's own, but an adaptation of it devised by Theon of Alexandria in the late 4th century AD. Theon corrected what he believed (often wrongly) to be errors in Euclid's mathematics, tidied up his diction, and introduced material (including whole propositions) with the intention of making the argument clearer. There are signs that some of the additions were not Theon's own, but were taken over from earlier adapted texts. It was only with the edition of F. Peyrard, completed in 1818 (and made possible by Napoleon's looting of manuscripts from Italian libraries), that a good text close to Euclid's own was made available. The *Elements* was first translated into modern Greek in 1820.

Biography

The most famous Greek mathematician, even though almost nothing is known about his life. He may have lived in the reign of Ptolemy I (305–282 BC) in Alexandria. Surviving mathematical works include the *Data*, *On Divisions*, *Phaenomena*, *Optics*, and *Catoptrica*. His best-known work is undoubtedly the *Elements* in 13 books. It remained the standard textbook of geometry for 2000 years.

Eudoxus c.390–c.340 BC

Mathematician and astronomer

Though he is reported to have taught at Cyzicus and studied in Egypt, most of Eudoxus' activity is associated with Plato's Academy in Athens, where he was working in the middle of the 4th century BC. None of his writings survives, and so we must reconstruct his work

through reports in later writers. He was clearly a man of very broad interests. Aristotle (*Nicomachean Ethics*, 10. 1172b) reports that in ethics he held that the supreme good is pleasure, on the grounds that pleasure is what all creatures desire; Aristotle remarks that his view attracted support, not from the cogency of the argument, but because of Eudoxus' own reputation for moral rectitude. He is also said to have done work in geography, and to have written a code of laws for his home city Cnidus.

Eudoxus is, however, best known for his work in astronomy. He did a good deal of detailed observational work. He appears to have been influential in marking the sun's annual movement in terms of the 12 signs of the zodiac, and to have introduced the practice of identifying individual stars in constellations by letters of the alphabet. He is the first Greek astronomer of whom we can say with reasonable certainty that he had access to the ancient astronomical knowledge of the Babylonians (though his supposed study in Egypt left no discernible trace); for example, in the placing of the solstitial and equinoctial points in the middle of the appropriate signs of the zodiac (rather than at the beginning), and in equalizing the lengths of the seasons, he is following Babylonian rather than standard Greek practice. His main contribution, however, was to apply contemporary mathematics, and particularly the geometry of the circle and the sphere, to astronomical problems. Both the fixed stars and the sun seem to move round the earth in circular orbits on the surface of a sphere. The moon and the planets, however, appear to move in much more complex ways (indeed the planets sometimes appear to move backwards). Eudoxus' system is an attempt to explain these movements mathematically in terms of combinations of circular orbits, the axes of which were not fixed but rotated around different axes – or, in other words, complex arrangements of concentric spheres. He believed that the movements of the moon and the sun could be explained by using three such spheres for each body, while the five visible planets needed four each, making, with the sphere of the fixed stars, 27 in all. The apparent retrograde movement of the planets is accounted for by having their third and fourth spheres rotate in opposite directions to one another, and around axes at an angle to one another, which produces movement in something like a figure-of-eight; Simplicius tell us that Eudoxus called this figure a *hippopede* (horse-fetter). Despite the mathematical sophistication of this system, it failed to account even for those movements that were well known to astronomers of his time (perhaps the most striking example being the inequality of the seasons). It soon had to be modified (and complicated) by Callippus of Cyzicus, a version of whose system was the one used by Aristotle, and it was later superseded by the more accurate systems of Eratosthenes,

Hipparchus, and Ptolemy. Nevertheless, Eudoxus was the first to make a serious attempt to create a mathematical model of the movement of the heavenly bodies, and so can claim to be one of the founders of scientific astronomy. His system was an entirely mathematical one, and he made no suggestion that we know of as to the mechanism whereby the mathematics could be converted into actual moving bodies.

Important though his astronomical work is, however, there is no doubt that it was his contribution to mathematics that had the most permanent and creative influence. He is said to have been largely responsible for the material on proportion contained in book 5 of Euclid's *Elements*. He is credited with the discovery of a method of handling both commensurable and incommensurable magnitudes, which meant that it became possible to simplify and clarify proofs in a number of important areas, and opened up the way for significant new developments in geometry. Eudoxus seems also to have been responsible for one of the most powerful and characteristic strategies for proof in Greek mathematics, the so-called "method of exhaustion". The name by which it is now generally known is seriously misleading. It is used to relate the areas or volumes of figures bounded by curves to those of figures bounded by straight lines, and its purpose is to avoid the difficulties posed by infinite division; for example, although a polygon can be inscribed in a circle as closely as you like to the circumference of the circle, it can never be inscribed so closely that another polygon cannot be inscribed between the first polygon and the circumference of the circle, and the space separating the two can never be entirely exhausted. Eudoxus' method avoids this problem by proving that, for example, a given polygon encloses an area that can be neither bigger nor smaller than that enclosed by a given circle, and so must be equal to it. This ingenious strategy enabled the solution of many problems (including those arising from attempts to square the circle) and is the basis of much of the geometry of Euclid and Archimedes.

RICHARD WALLACE

Biography

Born c.390 BC at Cnidus, Eudoxus was taught geometry by Archytas and medicine by Philistion. He is said also to have visited Egypt, Cyzicus, and Halicarnassus before settling in Athens to teach, where he was acquainted with Plato. None of his writings survive, but he made important contributions to mathematics and astronomy. He died c.340 BC.

Eunuchs

“Eunuchs” may seem at first sight a jarring entry in an encyclopaedia of Greece and the Hellenic tradition, for eunuchs are primarily associated with the Orient. Indeed the Greeks of the Classical world linked them especially with Persia, where court eunuchs were prevalent, as on the Assyrian model. Herodotus alludes casually to the eunuchs to be found at the Persian court, but also to those in Median and Egyptian circles; in the *Acharnians* (91–122) Aristophanes has the Great King’s Eye report to the Athenian assembly, flanked by two eunuchs; famously, Xenophon in his *Cyropaedia* presents an elaborate justification of the use of eunuchs by king Cyrus; while Ctesias’ *Persica* is full of tales concerning eunuchs at the Persian court.

Yet eunuchs and castration did have a closer proximity to the Greeks. Castration was as much a part of Greek mythology as that of other Near Eastern religions. Hesiod in his *Theogony* (178–200) describes the castration of Uranus’ genitals with a sickle by Cronus, the blood from which was received by Earth who bore the Erinyes, the Giants, and the Meliae nymphs. The genitals themselves were thrown into the sea, from which grew Aphrodite. The effect of the castration of Uranus was disempowerment, and he was replaced by his son Cronus as the supreme deity. Castration also found a place in Greek epics (e.g. the mutilation of Melanthius in the *Odyssey*, 22. 474–77). In the real world, eunuch priests had their part to play in the Anatolian cults of goddesses, notably that of Cybele.

It is clear that eunuchs also impinged more directly on the Greek world. Herodotus records that Periander the tyrant of Corinth sent 330 boys of the leading families in Corcyra (modern Corfu) to the Lydian king Alyattes at Sardis to be castrated, though the people of Samos saved them. Perhaps more reliably, Herodotus states that during the Ionian revolt the Persians threatened to eunuchize Ionian boys, a threat which the historian says came to pass. Herodotus also relates the history of Hermotimus (the most favoured of Xerxes’s eunuchs) who came originally from Pedasus east of Halicarnassus. He was bought as a prisoner of war by a Chian, Panionius, who castrated him as part of his regular trade in eunuchs, whom he would sell at Sardis and Ephesus. Plato even asserts that Callias, a wealthy Athenian in

late 5th-century BC Athens, had a eunuch doorkeeper, though it is vital to remember that Plato was writing a century later. Other evidence for eunuch slaves in Athens is found in Terence's *Eunuch*, which was based on a work of the Athenian playwright Menander; in the extant Roman version the plot revolves around the fact that an Athenian woman has a eunuch slave whose place is taken by an uncastrated male so that he can gain access to the house and seduce a girl. In the 4th century BC Aristotle certainly seems very familiar with eunuch physiognomy, discussing for instance their impotency, gender status, and voice, though his knowledge may be based on the Hippocratic corpus (itself problematic) rather than on personal observation.

With the advent of Alexander the Great, the Greek world came into even closer contact with the tradition of political eunuchism. For when Alexander conquered the Persian empire he did not simply replace it with an extension of the Macedonian kingdom, but sought to present himself as the legitimate ruler of Persia. This entailed his adoption of the Persian royal style and its trappings, including the use of court eunuchs. In all the subsequent Hellenistic kingdoms (with the exception of Macedonia, which maintained its character undiluted) eunuchs are to be found. It is well known that the decision to murder Pompey after his flight to Ptolemaic Egypt following his defeat in the civil war with Julius Caesar was primarily encouraged by the eunuch Potheinus, a key figure in the regency of Ptolemy XIII. Eunuchs feature prominently in the stories of Mithridates VI, king of Pontus. A more unusual case marks the principality of Pergamum; the establishing figure of this was Philetaerus, said to have been eunuchized as a child when crushed in a crowd at a funeral.

With the shift of power in the Mediterranean to Rome, Greek political power took a back seat, but the Hellenistic court style, based on the Persian model, eventually triumphed at the Roman court of late antiquity; as a result of this eunuchs are a striking feature of the history of the later Roman empire. This development is associated primarily with Diocletian (284–305), who seems to have enhanced imperial status and ceremony to promote the authority and security of the emperor.

Euripides c.480–c.407/06 ^{BC}

Tragedian

Euripides spent the last two years of his life as a guest of Archelaus in Macedonia. He won his first victory in 441 ^{BC} and three others in his lifetime (including one with the trilogy that contained *Hippolytus* in 428 ^{BC}, and an additional one for the posthumous performances of *Iphigenia in Aulis* and *Bacchae* in 405 ^{BC}). Although he later became the most popular Greek tragedian, in his own lifetime Euripedes was less successful than Aeschylus and Sophocles.

Nineteen of his plays, out of some 90, survive (one of which, *Rhesus*, is probably by a later poet), including our only complete satyr play, *Cyclops*. In addition to the ten plays that survive because they were the most commonly read in the Hellenistic and Roman periods, a further nine survive through a lucky accident: they were preserved in a manuscript that presents them in a quasi-alphabetical order (they evidently formed one part of a collection representing *The Complete Euripides*). In addition, there are extended fragments of the *Antiope*, *Alexander*, *Archelaus*, *Bellerophon*, *Cresphontes*, *Cretans*, *Erechtheus*, *Hypsipyle*, *Captive Melanippe*, *Wise Melanippe*, *Phaethon*, and *Stheneboea*.

The dates of performance for nine of Euripides’ surviving plays are known, and others are tentatively proposed on the basis of evidence provided by the scholia or other writers or of his own developing metrical practice: *Alcestis* (c.438 ^{BC}), *Medea* (c.431), *Heraclidae* (c.430), *Hippolytus* (c.428), *Andromache* (c.425), *Hecuba* (c.424), *Suppliant Women* (c.424–420), *Electra* (c.422–416), *Troades* (c.415), *Heracles* (c.415), *Iphigeneia among the Taurians* (c.414), *Ion* (c.413), *Helen* (c.412), *Phoenissae* (c.409), *Orestes* (c.408), *Cyclops* (uncertain), *Iphigeneia at Aulis* (c.405, posthumous), *Bacchae* (c.405, posthumous), and *Rhesus* (possibly post-Euripidean).

Euripides has been called the first psychological playwright. Longinus praised his depiction of madness and love (*On the Sublime*, 15. 3). Aristotle says that Sophocles claimed that he depicted men as they ought to be and Euripides as they were (*Poetics*, 1460b33ff.). Whereas in Aeschylus god confronts god, and in Sophocles man confronts god, in Euripides man confronts man, or woman, and often

himself or herself. Only Medea can stop Medea: her main debate is with herself. In the works of other playwrights the traditional heroes are endorsed; Euripides focuses instead on women, children, and slaves. He shows us women doing noble acts (e.g. Iphigeneia, Macaria), children acting nobly (both characters just mentioned, and Menoeceus in *Phoenissae*), and the figure of the noble slave (e.g. in *Helen*).

Euripides questions traditional beliefs and attitudes, and his plays feature debates that were also popular among the Sophists of his time. In these debates both strong emotions and strong intellectual positions are expressed; examples are Hippolytus' confrontation with Theseus (*Hippolytus*) and Hecuba's with Helen (*Trojan Women*). This bothered many critics in the 19th century who would have preferred inspired emotionalism without philosophical debate (see Nietzsche's condemnation of Euripides for just this rationality, which he considered a debasement of the noble goals of tragedy).

Aristophanes' *Frogs*, which highlights a contest between Aeschylus and Euripides, shows the latter as an innovator and an iconoclast. It is from Aristophanes that we get the dubious impression that Euripides was a misogynist. He was instead a scientist of the emotions and focused on unconventional, passionate women. It may have been his idea to have Medea kill her children, the ultimate revenge against the husband she hated. His psychological characterization is outstanding; he gave the first instance of a guilty conscience (*Orestes*, 395–96), described as an internal disease rather than an externally imposed punishment as we find in Aeschylus and Sophocles.

Euripides' language is accessible, and at times colloquial. His structure varied from the most organized and conventional (*Bacchae*, *Iphigeneia among the Taurians*) to loose and episodic (*Trojan Women*, *Iphigeneia at Aulis*). He specialized in arias to enhance emotional states; he also excelled in debate (*agon*) as a revelation of character. His choruses can range from being integrated with the plot, to the less relevant. This may reflect a trend of the time.

There were regular revivals of Euripides' work after 386 BC. Around 330 BC the Athenian politician Lycurgus prescribed that copies of the texts of the plays should be deposited in the official archives, and that future performances should conform to these texts. The purpose was to safeguard the plays from adaptation and interpolation by actors and producers, of a kind to which they had already become vulnerable. These copies were lent to the Egyptian king Ptolemy I Euergetes, and will have passed into the Library at Alexandria, to form the basis of the critical edition made by the librarian Aristophanes of Byzantium (c.257–180 BC). Aristophanes divided the lyrics (previously written as continuous prose) into metrical cola. He also added brief introductory

comments, probably making use of Aristotle's lost *Didaskaliai* (production records). Part of these comments survive in the *hypotheses* (plot summaries) that were prefixed to the plays by later scholars in the Roman period. The composition of commentaries (scholia) on the plays was begun in the Hellenistic period (by scholars such as Aristarchus of Samothrace, ?217–145 BC, and Didymus, ?80–10 BC). Further scholia were added in the Byzantine period.

The Romans prized Euripides, and Ennius (239–169 BC) wrote adaptations: *Andromacha*, *Hecuba*, *Iphigenia*, and *Medea*; Pacuvius (c.220–130 BC), *Antiopa*; and Accius (170–?86 BC) *Alcestis*, *Bacchae*, *Hecuba*, *Medea*, and *Troaïdes*. Half of the plays by Seneca (?AD 1–65) are from Euripides: *Hercules* [*Furens*], *Troades*, *Phoenissae*, *Medea*, and *Phaedra*.

The selection of the ten “school edition” plays that we possess was probably done in the 2nd or 3rd century AD, and scholia were included. After parchment gradually replaced papyrus (around the 4th century AD) the unselected plays gradually passed out of use. Stobaeus' anthology (5th century) of gnomic sayings often quotes lines from Euripides, including many from the lost plays. After the Athenian Academy was closed in AD 529, the Classical texts disappeared from sight for several centuries and did not re-emerge until the revival of learning in the middle Byzantine period, when they were copied from the uncial into the new cursive script. Among the scholars who wrote commentaries and handled the texts of the plays the most important are Thomas Magister (late 13th century), Manuel Moschopoulos (fl. 1300), and Demetrios Triklinios (early 14th century). Triklinios brought a new metrical awareness to the amendment of the text, in particular the lyrics.

The nine alphabetical plays mentioned above are preserved only in two 14th-century manuscripts, L and its copy P. The earliest manuscript is the Jerusalem palimpsest from the 10th or 11th century and it includes the school selection. The Euripidean plays most commonly read in Byzantine times were *Hecuba*, *Phoenissae*, and *Orestes*. *Christus Patiens* was a play written in the 11th or 12th century on the passion of Christ using lines from Euripides, Aeschylus, and Lycophron, and some of the ending of the *Bacchae* has been reconstructed from it.

Medea, *Hippolytus*, *Alcestis*, and *Andromache* were first printed in Florence about 1494; an edition of 18 plays followed in 1503; *Electra* was not published until 1546. For the next 400 years there were revivals and reworkings of Euripides' plays in Europe, most notably by Racine, Goethe, Schlegel, and many others. In the 20th century Euripides is the playwright of social protest par excellence.

There have been many performances of Euripides' plays in modern

times in Greece. A few of the most notable are: *Alcestis* in 1901 (music by Gluck, direction and translation by Constantinos Christomanos) and 1934 (Karolos Koun, director, and set by Giannis Tsarouchis); since 1868 *Medea*: 1942 (Takis Mouzenidis, director, music by Manos Hadzidakis), 1956 (Alexis Minotis, director, music by Hadzidakis, starring Katina Paxinou), and 1989 (Aspasia Papathanasiou, director and star); *Hippolytus* since 1897: in 1937 (Dimitris Rondiris, director, Dimitris Mitropoulos, Alexis Minotis as Hippolytus, and Katina Paxinou as Phaedra) and 1965 (Dimitris Rondiris, director, music by Dimitris Mitropoulos; Aspasia Papathanasiou as Phaedra); *Bacchae* was notably done in 1962 (Alexis Minotis, director, music by Hadzidakis, Alexis Minotis as Kadmos, Basilis Kanakis as Pentheus, Katina Paxinou as Agave), 1977 (Karolos Koun, director), and 1986–88 (Theodoros Terzopoulos, director, with his Attis theatre). Mikis Theodorakis's opera *Medea* (1991) is a parable of the history of Greece.

There are many films based on Euripides; Cacoyannis's *Trojan Trilogy* is based entirely on his work, with *Electra* (1961), *Trojan Women* (1971), and *Iphigeneia* (1976), all protesting in their own way against unjust oppression; Mikis Theodorakis composed the music for these films. Jules Dassin filmed *Phaedra* (1962) with a social message, contrasting the mass tragedy of loyal workers with the personal tragedy of dissolute jet-setters; he also based his *Dream of Passion* (1978) on *Medea*. Pasolini's *Medea* (1967) dealt with the myth behind the play in psychological and anthropological terms.

MARIANNE McDONALD

Biography

Born c.480 BC in Phyla, Euripides moved to Athens in childhood and first competed in the city Dionysia in 455 BC, winning his first victory in 441. He won four other victories (including one posthumously in 405). Of about 90 plays written, 19 survive (one of them spurious), including our only complete satyr play. He was less successful than Aeschylus and Sophocles in his lifetime but more popular than them later. He died in Macedon c.407/06 BC.

Evagoras c.445–374/73 BC

Ruler of Cypriot Salamis

For much of the 5th century BC Cyprus was a bone of contention between the Greeks and Persia. When in 449 BC Athens, the leading Greek maritime power, and its alliance (the Delian League) were forced to come to terms with the Great King (the so-called Peace of Callias), whereby Cyprus was conceded as belonging within the Persian sphere of influence, the Greeks of Cyprus were effectively left to fend for themselves. The Persian-backed Phoenician minority quickly gained the ascendancy and Phoenician kings were imposed on a number of Greek Cypriot cities, including the most important, Salamis, which had been ruled by the Teucrid dynasty since the city's foundation at the close of the Bronze Age. A member of this dynasty, the youthful Evagoras, was forced to flee, but he returned a few years

later (possibly in 415/14 BC), perhaps with Athenian help, expelled the Phoenicians, and restored Greek royal rule. It is commonly believed that Evagoras immediately submitted to Persia and paid tribute, but this is unlikely. At any rate his actions in helping Athens, an enemy of the Great King, do not point to such a conclusion.

The evidence for the career of Evagoras is none too plentiful and much of it is equivocal, but on balance it seems to point to his having been from the very start fixed on the policies we see him pursuing in later years. The development and strengthening of Salamis was the first and indispensable step to unifying the island under his rule and wresting it from Persian control. Close ties with Athens, the heart of Hellas, and the full Hellenization of the island went hand-in-hand with this aim. It should be stressed that Hellenization in the Cypriot context meant (for the Cypriot Greeks at least) a process of catching up with their fellow Greeks. Having lived in relative isolation for many centuries, the Cypriots still adhered to older ways of living and thinking.

By 412 BC Evagoras had rendered Athens, locked as it was in a life-and-death struggle with Sparta (the Peloponnesian War), services sufficiently important for both him and his sons to be rewarded with the city's citizenship. In 405 BC, when the Athenian fleet was destroyed by Sparta, the Athenian general Conon, with a number of warships and many hundreds of Athenians, took refuge with Evagoras in Cyprus. Together Conon and Evagoras planned the defeat of Sparta and the restoration of Athenian power. Because Persian money and resources were necessary for this, Evagoras made his peace with the Great King and agreed to be his tribute-paying vassal. In 394 BC at Cnidus the Spartan fleet was decisively defeated by a Persian-financed force led by Conon. The Spartan naval hegemony was over. A grateful Athens heaped honours on the two men, including the setting up of their statues in the Agora next to the image of Zeus Soter, an unprecedented and extraordinary gesture, extended only to two other men, Timotheus, the son of Conon, and, centuries later, Hadrian, the great Roman emperor and philhellene.

Evagoras now turned his attention to the unification of Cyprus, which meant the subjection of the other city kingdoms of the island, all of them tribute-paying clients of Persia. He seems to have been well on the way to achieving this when the Great King, fearful and suspicious, resolved to strike first and restore the status quo. War broke out around 390 BC and lasted for some ten years. Allied with Athens, who repeatedly sent ships and troops to the island, and Egypt, Evagoras initially went from success to success. He captured Tyre and caused much of Phoenicia and Cilicia to revolt against Persia. Citium in Cyprus, the main Phoenician stronghold on the island and always

strongly pro-Persian, nevertheless held out, and the tide definitely turned against Evagoras when Sparta and Persia enforced the King's Peace in Greece in 386 BC. A central clause of the peace recognized Greek Asia and Cyprus as belonging to the Great King. Athenian forces evacuated the island and Evagoras stood alone, bereft of his vitally important Greek support. A mighty Persian armada invaded the island, probably in 385 BC, and though Evagoras fought well and bravely, and with considerable initial success, in the end he found himself besieged in Salamis and was forced to come to terms. He was still strong enough, however, to resist complete subjection to Persia and to insist instead on being granted his previous status of an autonomous, but tribute-paying, client king. He died a few years later, assassinated with his eldest son, in rather mysterious circumstances in 374/73 BC.

One of the most eminent of British historians summed up the career of Evagoras thus: "There are few more striking demonstrations in Greek history than the attempt ... of Evagoras of Salamis, with the limited resources of a small island, to challenge the great Persian empire and to make Cyprus more Greek than Greece" (J.B. Bury in *A History of Greece*, edited by Bury and R. Meiggs, 3rd edition 1951, p.73). That contemporary Greece, and in particular Athens, whose honorary citizen he was, would have concurred fully with this judgement is proved not merely by the high praise of the prominent Athenian orator Isocrates (above all in his pioneering oration, the *Evagoras*), but also by two new fragments (identified in 1979) of the stele bearing the decree voted in honour of Evagoras by the Athenian assembly in 393 BC (D.M. Lewis and R.S. Stroud, *Hesperia*, 48 (1979): pp. 180ff.). It would appear that the public herald was to proclaim on the occasion of a dramatic festival, *inter alia*, that Evagoras had done his duty by Greece and Greek freedom as a Greek ought.

While Evagoras' policy of the further Hellenization of Cyprus met with much success (the wholesale importation of Athenians and their culture left an indelible mark on the island), his political aims failed. After so many years of war, which exhausted the resources of Salamis, he was at the end no nearer his purpose than when he began. Nevertheless, his goal of a united island that would moreover form part of the wider Greek world, and the tenacity with which he pursued it, lived on to inspire the modern Greek Cypriots in their own equally long struggle for national rehabilitation.

P.J. STYLIANOU

Biography

Born c.445 BC as a member of the ancient Teucrid dynasty of Cyprus, Evagoras was at first forced to leave the island but returned c.415/14 to expel the Persian-backed

Phoenicians and restore Greek rule. Allied with Athens, he united most of Cyprus. After the King's Peace (387/86) he defied the Persians and secured honourable terms. He was assassinated in 374/73 BC.

Evil Eye

Many elements of belief associated with commonly held ideas of the evil eye are evident throughout the Greek tradition from antiquity to the present day. While the basic notion of the evil eye, that harm or damage may be caused by a glance, is found unequivocally at many points in this tradition, it is probably more helpful to see it in the context of a larger group of beliefs evident in Greek thought, which involves the idea that change in physical or emotional condition may be effected in humans, animals, and inanimate objects by means of the power of sight alone and without obvious physical contact. The ability to cause such change is not confined to human beings, for it is also attributed to various supernatural powers and forces; nor is the change thought to be necessarily evil, although it is without question most commonly associated with bad effects and the fear that an envious, jealous, or perhaps hateful glance may cause serious harm is particularly prominent. Care is to be exercised in relating the Greek tradition concerning the evil eye to superficially similar but often significantly divergent ideas found in a broad range of cultures around the Mediterranean and beyond.

Firm literary evidence for the existence of many elements within this complex of ideas goes back at least to the early Classical period, while cross-cultural comparison and archaeo-logical evidence may well suggest that such beliefs were present in some form from the very beginnings of a recognizable Greek culture. Phrases directly equivalent to the term "evil eye", such as *vaskanos ophthalmos* or *ophthalmos poneros*, are attested only from later antiquity, but writers throughout the pagan tradition such as Aeschylus, Plato, Theocritus, Callimachus, Apollonius Rhodius, Libanius, and Heliodorus allude in a wide variety of contexts to the closely related idea of the malignant

and communicable power of envy (*phthonos*) or jealousy (*vaskania*); indeed, it is probable that the verb *vaskainein* in ancient Greek is to be taken primarily as meaning “to bewitch”, very much in the sense of casting the evil eye through jealousy. Kindred notions are also found in the powers attributed to the gorgon and basilisk of Greek myth. Plutarch (*Quaestiones Convivales*, 5. 7. 680–83) provides the fullest discussion of the topic in antiquity and proposes that the eyes of a jealous person emit a stream of particles that strike the victim and so transmit harm, a theory of explanation close to one suggested by Democritus (to which he alludes) and followed by several later writers. As Plutarch also reveals, the notion of malignant envy or the evil eye was sometimes treated with suspicion and scorn in antiquity, but nevertheless its persistence in the Greek tradition as a whole attests to its general acceptance.

A number of passages in the New Testament (e.g. Matthew 20: 15, Mark 7: 22, and Galatians 3:1) are connected with this tradition and Church Fathers, such as Basil, John Chrysostom, and Eusebius, discuss the belief and its implications for Christianity. All conclude that the apparent power of the evil eye is to be attributed to the activity of the Devil, but all fail to deny completely the validity of the idea. Given the inability of such intellectual early Christian authorities to do so, it is not surprising that the literary and material record from the Byzantine period down to the present day indicates a widespread popular belief in the power of the evil eye and in apotropaic practices associated with it, many of which are scarcely Christianized.

Belief in the evil eye is thus very widely attested, though not universally accepted, in the popular culture of modern Greece. The term generally used is *kako mati* (evil eye) or simply *to mati* (the eye), although there are many other local and regional expressions, most derived in some way from the *ophthalmos* (eye) of ancient Greek (e.g. *thiarmos* in western Crete). Symptoms associated with “the eye” tend to be ill defined, since specific indications will normally suggest a more conventional diagnosis, but in general everything thought to have been affected by it will show signs of sickness and loss of function. Symptoms in adults commonly include a feeling of malaise or depression, yawning, chronic feverishness, nausea, or headache; young children may sleep badly, lose their appetites, or cry constantly; animals will display signs of weakness, lethargy, and infertility; crops will fail to grow or will wither; and machinery will cease to function properly. Despite its vague symptoms the evil eye is thought to be very serious and, if left untreated, potentially fatal.

Explanations of the cause of the evil eye focus most usually on perceived jealousy or envy. It is commonly associated either with over-zealous admiration to the point at which the thing admired is

actually coveted or else with the expression of insincere admiration. Some individuals are thought particularly likely to cause it, perhaps because of their social situation (e.g. elderly spinsters) or their unpleasant demeanour, while physical characteristics, such as blue or green eyes (usually an indication of foreignness), may also be thought to be signs of danger. Occasionally it may be thought to have been deliberately induced by magic. The view that the evil eye may be cast unknowingly and without any deliberate intent is, however, also widespread, making both detection of origin and prevention very difficult.

Practices to avert the evil eye are numerous and varied. Among the most common objects employed are cloves of garlic, blue beads or thread, the image of a staring eye (usually blue), and Christian symbols and objects such as the cross or an amulet containing holy material; these are either worn or placed in contact with whatever is being protected. Other techniques involve such things as spitting after making a compliment, or the invocation, either aloud or silently, of a spell or prayer.

Diagnosis and cure of the evil eye are also performed in a wide variety of ways, many of which show strong regional and local characteristics. Healers, often women, are to be found and openly acknowledged in most villages and towns. Among the commonest methods of diagnosis and cure, which usually form a single ritual, are those that involve dropping a substance or object (often oil but perhaps salt, incense, charcoal, or a cross) into a vessel of water. Affliction is determined through the behaviour of the material in the water, and, in the curative phase of the ritual, victims will drink some of the water or have it sprinkled on them; sometimes the healer will exhibit the victim's previous symptoms. The rituals, whatever their precise nature, are accompanied throughout by spells or prayers that almost always involve at least some overtly Christian elements, although these are often used in ways that are far from orthodox. Indeed, the Church, doctrinally speaking, disapproves of the popular notions of the evil eye since these tend to challenge the central Christian principle of the omnipotence and goodness of God. Nevertheless an acceptable explanation is found by seeing the supposed power of evil eye as a manifestation of the familiar activity of the Devil or his demons operating through humans, and the Orthodox Church has available, at least at a local level, a fully Christian ritual for removing it.

Execias

Potter and painter of the 6th century BC

Execias worked as a vase painter from about 545 to 530 BC, but his career as a potter started earlier: his signature is recognized on an amphora representing Heracles and Geryon (now in Paris, Louvre F 53, from Vulci), which is assigned to the so-called Group E, as well as on a number of cups (e.g. Munich, Antikensammlungen 2044, from Vulci). He signed a neck amphora (Berlin, Staatliche Museen 1720, from Vulci) and a type A belly amphora (Vatican Museums 344, from Vulci) as both potter and painter: "Execias painted and made me". Execias' great contribution to the Athenian black-figure tradition lies in his potting as well as his painting. Although the number of vases attributed to him is not large, the range of shapes is very wide, including amphorae (type A and type B), neck amphorae, a Panathenaic amphora, a *dinos* (goblet), a *pyxis* (box), cups, a calyx crater, and funerary plaques. He was responsible for the development of the type A cup and the type A belly amphora – both vases are of large size, around 60 cm high – and probably invented the calyx crater since the earliest surviving example was decorated by him (Athens, Agora Museum, from the Acropolis north slope). He

demonstrated a preference for amphorae, especially of the neck type and of type A, identified by its decorated flanged handles and a stepped foot.

The influence of the earlier Group E has been observed in his work, especially in his painting style as well as in his choice of ornaments and shapes. His scenes are simple, including only the essential elements of a composition. He demonstrated, however, an interest in the detailed representation of armour, manes, hair, and drapery, and experimented with the rendering of three dimensions. His workmanship is characterized by precision and his scenes of action by originality, since he seldom used standard motifs or compositions. He preferred to interpret well-known scenes anew, such as Ajax carrying Achilles, or invent others, such as Dionysus in his ship.

Execias has been considered a master of narration; by eliminating extraneous figures from his scenes, he focused on just those essential for his story. Despite the limitations of the black-figure technique, he often attempted to render some degree of emotion on the faces of his figures without distorting them, as on the mourners' faces on his funerary plaques. He preferred scenes that displayed strong tension in a subtle way, while occasionally depicting the moment before the action, as in the scene of Ajax's suicide (on a belly amphora, Boulogne Museum 553, France). In these respects Execias could be considered the forerunner of the Classical style.

Just as Execias had a liking for certain vase shapes, he also favoured specific patterns framing his pictorial scenes. Chains of lotuses and palmettes with separated and finely drawn leaves ornamented the neck or framed the panels of amphorae. The handles of his type-A amphorae are decorated with a tendril of ivy leaves.

His originality is also expressed in other forms. He broke the Attic convention of a tondo in the interior of cups and painted Dionysus sailing across the interior of a *kylix* (wine cup, Munich, Antikensammlungen 2044, from Vulci). Both the "coral-red" background of the scene and the pair of eyes decorating the exterior of the cup seem to be his inventions. Moreover, he was the first painter to depict ships sailing around the rim of a *dinos* (Rome, Villa Giulia Museum 50599). Execias often named not only his heroes but also their horses, the representations of which are classified among his favourite subjects.

Execias' iconographic repertoire is based on mythological scenes, especially those related to the Trojan War, but few of them followed established patterns. Unlike his contemporaries, he showed a lack of interest in the secular *komos* (revel) and the symposium, while the sole scenes from everyday life that he depicted are the *prothesis* (laying out) and the *ekphora* (carrying to burial) of the dead on

funerary plaques. His Trojan scenes are devoted to episodes from the lives of Ajax and Achilles or to the events leading to their deaths and do not follow the versions of the myth found either in the *Iliad* or in any other of the known literary texts. Thus, Execias depicted Ajax and Achilles playing a board game – the scene appears here for the first time in Greek art and was repeated numerous times in vase painting thereafter – Ajax's suicide, Achilles killing Penthesilea, Ajax lifting the dead Achilles from the ground, the dead Patroclus fought over by Hector and Diomedes, as well as scenes with Memnon. Although Execias does depict the heroes Heracles, Theseus, and the Dioscuri, it was the two Trojan heroes that prevailed in his scenes. It has therefore been suggested that Execias countered the heroic virtue that other artists portrayed through Heracles by his use of Ajax and Achilles.

Although Execias' interest in Heracles was not remarkable, the scene with Heracles wrestling with the lion introduced to Athenian vase painting the composition of the lion fight in a prone position. His treatment of the Dioscuri is also innovative: he represented the homecoming of Castor before Polydeuces and their parents, Leda and Tyndareus. Previously the two heroes had appeared either at the Calydonian boar hunt or at the wedding of Menelaus and Helen. Execias was less interested in the depiction of a specific mythological event than in the heroes themselves.

ELENI ZIMI

Biography

Execias of Athens was active as a painter and potter from about 545 to 530 BC. He signed two amphorae as both potter and painter and his contribution to Athenian black-figure vase decoration is recognized as combining both activities. He departs from convention to depict both the character of his subjects and the tension of the moment.

Exile and Detention

Myth repeatedly describes individual banishment, usually for murder, but also for incest and other forms of sacrilege, as religious purification of a whole community. The outcast, interdicted from fire and water, deprived of ancestral worship, and cursed with all his issue, was deemed legitimate prey for any man. His only possible safety came from supplication at alien shrines or courts, and mere sufferance was often his most ambitious hope. Survival of this religious element of banishment into the time of the city state can be illustrated by *inter alia* a historical event and a festival at Athens. Some years after Megacles, the head of the Alcmaeonidae, had in 632(?) BC sacrilegiously allowed the suppliant supporters of the defeated Cylon to be slain, not only was the whole clan exiled but the bones of its dead were exhumed and cast beyond the borders of Attica. At the purificatory festival of Thargelia in honour of Apollo, Athens still included in the Classical period the practice of beating and driving beyond its borders two *pharmakoi* (scapegoats) who at least theoretically took the evils of the city with them.

Banishment in the Archaic, Classical, and Hellenistic periods could be suffered by whole communities, groups, and individuals. Inhabitants of conquered cities were at the mercy of their victors, who sometimes chose to drive them out. That they could often then keep a sense of communal identity was due to allies who gave them shelter within their walls or found them land to settle, and they often later managed to regain their homes (all three of these fates befell the Plataeans driven out by the Thebans at the beginning of the Second Peloponnesian War). The survivors of the citizens sold as booty when Philip II sacked Olynthus in 348 were settled 32 years later by Cassander in his new foundation of Cassandreia.

Greek historians frequently do not make clear whether groups (or individuals) were exiled or fled voluntarily. In most cases their removal was due to governmental change in the struggles between tyrants, oligarchs, and democrats. Nearly all these exiles were from the upper classes, and could stay with sympathizers or had connections in other states, and frequently returned home at a change of government (that they themselves sometimes engineered) or upon an amnesty.

Individual exile was largely a political weapon. Most victims were politicians or generals, who suffered for real or alleged treason, military failure (as in the case of the historian Thucydides), or just unpopularity. The punishment, that was for either life or a set number of years, could be severe because it usually entailed deprivation of civic rights and confiscation of property. An exile returning illicitly ran the risk of summary execution; anyone harbouring an exile

became himself liable to expulsion. Individual recalls and general amnesties were not, however, uncommon: Diodorus Siculus states (18. 8. 5) that according to Alexander the Great's decree in 324 BC, 20,000 Greek exiles were permitted to return to their homes. Voluntary exile could be chosen to avoid trial and even after the sentence of death had been passed (Socrates famously refused his friends' request to go into exile). In the 5th century BC the Athenian *ekklesia* was enabled to vote in favour of holding an ostracism, whereby if at least 6000 citizens took part the man whose name was recorded on the highest number of *ostraka* (potsherds) was exiled, without loss of citizenship or property, for ten years. Aristotle claims (*Athenaion Politeia*, 22) that the law was introduced by Cleisthenes in 508/07 BC, but the first ostracism was not held until 487. The last man ostracized was the demagogue Hyperbolus between 417 and 415, after which the *graphe paranomon* (indictment for offence of proposing an illegal law or decree) became the preferred means of attacking politicians. Forms of ostracism were employed also at Argos and at Syracuse – at the latter it was called *petalismos* ("leafing") since the names were written on olive leaves.

Information on detention is scant and largely Athenian. Non-productive long-term incarceration was extremely rare, its function served by deprivation of civil rights. Short-term incarceration, however, was occasionally used, sometimes in addition to a fine: otherwise the prison in Athens, under the supervision of the Eleven, held men on remand for certain crimes (e.g. maltreating parents or failing in military duties), men delinquent in the payment of some categories of fines, and men awaiting execution. Soldiers captured in battle were usually executed, taken or sold into slavery, exchanged, or ransomed. Occasionally they were held in detention as hostages, sometimes later to be exchanged (e.g. the Spartiates held by the Athenians in the city and elsewhere in their empire for nearly four years after their capture on Sphacteria in 425 BC). In contrast, the survivors of the Athenian expedition against Syracuse in 415–413 were imprisoned for life in nearby stone quarries, where some years later the dithyrambist Philoxenus, temporarily imprisoned for adversely criticizing the poetry of the tyrant Dionysius I, wrote one of his more famous pieces.

The most innovative penal theorist was Plato, who in his *Laws* prescribed varying terms of imprisonment and exile for different classes of criminals (citizens, metics, visiting foreigners, and slaves) and different crimes. More revolutionary, in addition to a large general and a purely punitive prison, he envisaged a reformatory (*saphronisterion*), where suitable offenders convicted of impiety were to be subjected to at least five years of counselling before being

reintegrated into society (recidivists were, however, to be executed). Plato's ideas were largely ignored in antiquity.

Greeks under Roman rule were subject to Roman law, which, with modifications, survived in the Greek world until the Ottoman sack of Constantinople in 1453.

F

Fable

A fable (*ainos*, *logos*, *mythos*) can best be defined as a fictitious, metaphorical narrative. It has been asserted that fables typically are about animals and have a moral purpose, but these restrictions do not take into account the genre's historical multiformity: fable collections traditionally include stories with rational as well as irrational characters, and the genre's functions may vary widely, notably from persuasive to satirical, from moral to explanatory, from didactic to illustrative. It is to this flexibility that the genre owes its remarkable, millennia-long vitality.

Throughout ancient literature fables are used in a variety of other literary genres. The oldest extant Greek fables occur in Archaic Greek epic (Hesiod) and lyric poetry (Archilochus, Semonides, Stesichorus, Ibycus, Simonides). In the Classical period fables are adduced in both prose and poetry; they are applied not only by tragedians (Aeschylus, Sophocles), satyric playwrights (Achaëus), and comedians (Aristophanes), but also by historiographers (Herodotus), rhetoricians (Aristotle), orators (Demosthenes (allegedly)), and philosophers (Socrates (allegedly), Plato, Xenophon). From the Classical period onwards fables are typically connected with the name of Aesop, the legendary fabulist. By then, already, fables were apparently so popular that authors could confine themselves to mere allusions, obviously presupposing the audience's knowledge of the rest of the story.

At the beginning of the Hellenistic period Demetrius of Phalerum compiled the first fable collection, probably an anthology of fables excerpted from the works of Archaic and Classical authors, made up as a repertory for orators looking for a fable that could appropriately be used in some speech or situation in accordance with the advice given by Demetrius' teacher Aristotle in what is the oldest extant treatise on fable as a genre (*Rhetoric*, 2. 20). Regrettably enough, Demetrius' collection has been lost but for its title (*Collections of Aesopic Fables*), preserved by Diogenes Laertius.

The extant fable collections all date from the imperial period of Greek literature. Most are in prose. Of the oldest one only fragments of 14 fables remain (*Rylands Papyrus* 493; early 1st century AD). The verse collection by Babrius (late 1st or 2nd century AD) has also been incompletely preserved, but 144 fables have come down to us in their original form, whereas knowledge of what has been lost may be gained from prose paraphrases. The largest collection is the so-called

recensio Augustana (see below), consisting of 231 allegedly Aesopic, but really anonymous, prose fables concluded by *epimythia* (less felicitously called “morals”). In addition, we have three small prose fable collections, probably used in rhetorical education. One, by Aphthonius (4th century AD), includes 40 fables, all equipped with both a *promythion* (an introductory moral, serving as title) and an *epimythion*; another, by his contemporary Libanius, has only three fables; a third, anonymous collection (*Codex Brancatianus*) contains 14 fables with iambic *epimythia*.

At the same time, fables continued to be used in other literary genres. In the Hellenistic period fables are adduced not only by poets such as Callimachus and Nicander and by epigrammatists (Leonidas), but also by historiographers (Theopompus, Diodorus Siculus) and philosophers (Philodemus). In the imperial period fables occur not only in traditional genres – notably historiography (Dionysius of Halicarnassus, Flavius Josephus), oratory (Aelius Aristides, Dio of Prusa, Themistius), and philosophy (Philo) – but also in new genres such as epistolography (Julian, Libanius), romance (Aesop romance, Alexander romance, Achilles Tatius, Heliodorus), and biography (Plutarch).

Simultaneously, the theory of the fable was also studied. Of great importance is the treatise on fable by the rhetorician Theon (late 1st century AD), who formulated the oldest extant – and, according to some, the best possible – definition of the genre: “a fable is a fictitious story that gives the semblance of reality.”

The polytheistic background of the ancient fables, traditionally featuring “pagan” gods, did not prevent the early Christian writers from using them in their own works, witness references in poems by St Gregory of Nazianzus, in epistles by St Basil the Great and St Gregory of Nyssa, in homilies by St John Chrysostom, and in apologetical works by Epiphanius of Salamis and Theodoret.

Byzantium preserved the heritage of the ancient fable tradition. On the one hand, the fables from antiquity were copied and paraphrased; on the other, they inspired Byzantine fabulists to write new versions or original fables of their own. The anonymous prose fables must have been very popular, demonstrated by the great number of manuscripts that regularly combine the “Aesopic” fables with the *Life of Aesop*. The fable collections can be subdivided into three classes, named after the library where its principal manuscript was found, or after its editor: the ancient *Augustana* (Augsburg); the Byzantine *Vindobonense* (Vienna; 127 fables); and the *Accursiana* (Bonus Accursius; 130 fables). They are also called, respectively, *recensio* I, II, and III: II is mainly based on I and Babrius, III on I and II. The exact date and purpose of these collections are still under debate.

Fairs and Markets

“Landings, sailings, numbers of people and goods and ships: these prove the merit of a fair, a harbour, or a market”, said Dio of Prusa in the 1st century AD. Evidence of Greek fairs and markets is scattered and piecemeal. Demosthenes and Aristophanes are among sources for the Classical period; Hellenistic inscriptions supply details of trade regulations at fairs; in Roman times, special coin issues, commemorating local festivals, imply busy economic activity there.

The agora was the central public space of an ancient Greek city. The word also denoted the activity of a market, whether it took place in that public space, at a fair, or at a harbour.

In Classical Greece fairs (*panegyreis*) were chiefly religious festivals, but trade was a part of almost every *panegyris*. Thus, at a festival at Andania, “the priests shall indicate a place for all sales. The city *agoranomos* [market supervisor] shall ensure that sellers sell fairly and cleanly and use the city’s weights and measures. He shall not restrict the sellers as to volume of sales, or as to time, or charge them for the site” (no. 65, lines 99–107 in *Lois sacrées des cités grecques*, edited by Franciszek Sokolowski, Paris: Boccard, 1969). An Amphictyonic decree of the 2nd century BC prescribes currency equivalents to be operated by “the money changers who sit in the cities or at the *panegyreis*”. Fairs, often lasting several weeks, could be interrupted by a city’s periodic market. At Oenoanda, in western Asia Minor, the quadrennial festival was suspended on the sixth of the month, the regular market day.

Some fairs attracted dealers and customers for a range of merchandise: in Roman times the twice-yearly fair near Tithorea in Phocis sold “slaves, cattle of all kinds, clothes, silver, and gold” (Pausanias). Other fairs too, including the Pylaea at Delphi, were noted for slaves. Domestic animals are mentioned in several sources as a typical purchase at an annual fair.

Fairs often attracted tax-free status, *ateleia*. Some fairs were held in cities or just outside them; others traditionally took place far from any centres of population, like the mountain-top fairs still known in the Balkans and first mentioned in a work attributed to Aristotle (*On Marvellous Things Heard*, 104).

The great religious festivals were major commercial events.

According to the Roman historian Livy: “The Isthmian Games had always been well attended ... because of their excellent location, which enabled the Isthmus to deal in all kinds of commodities imported over two different seas. The market there was a fair for Asia and for Greece” (*Ab urbe condita*, 33. 32. 1–3, abridged).

In the Hellenistic period the regular political gatherings of the Aetolian and the Achaean Leagues were accompanied by some kind of commercial fair or market. Under Roman rule a provincial governor’s judicial progresses attracted trade: “the courts are in session every year, bringing together a numberless throng — litigants, jurymen, orators, nobles, attendants, slaves, pimps, muleteers, hucksters, whores, and craftsmen. Those who have any goods to sell can get the highest prices; nothing in the city is out of work, neither the draught animals nor the households nor the women. This contributes noticeably to prosperity”, Dio observed. But the most important fairs continued to be the religious ones. We hear of the struggles of conscience that Christians faced in attending them. “A believer must not go near a fair, except in order to buy a slave (and thus save his soul) or to buy one of the necessities of life”, according to the *Apostolic Constitutions* of the 4th century AD. Yet they attended; and Christian festivals slowly replaced pagan ones as the occasion for fairs. In Byzantine Greece the fair that began six days before St Demetrius’s Day at Thessalonica attracted traders from Catalonia, France, and Italy. The Ottoman traveller Evliya Çelebi described the annual fair of the salt beef merchants, “infidels of Moldavia and Wallachia”, held outside the walls of Constantinople for 40 days beginning from St Demetrius.

Thus fairs have a long history in Greece. Periodic markets, weekly to monthly, are less talked of. In Roman times there may have been such markets in northern Greece. Certainly they existed near the Aegean coast of Asia Minor, where inscriptions record ten-day markets around Magnesia and monthly markets elsewhere.

Cities of some size certainly supported daily markets in Classical times, as they do now. Written sources refer to various specialized markets: a cattle market at Sparta; a covered market (stoa) specializing in spices at Megalopolis.

Classical sources are most informative about the market at Athens. This occupied a considerable area, centring on the Agora. It included sections such as *eis tous ichthyas*, the fish market, and *eis toupasa*, delicatessen. There was a distinct women’s market: maids could be hired there. Characters in Athenian Middle and New Comedy spent a good deal of time boasting of their success at market or complaining of the price of fish. Athens also held a monthly fair or market on the day of the new moon (*noumenia*) at which slaves and animals were

sold: a slave acquired on that day might be named *Noumenios*.

In coastal cities, and in the Greek islands, periodic markets are not recorded in ancient times and are not common nowadays. Trade here has been seaborne, dependent on sea conditions, and thus unsuited to a market timetable. Instead, the practice is for a market to be set up at the harbour when ships arrive. This is seen in many places today when a ferry puts in, often signalling its arrival with a blast on the foghorn. The evidence in Classical texts is of the arrival of fishing boats being announced by a harbour bell. Early sources, beginning with Homer and Herodotus, tell stories that depend on this practice of impromptu harbour markets.

Family

Throughout recorded Greek history, the family has functioned as the central social unit. In ancient Greek there is, however, no word for "family" in today's sense, and the nearest equivalent, *oikos* or "household", refers not only to the human members of the family group but also to its property, be that house, land, tombs, slaves, or animals. This is evident as early as Homer's *Odyssey*. Crucial, therefore, to the continuation of the *oikos* was the production of legitimate heirs to whom the family property could be passed. Ancient Greek society was patriarchal, as indeed it has been until almost the present day. However, whereas in Homer the male hero stood alone at the head of his *oikos*, the *oikos* of the Archaic and Classical Greek polis, or city state, was tied closely to the social, military, civic, and religious structure of the city. While the polis provided protection from enemies to the *oikos* and its property, the *oikos* provided the polis with its citizen soldiers. The *oikos* of the Archaic and Classical periods therefore functioned on both a public and a private level. Although patriarchal, the *oikos* nevertheless laid great value on the woman's role as wife and mother. Proper and chaste behaviour was highly prized, indeed expected, by Greek society as a means of ensuring legitimate family succession and inheritance. The woman also played

a central role in household management, and in the conduct of proper death ritual (preparation of the corpse and mourning) for deceased family members.

Marriage in ancient Greece, and throughout subsequent Greek history, was based on the principle of monogamy and, as again until recent times, was an arranged affair involving agreement between the bride and groom's families; this included agreement on the dowry, usually a sum of money, that the woman would bring to the marriage. At Athens during the Classical period the bridegroom was generally aged around 30 while, in order to ensure her virginal status, the bride was usually half his age. Following the wedding, the bride moved from her father's house to that of her husband. There, although sharing the family house and concerns, man and wife led distinctly different lives, for while the adult male participated daily in the public citizen life of Athens, the female remained at home, leading a private existence concerned only with domestic matters. In the case of an unsatisfactory marriage divorce was possible and could be instigated, in theory at least, by either husband or wife. Athenian law required that on divorce a woman's dowry be returned to her; this protected her from becoming destitute and made her an attractive candidate for remarriage. Procreation of children within marriage was highly important, not only to safeguard the inheritance of family property, but also to provide care for the parents in old age: indeed the nuclear family was often extended to include elderly relatives within the household. The production of children, furthermore, ensured that the older generation would receive the appropriate death ritual and proper burial when the time came, and that the family tomb cult would be maintained. Since inheritance of family property operated through the male line, sons were especially desired; daughters, by contrast, had to be provided with a dowry. It has therefore been suggested that infant exposure, which is known to have occurred, involved more female than male children, though hard evidence for this is not forthcoming. It is also worth noting that, since all sons had an equal right to share in their father's property, the production of a number of male children could also be considered problematic. Inheritance matters were protected by complex legislation, necessary since the polis was founded on an agrarian basis; where, for example, a family lacked a male heir, a son could be adopted or, alternatively, property could pass through a daughter to her sons.

As a result of a bias in our evidence, most of what we know about the family in Classical Greece relates to the Athenian upper class. It is, therefore, interesting to compare the case of Sparta, where the state claimed a much greater degree of involvement in the family and household matters of the Spartan upper class. The underlying reason

for this was the maintenance at Sparta of a professional standing army. Following marriage, which was compulsory, the groom returned to a communal military life until he was 30. Consequently, husband and wife did not live together for a number of years, resulting in Spartan women leading more public and active lives than their Athenian counterparts, and being able to exercise a degree of control over family property matters. They were, furthermore, able to own property and wealth independently. Unlike Athenians, Spartan women were not married until they were fully grown, and then generally to a man of similar age. According to Xenophon, a Spartan man could have children with the wife of another consenting Spartan male, and a young wife married to an elderly husband might also produce children with another man: these arrangements probably operated to combat cases of infertility, adoption of children also being practised. The decision to expose a child rested not with the parents, but rather with the tribal elders who had always in mind the military requirements of the Spartan community. Furthermore, the education of male children was not determined by their parents but by the state, which removed boys in their seventh year to communal barracks where they received a military, as well as traditional, education.

The Hellenistic period in Greek lands witnessed, as seen in the plays of Menander and others, a shift of focus towards the family's and individual's private affairs. This occurred as the polis structure weakened and the relationship between polis and *oikos* changed. For example, whereas in the Classical period at Athens one's membership of the polis depended on membership of an Athenian citizen family, in the Hellenistic period some states were happy to bestow citizenship on individuals descended from non-citizen parents. Furthermore, women in many states gained the ability to own and manage wealth and property in their own right, resulting in a new emphasis on their individual, as well as family, identity and worth.

During the Roman period the family underwent further evolution due, in part, to the introduction of Christianity. The most profound change revolved around the alternative roles now open to women. In the 4th century AD the emperor Constantine decreed that a woman did not have to marry, but could rather devote herself to the Church as a bride of Christ. This in turn impacted on inheritance law, for such women could now also bequeath property to the Church instead of to relatives. For the first time, priestesses aside, women could reject marriage and childbearing: either they could continue to live in their paternal home, or choose solitude, or reside within a community of women. This increase in celibacy and non-family life in the early Christian period applied equally to men as to women. Most men and women did, however, continue to marry and produce children.

Marriages, as before, were arranged and contracts, recording financial agreements, were drawn up. As earlier, most girls were married by the time they reached 16, and a legal minimum of 12 years was set for brides. Now for the first time, Christian teaching established the requirement of fidelity within marriage for men as well as for women; further, in AD 326 Constantine went so far as to outlaw the ancient practice of concubinage, that is a stable sexual liaison between a married man and a woman not his wife. Many subsequent emperors, however, regarded this practice with greater tolerance. Divorce law, particularly relating to the grounds on which divorce was permitted, changed many times during the early Christian period, due perhaps in part to the influence of Christian teaching. Nevertheless, even though Christian belief stressed the indissolubility of human marriage as a reflection of the union between Christ and the Church, divorce continued to be a legal option. In the event of divorce, a woman's dowry had to be returned to her as before, while the children officially remained under their father's authority although they did not necessarily live with him. Abortion and infant exposure were now regarded with strong moral disapproval, though again the legal response was more liberal. Encouraged by the Church, some provision of care for orphans developed through private and local charity.

Fasts

The act of fasting in antiquity was prevalent among the Greeks and was primarily associated with rites of mourning. Its main purpose seemed to be an apotropaic one; the mourning fast was seen as a powerful medium of warding off demonic spirits that could enter the body through eating and drinking. Fasting was also considered by the ancient Greeks to be a means of expiation and purification that rendered the faster fit for union with the deities. In the festival of Thesmophoria, an Athenian cult in honour of Demeter, a one-day fast was demanded of women. In the Eleusinian mysteries fasting was imposed on the initiate in order to render them worthy of receiving the sacramental drink. Another context in which abstinence from food was required in antiquity was that of manticism. It was believed that the one who fasted was more receptive to divine revelation. Thus, preparation by austere fasting was a necessary precondition for the dream oracles through which the gods unveiled the future to their devotees and made promises to them. Yet, fasting in antiquity, apart from its ritual functions, had also therapeutic ones. The Greek philosophers often praised self-restraint for hygienic purposes and recommended fasting for the sake of philosophy. Notwithstanding such philosophical ideas, fasting in antiquity did not seem to have an ethical pertinence.

Fate

The Greek words for fate – *moira*, *moros*, and *heimarmene aisa* – mean “portion”. Apportionment is often said to be the work of gods, but the relation between fate and the other divine powers presented an acute problem to Greek thought. Usually a daimon is held responsible for an individual’s allotted fate but often *moira* is the work of Zeus, the highest divinity of the Greek pantheon. Equally often *moira* appears to

be determined independently of Zeus, and any interference with it amounts to upsetting the natural order of things (*Iliad*, 8. 70ff., 16. 435f., 22. 174f.). In this sense fate is regarded as being arbitrary and irrational, and therefore inexplicable and more powerful than the gods. A power closely similar to fate was fortune (*tyche*), and often, especially in later literature, the distinction between fate and fortune is vague. Although fortune can crucially affect somebody, originally its realm is that of chance, whereas the realm of fate is that of (godly) determination and strict necessity (cf. Aristotle *Nichomachean Ethics*, 1099b10–12). Throughout the history of Greek culture fate is seen as determining both sad and happy events with a power of universal law. Fate determines first and foremost death, and sometimes (e.g. in inscriptions) it is identical with death. The belief in the inevitability of man's allotted fate is of fundamental importance in Greek tradition and permeates Greek literature and thought from the Homeric age through the Classical and Hellenistic era up to modern times. It is striking to see that formulaic phrases and such terms as *moira* and *tyche* pervade all periods of Greek cultural history.

In the Homeric poems fate, *moira* or *aisa*, is neither a person nor a god or goddess but a fact. *Moira* appears in two forms: as a synonym for death, but also as signifying what is seemly or fit for someone, e.g. a share of honour. In its first form, *moira* is often found in formulaic phrases as the cause of death and destruction (*Iliad*, 4. 517, 19. 409–10, 23. 119). The hero frequently begs the gods for a reversal of fate (*Iliad*, 19. 287–302, 315–39) and often is able to reverse it or to worsen it by his own deeds (*Odyssey*, 9. 32f.), a situation described as *hyper moron* (beyond fate). In its second form *moira* reveals an ethical significance. One has to act and speak in accordance with one's own *moira*, taking into account social hierarchy, social and religious values, understanding of one's place and role in the social context.

Already in Hesiod fate becomes personalized in the figures of three old women spinning, the Moirai, the children of Night (*Theogony*, 219f.) or of Zeus and Themis (Righteousness) (*Theogony*, 904ff.); they were considered goddesses, able to “assign mortal men at their birth both good and ill” (*Theogony*, 217). Their functions are indicated by their names: Clotho spins the thread of life, Lachesis apportions destiny, Atropos makes final decisions. The Moirai appear in Greek iconography as early as the 6th century BC, and we know of the existence of their statues in various Greek cities, witnessing the cult of the Moirai. The power of Moira is stressed in the victory songs of Pindar and especially in tragedy. Aeschylus reserves a highly prestigious position for the Fates in the pantheon (*Eumenides*, 956f.), making even Zeus their dependant (*Prometheus Vincetus*, 511). The tragic heroes Ajax, Oedipus, Antigone, Philoctetes, and Alcestis lament

their own fate and sing their own dirges. In Aeschylus' *Agamemnon*, Cassandra, endowed with the ability to prophesy, knows and laments her own fate and Agamemnon's.

The notion of *moira* plays a major role in funerary inscriptions and in the tradition of the literary epigram as well as in the magical papyri. A number of different formulae, many of them Homeric, are employed in funerary inscriptions to describe the work of Moira. Sometimes the deceased or the mourner directly addresses and reproaches Moira as the agent of their death. In funerary epigrams sentiments of grief are expressed for the inevitable action of Moira, especially when concerning premature death. From the 4th century Fortune appears to supersede Moira, especially in some genres, such as comedy. The role of Moira and Fortune is highlighted in the stories of love and adventure of the Hellenistic and late antique novels. Fortune plays an active role in these novels as a personified agent, and dramatic tension is created by the innumerable reversals of fortune against which the heroes and heroines often protest.

The problem of fate appears from very early on in Greek philosophy. Parmenides maintained that fate determines that nothing exists but the being (fr. 8. 36–38). The problem of fate is first seriously addressed by the Stoics. For them the way the world evolves is determined by a divine plan which includes our choices and decisions. Yet the divine plan is contingent on our own choices. Something can be dependent on us and still fated (but not necessitated) since a person's soul, together with external circumstances, is part of the network of fate. The human agent has power only over his or her own impressions. One may choose freely among them but whether one succeeds in realizing them is a matter of divine providence. Thus one is free if one does not desire anything beyond one's power (Epictetus, *Dissertationes*, 4. 7. 9). For the Stoics one exercises one's free will only when one gives assent to the right impression, but to act rightly or virtuously is not in one's power. The Stoic notion of fate was highly influential but was also polemicized by the Epicureans who denied the existence of a godly imposed fate (*D.L.X.*, 133–134). They argued that to the extent that men are rational their actions are voluntary, in the sense that they are under rational control. Later Alexander of Aphrodisias in his *On Fate* (c. AD 200), which argues that the Stoic view seriously restricts freedom.

Federal States

The federal state was a major form of organization of the ancient Greek state. Its main characteristic was the union of various city states or tribal communities to form a single entity, which exercised certain political powers on behalf of its member states. By definition, the constituent parts of federal states enjoyed a specific degree of autonomy, including local government and the use of local citizenship, while the federal authorities were genuinely concerned with foreign policy. Political participation of the member states was achieved by the means of equal or proportional representation. Federal states were always founded on the basis of earlier Greek tribes – for instance the Boeotians, Arcadians, Achaeans (see below) – as a consequence of which tribal cults and ceremonies continued to play a prominent role in federal affairs. There is no single term to denote a federal state in ancient Greek. In the 5th and 4th centuries BC the term *koinon* is predominant, while in the Hellenistic period *ethnos* and *sympoliteia* are found.

One of the earliest – and one of the most important – federal states was the Boeotian League. Its chief officials, the Boeotarchs, appear to have been established by 519 BC, when Boeotian troops tried to incorporate Plataea into the Theban-led confederacy. Due to Theban Medism (support for Persia) in 480, the federal state was weakened after the Persian Wars. There was no official dissolution, but its political influence seems to have perished, and Boeotia came under Athenian domination in 457. A new confederacy was founded after

the liberation from Athens a decade later, its polity being the best-attested form of representative government in antiquity. All Boeotia was divided into nine (in 427 extended to 11) electorate units, each of which provided one Boeotarch, 60 councillors, 1000 hoplites, 100 horsemen, and a certain number of jurors to the federal government. Active citizenship was confined to those who served in the federal troops (eligibility established by a so-called hoplite census). The constituencies were shared among the poleis according to their population. Both Orchomenus and Thebes were permitted two districts in 447, while smaller cities administered one or sometimes only a third of a district. In 386 the Spartans dissolved the federation on the grounds of the King's Peace. The league was soon reestablished in the aftermath of the Theban revolution in 379. Its main political institution was the board of Boeotarchs, now reduced to seven. The representative councils were not revived. Instead, decision making rested with the primary democratic assembly in Thebes, which was open to all Boeotian citizens. Theban leadership soon became overwhelming. After the destruction of several poleis (most notably Orchomenus in 364), Boeotia was dominated by the Thebans alone. The sources tend to speak of the league in terms of a Theban *synteleia* (subordinate group), which indicates an amalgamation of polis structures and federal institutions. The confederacy was maintained in the Hellenistic age (despite the destruction of Thebes by Alexander in 335 BC), though its constitutional outline profoundly changed. At the head of government stood a board of seven (sometimes eight) Boeotarchs, who now were confined to one representative from any specific city. Next to them, the office of a military *strategos* (general) and a federal *synedrion* (council) were introduced. Another important improvement was the practice of taking the vote in the federal *synedrion* by cities. Effectively, no single polis seems to have dominated the federation until it was dissolved by Rome in 146 BC. In later periods the Boeotian *koinon* obtained cultural functions, such as hosting religious festivals.

In the north the Thessalian League was the leading federal state. It seems to have been established by the beginning of 5th century BC, emerging from the feudal kingdom of Thessaly. Its proper territory was divided into four tetrads (Thessaliotis, Phthiotis, Pelasgiotis, Hestiaeotis), each headed by a tetrarch. Initially, the office was monopolized by local aristocratic families (for instance the Aleuads of Larissa), who owned the vast majority of the Thessalian *kleroi* (land lots). Of these, each *kleros* was required to furnish 40 horsemen and 80 hoplites to the federal troops. With the growing importance of the *koinon*, the tetrarchs were replaced by four annual polemarchs. They were elected by the federal primary assembly of all free Thessalians.

Like the polemarchs, the *tagos* (the head of state), was elective. His office embodied the supreme sovereignty of the league. However, the sources attest certain *atageiai*, which implies that there were substantial periods without a *tagos*. In the 4th century several tyrants of Pherae, most prominently Jason, sought to establish a lasting *tageia* over Thessaly. In resistance to their attempts, the league appealed to Philip II of Macedon, who was elected as federal archon and defeated the Pheraeans in a pitched battle in 352. Under his archonship the Thessalian League soon became a Macedonian protectorate. The tetrarchy was reintroduced, its officials being appointed by Philip. Further, he initiated a system of “decarchies” (boards of ten) in each of the cities, to anchor Macedonian interests. The next major reform was enforced by Flamininus in 194. The league, now detached from Macedon, obtained representative government, including a federal *synedrion* of city delegates. Apart from judicial and deliberative activities, its main objective was the annual election of the head of government, the *strategos*. Unlike most confederacies, this polity was officially maintained throughout the Roman empire, affiliated to the province of Achaia.

The Arcadian League presents a much shorter history. Founded after the Battle of Leuctra in 371, it was brought about by Mantinaean and Tegean democrats, who sought to unite their poleis against Sparta. To prevent rivalries between these prominent member cities, Megalopolis was founded as a new federal capital. The central political body was the primary assembly, the *myrioi* (“ten thousand” – that is, “all”) in Megalopolis. This assembly was attended to a large extent by members of the federal army, the *eparitoi*, a mercenary force paid by the confederacy. At the head of the troops stood the *strategos*, the federal commander-in-chief. The most interesting institution was the federal *boule* (council) of 50 *damiourgoi* (councillors), who represented the cities approximately in proportion to their population. Despite this sophisticated combination of direct and representative bodies, the Arcadian League was soon crushed by internal civil strife and disintegrated in 364/63.

More successful was the Aetolian League, which – as well as its great opponent, the Achaean League – played a major role in the politics of Hellenistic Greece. Its origins can be traced back to the late 5th century BC, when Aetolia initially established some sort of federal government. The *koinon* had both tribal and city members. Foreign policy was in the hands of the federal state. The confederacy held two annual meetings (*Thermika* and *Panaitolika*), to determine the league’s policy and to elect military commanders. As early as 327, a federal *boule* is attested, and it is clear that this council served as the administrative body. This constitutional framework was the basis for

further development of the federal state in the 3rd century, when its territory expanded considerably. While maintaining a remarkable degree of local autonomy, new members (such as the Lokrian district) were conceded an equivalent status to the genuine Aetolian tribes and cities. More distant members were granted the status of *isopoliteia* (state with reciprocal civil rights). Consequently, the federal council soon grew from its original extent to a size of possibly up to 1000 representatives. For practical reasons, a certain number of these served as executive councillors (*apokletoi*). The chief magistrates were the *strategos* and the *hipparchos* (cavalry commander), both elected by the federal primary assembly in Thermon. In the 2nd century BC the Aetolian league increasingly came under Roman power. After the reduction of its territory to Aetolia proper in 167, the federal state lost its sovereignty and was finally incorporated into the province of Achaea under the principate.
